According to Kouzes and Posner (2003), leadership is about making choices, and people make choices based on their worldview. In this regard, Mostovicz et al. (2009) suggested two worldviews: Theta and Lambda worldviews. The Theta worldview is motivated by the need for achievement, and the Lambda worldview is motivated by the need for affiliation. Whereas Thetas have a socially oriented motivation, Lambdas are individually motivated (Mostovicz et al. 2009). Interposing the Theta and Lambda worldviews with the leader timeline would surface out the critical agendas for the leadership development of individuals (Mostovicz et al. 2009).

Leadership development is a progressive process of learning new skills, abilities, and behaviors (Petrie 2014). While this can be attained by means of horizontal development, a more significant aspect of leadership development is making sense of the world in more complex and inclusive ways, a manner in which their minds grow bigger (Petrie 2014). This can be accomplished by stages that individuals go through as a result of experience and hence is attained by means of vertical development. As cited by Petrie (2015: 11), "today's horizontal development within a mindset must give way to the vertical development of bigger minds." While horizontal development can be attained through short-term leadership development training, vertical development is best attained through a progressive system of leadership studies.

Based on the foregoing premises, a leadership development program based on a synergistic framework was developed (Fig. 1). The framework takes into account the vertical development, the humanistic approach, and the leader's timeline in constructing the conceptual, strategic, and operational edifice of the program. This has to be laid upon a strong foundation which is anchored on the context in which the program is implemented. To ensure continuous quality improvement, the PDCA cycle (Deming 1986) was employed in every aspect of design and delivery processes.

## Contextual Considerations

The UAE and the rest of the Arab world are not deprived of leadership development programs. In fact, the past decade witnessed the mushrooming of leadership development programs all throughout the Middle East and North Africa creating a cottage industry of leadership development managed by a diversity of providers and catered to by a broad spectrum of consumers. In short, the region is saturated with leadership development programs (Al-Dabbagh and Asaad 2010). In a broad assessment of leadership programs in the Arab world, Al-Dabbagh and Asaad (2010) developed a typology that reflected an array of programs spanning the MENA region. Their typology shows six main types of providers of leadership development programs in the Arab world which includes governments, educational institutions, private sector organizations, commercial training programs or centers, international organizations, and local and regional

**Curriculum Design for Leadership Education in UAE, Fig. 1** The framework of program development

non-governmental organizations. Each type of provider caters to a different target group and employs a distinct set of characteristics that differentiate it from others (Al-Dabbagh and Asaad 2010: 5).

In their assessment, Al-Dabbagh and Asaad (2010) surfaced some salient points that were relevant to this paper. They observed that the programs offered are "tailor-made" to serve specific development purposes. More often than not, these programs are divorced from institutional context. The programs experiment with addressing local needs by outsourcing to Western leadership training providers, thereby creating a tension between the dominant Western perspectives on leadership and local needs and realities. The approaches to the programs targeted intrapersonal competencies of individuals rather than transforming the relationships between people. In this regard, leadership is understood as a cause rather than an effect or an emerging property of effective systems design. Hence they asserted that "one of the main challenges for leadership development programs in the region is to better understand and conceptualize relational approaches to leadership development" (Al-Dabbagh and Asaad 2010: 11). In the light of the foregoing considerations, the leadership program herewith described was designed to meet both the theoretical and contextual requirements.

## The Leadership Program

The United Arab Emirates University started offering a comprehensive bachelor's degree in Leadership in 2009. It has the distinction of being the only college in the United Arab Emirates to offer a bachelor's degree in leadership. The program is hosted by the College of Humanities and Social Sciences with the goal of providing students with an innovative curriculum that focuses on the study of leadership in the context of an ever-changing society. It offers a humanistic approach to the study of leadership and draws from research in a number of fields in humanities and social sciences including sociology, psychology, philosophy, history, mass communication, linguistics, and political science. Since no one discipline holds mastery of leadership and social issues, students are expected to engage content, skills, thinking processes, and assessments by exploring connections among several different disciplines. The leadership program's objective is to provide students with the needed knowledge and skills to enact leadership roles in their respective workplaces and in the community, nation, region, and global spheres. The emphasis of the program is on assisting students in realizing their potential and responsibility for leadership by providing them with a comprehensive educational experience based on

both theory and practical application. The program was designed to immerse students in a challenging and stimulating intellectual environment and equip graduates with skills to achieve personal, professional, and citizenship excellence in their post-university careers.

### Program Overview

The leadership program curriculum was designed mainly by an interdisciplinary committee of ten faculty members from different disciplines at the College of Humanities and Social Sciences. Their views and the results of their frequent meetings led to the development of the current program's curriculum. This process ensured that the program's curriculum met the expectations of all disciplines within the college.

One of the significant components of the program was to go beyond the presentation of traditional college courses that convey knowledge. This type of delivery largely belongs to the domain of pedagogy. Considering that college students are young adults, the program took a shift in epistemology and employed instructional technology which engaged the principles of andragogy (Knowles 1990) and experiential learning (Kolb 1984). The program's classroom experience stressed excellent teaching, academic rigor, and active learning. Outside the classroom, students are immersed in a rich array of cultural programming that is supported by United Arab Emirates University. The program required students to engage in community service to develop social efficacy and an awareness of the essential relationship between privilege and responsibility.

### Planning

Consistent with a general rubric of developing the curriculum, the planning process involved the following activities: university-based reflections, content analysis, and independent reviews.

**University-based reflections**. In this stage, inputs from course teachers were solicited in the form of a report regarding the course description and requirements, contents, resources and technology, and teaching strategies. This was later followed by interviews to determine the views of the teachers on the satisfaction and fulfillment of the course objectives. An evaluation of the outcomes of the course in terms of satisfaction, performance, and outreach was later done by the 14 students who graduated during the period from 2012 to 2013, all of whom were female UAE nationals.

**Content analysis**. Content analysis and satisfaction of all objectives and outcomes of courses in accordance with the main goals of the program were performed by ten faculty colleagues from different disciplines who participated in our internal reviews. Review and analysis were done to determine the academic and organizational obstacles that the program faced over the 5 years of program implementation. The program was also reviewed vis-à-vis the top 100 US universities' leadership programs as well as top 100 international universities by utilizing the portal used to check the top 100 international and US universities (Your Gateway to Universities and Colleges 2013).

**Independent reviews**. Independent reviews were done by experts in the field. The external evaluators consisted of the Director of Leadership Programs, University of Arizona; Dean of the Jepson School of Leadership Studies; a Professor from Concordia University Chicago; and an Associate Professor of the Department of Political Science, Eastern University.

### Requirements

**Faculty**. In order to achieve program objectives, the faculty members had to be highly qualified. In addition to holding the normal and appropriate credentials for teaching at the university, they must have the academic qualification and the experience to teach leadership courses that draw from broad scholarship in the humanities and social sciences. Given the still-developing status of the field, it is crucial that faculty demonstrated a keen interest and possess innovative experience with leadership issues. They must also possess an extraordinary ability to inspire students, fellow faculty, and the university community about the valuable contributions of the field. In addition, they should demonstrate leadership themselves in collaboratively promoting the discipline

through active participation in conferences, professional association, and other activities.

**Admission requirements**. Candidates for bachelor's degree in leadership must apply for admission to the leadership program during the spring semester of their second year. They must fill out an application form and provide all the required information by the first week of the spring semester. Students wishing to major in leadership are evaluated based on the following criteria:

- Must have completed their university general requirements, general education requirements, and College of Humanities and Social Sciences requirements.
- Must have earned a minimum cumulative grade point average (GPA) of 3.0 in courses taken at the university.
- Demonstrate English language skills that meet a minimum IELTS score of 5.5.
- Demonstrate first language skills.

## Course Model

**Course goals**. Based on the analysis of the internal and external inputs by the faculty and experts, respectively, and researches on best practices in leadership studies and development worldwide, the learning goals were formulated that reflected the intrapersonal developmental needs as well as the interpersonal ones. It also considered the organizational aspects of team working and team leading at the same time. Accordingly, the students of the leadership program are expected to accomplish the learning goals and outcomes as shown in Table 1. Based on these goals, the course design for the interdisciplinary major in leadership shown in Table 2 was implemented. As a corollary, Table 3 shows the course design for those who opt to take the interdisciplinary leadership program as a minor field of study.

On the whole, the processes employed in the development of the leadership program were a synergy of conceptual, strategic, and operational elements that defined the program while paying close attention to the local and global cultural context in which the program is embedded in. The conceptual requirements were realized in

**Curriculum Design for Leadership Education in UAE, Table 1** Learning goals and outcomes

| Goals | Outcomes |
|---|---|
| **Goal 1 (G1):** Develop personal leadership skills | 1. Develop goals and priorities to balance competing demands<br>2. Recognize responsibility and accountability for own performance and behavior<br>3. Assess the need for continuous learning and professional growth<br>4. Demonstrate career interests and goals and awareness of program-related career possibilities |
| **Goal 2 (G2):** Develop communication leadership skills | 1. Develop effective communication with others<br>2. Identify mistakes and successes, and adjust future plans accordingly<br>3. Explain ideas and materials effectively, both orally and in writing<br>4. Express information in a variety of forms – e.g., word, graphs, charts, diagrams<br>5. Demonstrate clear and effective writing of leadership reports |
| **Goal 3 (G3):** Develop teamwork skills | 1. Employ teamwork skills<br>2. Demonstrate respect for different opinions and arguments<br>3. Evaluate the performance of others<br>4. Generate problem solutions and conflict resolution<br>5. Demonstrate the ability to motivate others |
| **Goal 4 (G4):** Explain theories of leadership and society | 1. Discuss the different theories, concepts, and principles of leadership<br>2. Examine the political, economic, social, and environmental aspects of local and international society<br>3. Examine leadership theories and relevant knowledge |
| **Goal 5 (G5):** Develop effective engagement in society | 1. Apply values of hard work, honesty, and integrity<br>2. Define the role of volunteerism<br>3. Show effective communication in the diverse work environment<br>4. Initiate positive changes in society |
| **Goal 6 (G6):** Develop creativity and problem-solving skills | 1. Assess different situations and problems<br>2. Identify the root cause of a problem or issue<br>3. Operate innovative and creative solutions to problems<br>4. Analyze regional and global issues<br>5. Interpret different points of view/ interdisciplinary perspectives<br>6. Synthesize facts<br>7. Analyze arguments and actions |

**Curriculum Design for Leadership Education in UAE, Table 2** Course design for interdisciplinary major in leadership

| Main courses to be studied (3 CH each), (all compulsary but not the last two courses) | Goals/ courses associated | Suggested subjects to be fulfilled from other disciplines (to select 5 courses) | Goals/ courses associated |
|---|---|---|---|
| 1. Principles of leadership | G1, G2, G4 | Sociology of organizations (sociology) | G3 |
| 2. Identity in a multicultural world | G1, G4 | Social psychology (psychology) | G2, G4 |
| 3. Organizational leadership | G3, G4, G6 | Government and politics (political science) | G4, G1 |
| 4. Interpersonal leadership | G1, G2 | International organizations (political science) | G2, G6 |
| 5. Values and ethics of leadership | G1, G2, G3, G5 | Contemporary civilization (history) | G2, G4 |
| 6. Societies and governments in a globalized world | G4, G5 | Principles of economics (economics) | G5 |
| 7. Leadership communication | G2, G5, G6 | Social entrepreneurship (business administration) | G1, G3, G6 |
| 8. Field experience | G3, G5, G6 | Fundamentals of management (management) | G2, G3 |
| 9. Internship | G3, G5, G6 | Civilizations in dialogue (leadership) | G2, G5 |
| 10. Capstone course (faculty requirement) | All goals | Twenty-first century challenges: Environment (leadership) | G3, G6 |

**Curriculum Design for Leadership Education in UAE, Table 3** Course design for a minor in leadership

| Main courses to be studied (3 CH each), (all compulsive but not the last two courses | Goals/ courses associated | Suggested courses as an elective to be fulfilled from other disciplines (to select 1 course) | Goals/ courses associated |
|---|---|---|---|
| 1. Principles of leadership | G1, G2, G4 | Field experience (leadership) | G3, G5, G6 |
| 2. Identity in a multicultural world | G1, G4 | Values and ethics of leadership (leadership) | G1, G2, G3, G5 |
| 3. Organizational leadership | G3, G4, G6 | (Course relates to specific specialty according to peripheral of major) | |
| 4. Interpersonal leadership | G1, G2 | | |
| 5. Leadership communication | G2, G5, G6 | | |
| •UAE society and government in globalized world | G4, G5 | Twenty-first century challenges: environment (leadership) | G3, G6 |
| •Principles of economics | G5 | Civilizations in dialogue (leadership) | G2, G5 |

the development of the program concept and the curriculum. The strategic requirements were met in the approach to design and delivery, and the operational requirements were attained through the collaborative efforts of various stakeholders in contributing to the development, implementation, and evaluation of the program. After 5 years of its implementation, a number of 32 students graduated from the bachelor's program with 20 having majored in leadership and society and 12 with minors in leadership and society.

## Assessment and Lessons Learned

The assessment begins with a note of caution regarding the "modifier" issue. As numerous disciplines recognize a need to integrate leadership as a topic of study, this apparent popularity at times may have the disadvantage of housing the discipline in many dispersed umbrellas, something that may be the main reason delaying it from becoming independently recognized and independent and authoritative. When a leadership

program serves a specific discipline (such as educational leadership, communication leadership, organizational leadership, engineering leadership, social leadership, economical leadership, etc.), there is a temptation for it to be used merely to provide scattered courses to fill up degree requirements. The need to construing a sound selection of courses as part of a dedicated program that is not "watered down" (Reggio 2011) is very important to crystallize leadership studies as a discipline. A related issue is the need to distinguish between leadership and management. Leading a discipline is much different from managing it, and so leadership is not simply an administrative subject.

Many fundamental questions remain in the pedagogy and content of the emerging field of leadership studies (Murphy and Riggio 2003). The early debates dealt with questions that typically arose when a leadership program is proposed. After facing foundational objections from those who doubted whether leadership can be learned and taught at all, huge debates also arose about the following: whether such teaching should occur at the post-graduate level (a view once held by this author); whether the education should create leaders ready to work immediately after graduation, or should it instead be building a potentiality for future opportunities; whether the education should aim to prepare people for work as supporters and facilitators for actual decision makers; whether leadership instruction should act to promote individual disciplines; and whether its primary focus should be to produce leaders which could spread into society and act as community leaders and pioneers. Another important argument arose about whether it should be a solo major, double major, co-major (e.g., Peace College/USA; Brungardt et al. 2006), or a minor. The latter is designed so that the greatest number of leadership candidates could take advantage of such learning opportunities.

The experience in the implementation of leadership program also surfaced the issue on the faculty. According to Riggio (2013), to be rigorous, the program has to be taught by accomplished faculty. The multidisciplinary nature of the program requires the faculty to have multidisciplinary expertise. The dearth of experienced faculty with multidisciplinary expertise was a real impediment to the program. It is just hoped that this could be addressed in the future by tapping on the services of graduates in advanced leadership courses or by deliberately motivating the faculty to pursue higher studies along this aspect of leadership development.

It is also worthy to note that there are no accrediting agencies as of yet that can ascertain the effectiveness of the program. This was addressed, however, through the assistance of a plurality of expert views from inside and outside the university. The program was already a collaborative effort from its inception, and this ensured that the program was not a single person's agenda but was truly faithful to the vision of the university to develop a new generation of leaders.

The program is not only multidisciplinary but transdisciplinary as well and here lies the crux of another issue: gauging the interdisciplinary mindset. In the absence of an established metrics to gauge the contribution of different disciplines in creating such a broad base of knowledge expected not only of a scholar but a leader as well, a parallel challenge is posed to scholars and researchers as well. Hopefully, further conversations on this emerging field will stimulate scholarly inquiry in this direction.

On the whole, the leadership program was successfully implemented according to design, but there is still room for its further enhancement. It is hoped that this endeavor will help spark further conversation and research on the leadership studies that can offer alternative reference points for those developing new leadership programs or enhancing existing ones.

## Conclusion

The leadership program is a bold and novel step taken by the UAEU to respond to the need for developing future leaders among the young in a country that is rapidly moving toward becoming a highly competitive knowledge-based economy. The sensitivity to the cultural context made the development process avoid the cut-and-paste approach from hundreds of programs existing on

the subject. Rather, the development process was evolutionary and synergistic. The program locates itself at the intersection of the conceptual, strategic, operational, and contextual dimensions associated with the multidisciplinary nature of the program. It highlights the synergy of these dimensions that is facilitated by the convergence of efforts of the university's internal stakeholders in collaboration with external experts, all of which led to the birth of the program. While growing pains were experienced in its implementation, these were taken not as stumbling blocks but stepping stones to further find ways to improve, enhance, and sustain program growth. Since leadership studies and development is an emerging field, the program can be likened to the Confucian first stem in a journey of a thousand miles. At best, it can serve as a model that can inform the development of similar initiatives in the Arab world, where the need to recast existing programs to make these more sensitive to context is fast becoming an imperative.

# Cybersecurity as Social Policy

Festus C. Obi
Texas Southern University, Houston, TX, USA

## Synonyms

Communication systems; Cyber-attack; Cybersecurity; Cyberspace; Cyberwar; Cyber-warfare; Digital information technology (DIT); Information and communication technology (ICT) defense; Information networks; Information security; Information superhighway; Information takedown; Information technology; Information-war; Insecurity; Internet; Malware; Security threats; Techno threats; Viral-attack; Virus; Vulnerability; World Wide Web

## Definition

Cybersecurity, cyber-warfare, information technology, malware, vulnerability, asymmetric war, cyber-criminal, and civilian warriors.

Cybersecurity: All proactive and reactive tools deployed by individuals, businesses, and governments to protect their information and communication systems from unauthorized access and harm.
Cyber-warfare: A war launched online by individuals, organizations, and states against their opponents who may be real or imagined. The objective of this war is to cripple the opponent economically, politically, and socially.
Information technology: Hard and software systems set up for exchange of information through audio, visual, or written form.
Malware: A worm attached to a file with the intent to destroy targeted information database or to steal important individual, business, or state information. The stolen information is used for gain by the entity that deployed the malware.
Vulnerability: A state of weakness that makes a thing or an individual an easy target.
Asymmetric warfare: Using a strong opponent's area of weakness to undermine or attack the strengths, thereby causing the opponent huge damage or defeat.
Cyber-criminal: A person or an organization that specializes in stealing personally identifying information, trade secrets, or classified information and using the same for economic or political gain.
Civil warriors: These are citizens of a country who use their in-depth knowledge of information technology to launch cyber-warfare against their country's enemies with the intention to cripple them economically, politically, and socially.
Bounded rationality: Ability to make decision based on facts or knowledge at the disposal of the decision-maker.
Social engineering: Using technology to create instruments for cyber-attacks such as phishing, pharming, hacking, etc.

## Introduction

When we talk about cybersecurity, we must also think of what necessitates cybersecurity as a response to certain risks and hazards inherent in the cyberspace. To understand cybersecurity and its essence, there is also a poignant need to grasp the underlying techno threats to individual, corporate, and governmental information and communication infrastructures and networks. Therefore, to think about cybersecurity or information and communication technology (ICT) defense, we must think about its predictor in the form of cyber-warfare or information warfare. A statement by Major-General Wang Pufeng of the Chinese Red Army (1995) captures some of the underlying factors for the rise of cyber-warfare across the globe, thus:

> In summary, our warfare methods must adapt to the needs of information warfare. We must use all types, forms, and methods of force, and especially make more use of nonlinear warfare and many types of information warfare methods which combine native and Western elements to use our strengths in order to attack the enemy's weaknesses, avoid being reactive, and strive for being active. In this way, it will be entirely possible for China to achieve

comprehensive victory over the enemy even under the conditions of inferiority in information technology.

The purpose of this article is to explain cybersecurity as the only known and legitimate response to cyber-attacks on individuals, businesses, or countries. This article will also explore cybersecurity as a social policy response. In this paper, individual cybersecurity expectations and official (governmental) efforts at combating cyber-attacks will also be addressed. Recommendations would also be made to enable countries of the world articulate cybersecurity policies and actions that will assure their nationals of their security in the cyberspace.

## Overview

Cyber-warfare, also known as information war (IW) or cyber-attack (CA), has become a global threat to critical infrastructures that make societies meet the needs of their peoples. Individuals, business entities, and nations are resorting to the information technology (especially the World Wide Web) as a means for settling scores, enriching themselves, stealing other businesses' trade secrets, and gaining military advantage over other nations – enemy nations. Before cyber-warfare became the most effective means of destroying opponents' economic, financial, and military capabilities through Internet attacks, individuals and nations fought with clubs, spears, bows and arrows, muskets, high-caliber guns and rifles, and nuclear arms. But since the end of the Cold War in the early 1990s and the popularization of personal computers and superhighway access, advanced computer users have resorted to a convenient way of launching paralyzing warfare against enemies from remote locations. Vulnerable individuals, businesses, and nations have become victims of cyber-warfare at some points in the past. Many more are falling victims because of the convenience of this style of warfare.

In the recent past, companies and countries have been attacked, further highlighting the obviousness of cyber-warfare and the seeming inabilities to defend against them. It is also hard to predict when the attack will occur. Several precautionary measures against cyber-warfare have proved inadequate. For instance, in August of 2012, the world's biggest oil producer known as Saudi Aramco suffered a viral attack which compelled the company to go offline so as to purge infected thousands of computers that comprised its information database. Iran's oil ministry had its computers attacked with the Flame malware. The attack on Iran's oil ministry's computers was credited to the United States and Israel (Porche III et al. 2012). The databases of retail giants Target and Neiman Marcus, among others, were attacked in late 2013. Over 60 million customers had their personally identifying information (PII) breached. Cyber-warfare has greater potentials for success and is more damaging to the economic, technological, and military capabilities of an enemy than nuclear war.

According to Porsche III et al. (2012), recent cyber-warfare has been against the energy industries – a pointer to the vulnerability of the computer networks of the victims and the capabilities of their attackers. Cyber-warfare is borderless. It takes place from remote locations and does not necessarily have to be launched from a computer. We live in a wireless world. That means that an attacker could launch debilitating worms from any wireless device so long as they know how. Cyber-warfare does not require military knowledge; it requires computer knowledge and the ability to create and transmit worms or viruses that would damage the opponents' capabilities. Hjortdal (2011) noted that cyber-warfare could be accidental and not intentional. What this means is that the attacker has no definitive enemy in mind but is out to attack whoever is vulnerable. Cyber-warfare is currently occurring at individual, industrial, and national levels and carried out by what Hoisington (2009) called "state and non-state actors" (p. 439). Countries like China, India, Iran, Israel, North Korea, Pakistan, Russia, and the United States among others are fully engaged in the war according to Billo and Chang (2004).

Cyber-warfare did not come out of the blues. It is a phenomenon that has its roots in the desire of nations to engage adversaries in nonnuclear

warfare. However, non-state participators have escalated cyber-warfare. Countries like China, Iran, Russia, and others view cyber-warfare as an asymmetric war strategy (Breen and Geltzer 2011). Countries like the United States are well advanced in technology, but this technological advancement presents areas of vulnerabilities that its opponents could capitalize on. Cyber-warfare could be traced to the then Soviet Union which in a bid for an upper hand in its nuclear arms' race with the United States hired a German computer Internet expert in 1972 to hack into US military computers. Since then hundreds of thousands of attacks have been launched against many opponents all over the world. In 1998, 3,000 Chinese hackers launched thousands of attacks against Indonesia as a protest against the anti-China demonstrations that occurred in the country.

This points to the fact that individuals might decide to carry out cyber-warfare against governments or corporations and vice versa. Instances abound of cyber-wars unleashed on governments as well as corporations. In 2008, Estonia was attacked to a point of paralysis. This compelled North Atlantic Treaty Organization (NATO), a military consortium of former allied countries during the World War II to change its policies to reflect the threats and urgency of action against cyber-warfare. In 2009, Georgia was attacked "cyberly" during its war against Russia over South Ossetia. Also in 2009, Stuxnet (a worm or virus) was released into Iranian computers with the suspected motive of disrupting Iran's nuclear enrichment. Israel and the United States were accused of releasing the Stuxnet virus.

## Cyber-Warfare and Cybersecurity

What causes cyber-warfare? Is it done out of mere pleasure trip? Just like every other war, there is always a real or imaginary cause. According to Billo and Chang (2004), there are different motivations for different countries in their launch of cyber-warfare. However, there are common threads that run through each motive. For countries like China, India, Iran, North Korea, Pakistan, and Russia, the primary motive for launching a cyber-warfare is to inflict incalculable financial and material losses on the opponent.

Billo and Chang found out in their study that countries referenced here aim at information takedown of an opponent by paralyzing its Internet connection, disrupting communication, compromising data, impeding commerce, and debilitating the information and technological infrastructure of the adversary. China, for instance, knows that it cannot match many countries in nuclear warfare but has the human capital to engage its adversaries in cyber-warfare. Its official doctrine of cyber-warfare states a determination to raise as many cyber warriors as possible to engage its enemies in asymmetric war, using China's nuclear weaknesses as an advantage for gaining information technological superiority over its stronger opponents. This entails being proactive and offensive in its tactical approach to combating its enemies through sheer overwhelming population of cyber warriors.

In its confrontation with Pakistan over Kashmir and Pakistan's ability to launch nuclear and technological warfare, India has made the pursuit of cybersecurity and warfare a part of its military doctrine. In 1998, India began a 10-year information plan that would give it an advantage over its opponents (see Billo and Chang 2004). This is also the case with other countries the authors studied. They all want to use the information superhighway to deal with their opponents, thereby making cyber-warfare to assume the same importance as nuclear warfare, if not more.

John H. Herz (1950) argued that uncertainty and bounded rationality (Inkster 2013) drive many individuals, corporations, and countries to insecurity. The produced insecurity creates feelings of threats which the fearful tends to fight against. Most of the security threats that lead to information warfare stem from uncertainty and insecurity within one's bounded rationality. At the moment, China and the United States, India and Pakistan, Russia and the United States, Israel and Iran, and Iran and the United States are all caught in the web of uncertainty and insecurity

emanating from real or perceived threats. This feeling of insecurity pushes each of these countries to not only defend itself against the other's security threats or cyber-warfare but to engage in a tactical offensive moves aimed at accumulating greater power and advantage.

The cyberspace is an open space. O'Connell (2012) pointed to the interconnectedness of computers on the information superhighway. This international open space of the Internet makes access to computers easy. It is just like an open door or closed but unlocked door which makes entry unhindered. So, according to scholars like O'Connell, Billo, and Chang, the Internet creates access for intruders and thieves whose intention is to wreak havocs on their victims. This state of the Internet is the biggest weapon for cyber-warfare. Individuals and countries that engage in cyber-warfare or attacks watch out for the vulnerabilities of an information infrastructure that give them unfettered access to personally identifying information, trade secrets, military and defense strategies, and security policies. The means to cyber-warfare is the Internet connection. Also, information security vulnerability is another means through which attackers launch cyber-warfare. This then indicates that information security is vital to warding off cyber-warfare. Cyber-warfare is inevitable especially with the frontier expanding to include non-state warriors. An advanced knowledge of information superhighway and how information securities work and their vulnerabilities are all it takes for an opponent to launch a successful cyber-warfare against an adversary. Warriors use malwares, viruses, or worms to disrupt opponent's data tables and corrupt the hard drive, the operating system, and all files available in the system. They also steal vital information if they are able to gain access as was the case innumerably in the past.

Being aware of an uncountable number of cyber warriors out there, it is very pertinent that the most effective response to cyber-warfare is cybersecurity. The depth, length, and breath of cyber-attack demands more vigilance and security measures that will thwart its onslaught. There are numerous critical infrastructures that sustain every country. Disruption of these critical and key infrastructures means destroying economic, political, and social ambience of a nation. As a result, it will be foolhardy for any country, business, and even individuals to navigate the cyberspace without some form of security in place. Cyber-warfare has reached such a feverish point that every country should deal with it as a national emergency requiring well-articulated and robust social policies and actions.

## Military and Civilian Warriors

Cyber-warfare was initially regarded as military warfare. It was engaged in by countries to gain military advantage over their opponents. When Soviet Union began cyber-attack in 1972, it did so to undermine America's nuclear superiority. It also had in mind to shift the turf of the war. So most countries as noted by Knapp and Boulton (2006) in their review of literature on cyber-warfare from 1990 to 2005 are seeing their business corporations increasingly becoming victims of this war. They explained that there has been a transition of cyber-warfare from being a non-bloody military weapon to an instrument of commercial and industrial espionage and destruction. This transformation of the scope of the war has far-reaching implications for business entities and their customers. Cyber-warfare has become a critical societal problem. Cronin (2002) argued that because cyber-warfare was first fought as military and defense maneuver, scholars failed to address the civilian dimension of the war.

Though countries and their military arms have been targeted by cyber warriors, victims have been mainly corporations and private organizations. Low entry security can account for one of the reasons for its prevalence. Overdependence on information technology by corporations has exacerbated their victimization. The Internet is overwhelmingly used for industrial espionage, organized crime, and public opinion management and against individuals and small businesses. With thousands of the world population becoming increasingly computer savvy, the rate of cyber-warfare rises.

## Trends of Cyber-Warfare

Existing literature shows that there are innumerable instances of computer-related incidents of cyber-warfare. Many of these incidents target individuals and civilian organizations. To compound this prevalence is the failure of victims of cyber-warfare to report the breaches. Sometimes, some corporations are unaware of their victimization until law enforcement agencies bring the occurrences to their knowledge. A survey by the Federal Bureau of Investigation (FBI) in 2002 showed that 90% of cyber-warfare attacks were known by victims, but only 34% reported them to law enforcement agencies (see Knapp and Boulton 2006). To say that hundreds of thousands of cyber-warfare takes place daily is repeating the obvious. The concern for users of the Internet and information highway is how to forestall against cyber-attacks. There are some attacks that may not be prevented but it helps to keep most of the enemies at bay.

## Meaning of Cybersecurity

The vastness of the cyberspace has created many vulnerabilities which have increased because of skill gap in protecting personal information and data. Ordinarily, cyberspace is supposed to be a safe place for exchange of personal and organizational information and communication. Unfortunately, cyber-criminals are unleashing myriads of threats to security of data online through what is known as social engineering. The state of the global cyberspace at the moment is one of heightened victimization. Millions of individuals and organizations are yearly victimized by an army of cyber-attackers. These attacks run into billions of dollars every year in losses. Cyber-attack is a global phenomenon that requires concerted individual, organizational, and governmental efforts at combating it. The integrity of data and personal privacy can only be protected and assured through cybersecurity. Cybersecurity is the protection of information and communication systems and networks, computers, data, and personally identifying information from threats of theft, attack and destruction, unauthorized access, or intrusion. Cybersecurity is a preventive mechanism for ensuring that networks and data are not attacked or stolen. It is not enough for users of cyberspace to depend on developers of an array of hardware and software for their security while in the cyberspace. Therefore, security of personal and business information and data while operating online is what cybersecurity entails. It is about safeguarding object identifiable information that will create serious breach for owners of such information. Cybersecurity is a response to the social problem of cyber-attacks. Without cybersecurity, users of cyberspace are like those bathing naked in the public. Every part of their bodies is exposed to onlookers. Since it is clear that cyber-attacks and online fraud will never abate rather they will exacerbate, policy decisions and actions by countries of the world against cyber-attacks are desired now more than ever. Individuals and corporate entities are also to take actions that will help protect their information and communication systems and networks.

## Individual Cybersecurity

Individuals should do all it takes to protect their personal computers and other digital information technology. It is not enough to depend on manufacturers for the protection of personal information and data in our present commodified world. Individuals should educate themselves on cybersecurity so that they will be able to deploy the necessary protective mechanism like advanced encryption systems for password. Whereas governments are expected to introduce policies, enact laws, and take actions to protect their critical infrastructure and key resources, individuals have to protect their personal computers and gadgets and data from attacks and theft. Depending on government alone to create social policies for cybersecurity is important, but it does not discount individual responsibilities as well.

## Organizational Cybersecurity

Business organizations do not wait for governments of the societies in which they operate to protect them and their information systems and networks from cyber-attacks before they do something. They have been making individual efforts to prevent their systems and business data from attack and theft. Except for brick and mortar businesses that do not treat cyber threats as serious problems, medium and large organizations have created information security departments that police their information and communication systems and networks and business from cyber-attacks. Unfortunately despite all the efforts put into the fight, cyber-criminals have successfully breached the systems and networks and databases of many large corporations. What this portends is that cyber-criminals need not be taken for granted. Cyber-criminals are working harder to circumvent any security mechanisms an organization has put in place. Businesses cannot wage the security war alone. More than ever, individuals and organizations expect their governments to be proactive in their engagements against cyber-attacks.

## Cybersecurity as Social Policy

There is no country of the world, be they developed or developing, that is immune from cyber-attack. The foregoing indicates the need for countries and corporations to engage and invest heavily in cybersecurity and critical infrastructure protection. Cybersecurity as I understand it is the strategic policy of a country, a corporation or an individual to defend its computer or information infrastructure from attack by virtual enemies. The attack which currently defines the scope of cyberterrorism is aimed at crippling an enemy politically, economically, and socially with possible moral panics as the result. Since cyber-attacks are social issues of monumental dimension that threaten the political, economic, and social well-being of a country and its citizens, every country of the world should articulate a cybersecurity policy for engaging cyber-criminals. Cybersecurity education of citizens should be a mandatory action. Every country should enact laws prohibiting and punishing cyber-attacks. Every country should formulate an information and communication framework that will prescribe minimum standards and guidelines for establishing information and communication networks and systems. As a social policy, each country of the world should partner with organizations and businesses operating within its jurisdiction in the fight against cyber-warfare or attacks. Also as a social policy, governments should create cybersecurity centers or fusion centers for detecting, preventing, and responding to acts of cyber-attacks. Governments should share cases of cyber-attack and its robust cybersecurity mechanisms with private entities and individuals in their jurisdictions. Cybersecurity should be the political policy, the military policy, the foreign affairs policy, and the economic policy of every country. There also should be global cybersecurity efforts and coalition that will help countries with advanced preventive cybersecurity share their methods with those countries which are still struggling with creating their cybersecurity policies.

## US Cybersecurity Policies

Countries such as Russia and China are said by cyber-warfare analysts to have made this form of aggression a national policy. The intriguing element of cyber-warfare is that it does not require military training; rather, all it takes is deep knowledge of the Internet and how the virtual world operates. By hacking or deploying worms (viruses) into enemy databases, adversaries can wipe away or corrupt the valuable strategic information of their opponents. Such information could be stolen and used in asymmetric war by militarily and economically weak opponents against more powerful adversaries. What a weak enemy country only needs to successfully attack a militarily strong country like the United States is an understanding of its vulnerability hidden within its strength.

It must be understood that individuals can launch successful cyberwar against a country,

but the difference in the case of China or Russia, for instance, is that it has turned its civilians into virtual soldiers and maintains a regiment of attackers who are 24/7 looking for signs of weakness in the technology infrastructure of their targets. The Pentagon's computers have been hacked although sensitive intelligence data were not lost. In the last 2 years alone, major American corporations like Target, Neiman Marcus, Home Depot, JPMorgan Chase, Kmart, etc., have had their databases hacked into and customer's vital object identifiable information stolen. These emergency events stemming from technological hazards need serious and stronger response. All these incidents could be summed up in one word – cyberterrorism.

Since the United States heavily depends on cyberspace and has made many real and imaginary enemies as the world's strongest military power, enemies who are savvy tech geeks are being recruited to undo the country's critical infrastructure and key resources. If America is successfully attacked technologically, a lot of things will go awry. That is why cybersecurity is very important in the country's military planning, foreign policy initiatives, and technological advancement. The country recognizes the importance of a national cybersecurity master plan in its National Strategy to Secure Cyberspace. This undertaking is etched in the Comprehensive National Cybersecurity Initiative (CNCI) as articulated in former President Bush's Presidential Directive 54. The Homeland Security Presidential Directive (HSPD) 7 outlined critical infrastructure identification, prioritization, and protection as the trifecta foci of the strategy. In 2010, the Obama administration expanded the scope of the master plan and coalesced the international community to understand the dangers of cyberterrorism as a singular big threat to the world.

Obama administration's policy review of the nation's cybersecurity underscores the following facts – the nation is at a crossroads; the status quo is no longer acceptable, the national dialogue on cybersecurity must begin today; the United States cannot succeed in securing cyberspace if it works in isolation; the federal government cannot entirely delegate or abrogate its role in securing the nation from a cyber incident or accident; working with the private sector, performance, and security objectives must be defined for the next-generation infrastructure; and the White House must lead the way forward. Cybersecurity comprises cyber-infrastructure consisting of electronic and communication systems, information and communication systems, and information technology critical functions.

America's cybersecurity initiatives are not solely undertaken by the Department of Homeland Security (DHS). There are other government departments engaged in the same cause. The DHS achieves these objectives through the National Cyber Incident Response Plan, the National Cybersecurity and Communications Integration Center (NCCIC), the US Computer Emergency Readiness Team (US-CERT), the EINSTEIN Program which alerts the US Government on intrusions into the Federal Executive Branch civilian networks – the program is on its third stage of development – the National Strategy for Trusted Identities in Cyberspace, and the Private Cyber Infrastructure Protection.

Other government departments involved in the cybersecurity and critical infrastructure protection are the Department of Defense (DOD), Department of Agriculture, Department of Commerce, Department of Education, Department of State, Environmental Protection Agency (EPA), Department of Energy, Department of Health and Human Services, Department of Interior, and Department of Treasury. Most of the departments have their individual initiatives and some in alliance with DHS. State, local, tribal, and territorial governments partner with DHS in its National Infrastructure Protection Plan (NIPP) to protect their critical infrastructure and key resources (CIKR). Also the private sector works in tandem with DHS under NIPP to ensure that cybersecurity and critical infrastructure protection is a well-rounded enterprise. These protection efforts extend to other federal government and private sector critical infrastructure and key resources (CIKRs) overseas.

The question then is can we say that America's cybersecurity and critical infrastructure protection strategy is robust enough given

the recent spate of hackings into the databases of some of the country's large corporations? It is apparent that the cybersecurity architecture of the affected corporations did not meet expectations. However, there is no cybersecurity defense mechanism out there that is 100% reliable, but corporations and individuals have to be proactive in their cybersecurity efforts. They have to monitor their networks constantly and ensure that every open or unlocked back door is locked. They can detect unlocked back doors by engaging friendly hackers. Friendly hackers will always expose loopholes in the cybersecurity architecture of an organization.

## Conclusion

The need for organizational cybersecurity strategies cannot be overemphasized. Companies should build solid information architecture that has the capabilities to withstand all forms of cyber-warfare. This can be achieved by hiring knowledgeable and certified information security personnel, conducting periodic risk assessment of information platforms, training employees on the risks of vulnerability and precautions against intended breaches. Tucker (2004) recommended the creation of architecture of technological high walls with hidden armed guards for information protection. There is also need for multilayered defense mechanism created around each country's information platform. Though this may not be enough but it goes a long way to help. It might be difficult to end cyber-warfare but doing nothing compounds the problems. Just as many countries are writing their military doctrines to center around cybersecurity, every business and country should develop information security strategies that will guide how they engage this serious global enemy.

The security policy has to be managed. It should not be a doctrine that is not implemented or evaluated periodically to ensure that the most defense against cyber-warfare is proactiveness. That is anticipating the inevitability of an attack and doing all necessary to deter it no matter when it comes.

## Synonyms

Cyber; Cybercrime; Cyber territory; Cyber war

## Definition

Cyberspace is the "globally interconnected digital information and communications infrastructure" (Nielsen 2012). It is comprised of globally connected networks of hardware, software, and data and also the people who interact with it.

## Introduction

The early designers of cyberspace focused on ease of access, interoperability, and innovation and gave less importance to security and accountability. While there is no doubt that cyberspace has made the world interconnected and made life easy, some of its key characteristics also make it vulnerable and prone to cyber threats and attacks.

Cyberspace has become extremely important in the recent times. It is now recognized as the fifth domain along with land, sea, air, and water. Governments all over the world are increasingly realizing the importance of cyberspace and its vulnerabilities and are taking proactive steps to secure it. Reducing the vulnerabilities and building resilience are two key components of crisis management in cyberspace.

## Key Characteristics of Cyberspace

Some key characteristics of cyberspace are (1) it is man-made and built to support particular purposes. When they developed the Internet, the designers focused on ease of access, availability, interoperability, expansibility, and innovation. For those early designers, security and accountability had low priorities. (2) It is dynamic – its structure can change in a very rapid fashion. (3) It is fast – events in cyberspace can occur rapidly. For example, the Slammer worm that attacked the Internet in January 2003 and infected more than 90% of vulnerable hosts in 10 min and caused significant disruptions to several institutions. (4) It is transboundary in nature. Most often it is not possible to territorialize it (Boin and Lodge 2016). (5) It has very low barriers to entry – even someone with a mobile phone or computer can access it from an Internet cafe. (6) It is growing rapidly – the number of Internet users is increasingly regularly all over the globe.

## Importance of Cyberspace

Cyberspace has gained considerable importance in the recent past. With the establishment of the 24th Air Force and the US Cyber Command, the US government now recognizes cyberspace as the fifth military domain along with land, sea, air, and space. The US government has also introduced many policy measures to deal with the growing cyber threats facing the country. In 2015, the Obama administration introduced several initiatives with the purpose of securing networks and trade secrets, protect privacy, and enable government agencies to share intelligence to manage cyber threats (Kshetri 2015). Most policy makers in the USA agree that stronger efforts need to be undertaken to better protect American interests in cyberspace against a wide array of dangerous threats.

Many governments in different parts of the world now consider their digital infrastructure to be an important national asset that needs to be protected. As Darby interestingly postulates it, cyberspace completely reduces the physical spaces between the enemies – the enemy now possibly does not reside on the "other side of the ocean" but only behind the firewall. The Russian cyberattacks on Estonia in 2007 and on Georgia in 2008 have been referred to as the Web War 1.

## Threats and Vulnerabilities in Cyberspace

There is disagreement among experts on the significance and consequences of threats in cyberspace. While some like Clarke and Knake (2010) consider cyber war to be the next threat to US national security, others like Thomas Rid (2013) argue that cyberspace is making the world more peaceful because sabotage and espionage in cyberspace do not lead to any physical harm. Rid argues that the perception that cyber war will lead to the doom of society is unrealistic as cyber war has never happened in the past or present. Rid contends that cyber war will not happen in the future.

Even if there has never been a full blown cyber war, it would be naïve to assume that the threats pertaining to cyberspace can be harmless. In 2009, Stuxnet, a cyber worm, destroyed a huge proportion of Iran's nuclear centrifuges by making them to spin out of control. This attack on Iran clearly showed that cyber warfare can have strong visible physical consequences.

Also, several events in the recent years draw attention to the fact that in future, some nation can use its cyber skills to attack the civilian infrastructure and military of another nation. The fact that everything in the USA is completely connected – from automated tellers to the Federal Reserve, Wall Street, and most hospital and business computer systems – makes unwanted intrusions into cyberspace a serious threat. Also, given the highly digital nature of the US infrastructure, a cyberattack on the US infrastructure can be more devastating to the entire nation than any kind of traditional warfare activity like bombings. In 2011, Leon Panetta, then CIA director, warned about the possibility of a "digital Pearl Harbor."

## Crisis Management

Crisis is defined as "the perception of an unpredictable event that threatens important expectancies of stakeholders and can seriously impact an organization's performance and generate negative outcomes" (Coombs 2007). A crisis is by definition a time of great tension and uncertainty. Most often crises are characterized by a high degree of threat, short time for decision, and the "fog of crisis" that confuses the crisis participants about what is happening (Cimbala 2016).

Crisis is different from complex emergencies. As they happen more regularly, emergencies provide operational agencies enough past experiences that can enable them to plan better for future events. In the context of crises, past events do not provide much guidance to the policy makers.

Crisis management refers to the processes by which an organization deals with a crisis before, during, and after it has occurred. These processes involve identifying, assessing, understanding, and coping with a crisis. Crisis management is a core government responsibility.

## Crisis Management in Cyberspace

Given the complex nature of cyberspace, crisis management can be challenging. Cyber warfare is different from traditional warfare in many ways. In the first place, it is challenging to combat cyber spies. Secondly, attribution is difficult. It is impossible to prove with certainty that the hacker was working for a foreign government. Even when the IP address of a computer used in a cyberattack can be traced to a particular country, it is not enough evidence to prove that the government of that country was involved.

Cyber espionage, unlike traditional espionage, is more difficult to detect. Additionally, as there are no physical clues, it is difficult to prove when a system was compromised (Pedersen 2013). The transboundary nature of cyberattacks increase the challenges public and private authorities face while dealing with urgent threats.

Given the complexity of cyberspace, two important components of crisis management in cyberspace are risk mitigation and building resilience.

### Risk Mitigation

An important part of crisis management in cyberspace is reducing and removing the vulnerabilities in the computer networks.

It takes less than a minute to compromise an unprotected computer connected to the Internet, and an infected computer connected to other unprotected computers can quickly pass that infection to other computers. Even computers not connected to the Internet can become a threat if they are unprotected by allowing unauthorized people to access information. A computer not connected to the Internet can also become infected through an infected USB or DVD.

The reality is that there is no forced entry in cyberspace (Libicki 2009). No one can get into cyberspace if there are no pathways produced by the system itself. Therefore, building security in such that there are no loopholes is important to avoid a cyberattack. This is more important than building a strong offensive system against an attack. Building security into the software as it is being built is an important risk mitigation measure. Building it in such a way that it continues to function well even under malicious attack can be very useful (McGraw 2013).

A potential threat in cyberspace that is often ignored is the internal threat, i.e., misuse by employees, whether unknowingly or deliberately.

Employees might knowingly create threats if they are disgruntled or dissatisfied by the system or agency (Caruson et al. 2012; Antikainen et al. 2015). Cyber threats are not only technical problems but also leadership, human resources, and employee education problems. Thus, human decision-making is also very important to cyber security.

Two kinds of employees can pose an insider threat – those who intentionally misuse systems and those who assist outsiders unknowingly. There is a need to create more awareness about what actions can create a threat in cyberspace. It is also important to translate the complex, technical language most often used into easy to understand language. Besides, employees and contractors need to be provided adequate knowledge and skills to identify potential social engineering, spear phishing, or watering hole attacks.

Thus, end-user education is very important to prevent breaches in cyberspace. It is also important to have a policy that describes how to deal with unknown media. Most governments still rely mainly on antivirus and firewall protection and ignore end-user education.

Another important mitigation measure is conducting security audit and penetration tests. During these test, ethical hackers try to breach into the system of the organization and report back so that one can take preemptive action.

### Building Resilience

Crisis management in cyberspace should also include preparing to continue operations and return to normal as quickly as possible when attacks are successful. For effective crisis management in the cyberspace, resilience is important.

Resilience has also been highlighted in the 2015 US Department of Defense Cyber Strategies and commonly highlighted by most technical experts. Building resilience involves developing plans and actions that will minimize damage, provide for continued operations, and facilitate return to full functionality as quickly as possible when cyberattacks are successful. For example, in the case of the US electric grid, resilience would involve the system being able to perform manually even if the system goes offline. Having plans and training personnel for manual operation of critical infrastructure is very important for building resilience of the system.

## Conclusion

In the current, interconnected digital world, when a major part of the world is dependent on cyberspace, it is imperative that adequate steps are taken to ensure that it can function properly and without any disruptions. For effective crises management in cyberspace, public and private authorities all over the world need to take proactive steps. Two essential components of crisis management in cyberspace are taking adequate risk mitigation measures and building resilience. By focusing on risk mitigation, crisis in cyberspace can be either prevented or its impact reduced. Resilience ensures that the system is able to continue even if an attack cannot be prevented and thereby reduces the loss of time and money.

# Cyber-tech Companies and Public Mind Control

Amir Forouharfar
Department of Public Administration, University of Sistan and Baluchestan, Zahedan, Iran

## Synonyms

Public mind check; Public mind direction; Public mind dominance; Public mind dominion; Public mind engineering; Public mind management; Public mind manipulation; Public mind nudge; Public mind sway

## Definition

Public mind control is applying mass instruments and techniques in order to nudge the collective mind of a target nation, community, or group of people toward the manipulators' desirable direction or objective.

## Introduction

While Carpignano et al. (1990) and the other mass media scholars in the 1990s and before were blaming television as having a corrupting and degenerating nature for the public mind, they were hardly assuming that the former unidirectional impacting and shaping the public mind will change to a more sophisticated interactive situation, where the cyber-media and companies could receive even the most hidden intentions and aspects of public mind and access an influential medium via the stupendous public data to make the public cyber-hegemony of our era. What do *Google*, *Yahoo*, *Bing*, and the same search engines and cyber-companies know about the undisclosed side of the public mind? Public mind is determining leverage in election, political legitimacy, cultural fads, etc. The popularity and frequency of keywords in search queries on the Internet and cyberspace could provide a precious data on the current, latent, and emerging public demands or obsessions. Once these data are accumulated, analyzed, and graphed based on different categories such as age, education, geography, sex, political tendencies, etc., they could collectively reflect the hidden mentality of the public mind. Public mind has twofolds, superficially the evident aspect that is usually reflected on the news and non-cyber-media and, deep down, the hidden aspect, which is far more significant than the former, since it is usually reflected on the cyberspaces without the fear of sociopolitical pressures. The trends could reflect tremendous information on how the public thinks and demands. The search volume of queries reveals the backbone of public frame of

mind and even a predictable turn of mind in the future. The accession to query volumes gives an unprecedented and menacing capability to the cyber-tech companies with respect to how they are going to use the data. In spite of plenty cyberspace-regulating laws for the privacy of public information, a few companies may resist against the ready *Big Data* which could be datamined to demonstrate the undiscovered aspects of the public mind's patterns and intricacies. In the case of public administration, the trends, patterns, and associations of the public data are constituting an emerging power which could be applied either by a democratic government for leveraging good governance or by a totalitarian government as a means of suppression. Therefore, undoubtedly it is an influential tool of nudging the public mind. Such a quality justifies its study in public administration discipline. On the other hand, predictive ability of the search trends has been studied and proved in different studies (Granell and Carlsson 2018). Search trends were studied as a means of forecasting economic indicators (Choi and Varian 2012) or for increasing the precision of social issues prediction via the search trends volume, e.g., the rate of suicide in the UK (Kristoufek et al. 2016), or for analyzing the relation between the search trends and the financial markets (Preis et al. 2013) which in this case led to the introduction of "early warning signs." In addition there is the possibility of the strategic usage of the search trends like "Google Trends Strategy" to figure out if it is a proper time to sell or buy – based on the rising or falling of specific keywords' search volumes on the *Google* in comparison to the volumes of the same keywords in the previous 3 weeks. Furthermore, there is causality between certain searched words on the Internet and the stock market (Perlin et al. 2017). Even – based on the Internet users' search queries – there is a correlation between a country's per capita gross domestic product (GDP) and the extent the Internet users were searching for information about the future (Preis et al. 2012). However, the search trends and their data have been studied mostly in the world of business, and they did not often been studied in the political or public mind contexts. Lack of researches in this matter does not reflect the non-use of such data in the sociopolitical and public life by those who have accession to accumulation, selection, emancipation, and analysis of these data. The public mind researchers of the cyberspace usually ask the following questions in their studies:

1. What do the cyber-companies do with the dark side of the public data?
2. Could the public data be used for forecasting voting results?
3. Could the public data be used for responding implicitly and tactfully to the emerging public demands?
4. Is there anything that the cyber-companies know that the governments are not wide-awake about?

Nevertheless, it could not be denied that accession to the dark side of the public mind may lead to the intensions of designing or manipulating them. What *Noam Chomsky* clarifies as the propaganda-making capability of corporations via their domination over our public life, the media, and even the environment (Chomsky and Barsamian 2001) could be also discussed with respect to the cyber-tech companies' dominance in shaping our public life. Cyber-tech companies are new institutions of power. By studying the entry, the reader gets familiar with the potential threat or opportunity of cyber-tech companies in the third millennium administration of state and public affairs.

## A Few Examples of Cyber Public Mind Control

Cyber-tech companies are potentially capable of nudging and controlling the public mind that could be a threat or an opportunity to the world governments. Public mind trends are one of the online indicators of the public mind either for a limited specific geographical zone or for a global arena. Familiar examples of public mind trends' indicators are *Google Trends*, *Google Insights for Search*, *Google's Keyword Planner*, *Google*

*Webmaster Tools*, *KW Finder*, *Bing Keyword Research*, *Wordstream*, *Keyword Tool*, *Ubersuggest*, etc. Besides, some online text corpora in different languages (e.g., *American National Corpus*, *Corpus of Contemporary American English* (COCA), *Bank of English*, *British National Corpus*, *Oxford English Corpus*, *Corpus Resource Database* (CoRD) as a few examples in English language) prepare powerful statistical tools for discovering the public mind in different aspects within different time frames. Furthermore, states have some governmental bodies (e.g., the *American Association for Public Opinion Research*) to discover public minds. These governmental bodies act the same as survey firms. The survey firms in their public mind probe projects could use the big and enormous amounts of digital data that people unwittingly or wittingly provide about themselves (O'Connell 2010). For example, *Pew Research Center*, a fact tank based in Washington, in its quest to probe the public mind on *Flint water crisis* (the contamination of the drinking water of Flint, Michigan, with lead, which was first started in 2014 and resulted in 2016's federal state of emergency), analyzed 18 months' worth of Google Search data with the intention of tracking public interest in the crisis. The Google Search data – in this case – were used as a tool for analyzing the attitudes of the public (Gramlich 2017). In 2018, approximately every second, Google processed over 40,000 search queries that work out to over 3.5 billion searches per day and 1.2 trillion searches annually (Internet Live Stats 2018). Therefore, it gives a competitive advantage among the search engines to *Google* to be aware of the public mind worldwide. One of the cyber-nudging techniques – a technique to push or nudge public mind toward a specific issue – is showing a public issue high on the ranks of listed issues on an Internet page. It was statistically verified that once a politician's name stands at the top of the Internet page, there is a more possibility that he/she receives more votes (Shultz 2015). This technique is a means of public mind control on a massive and stupendous scale unprecedented in public life history (ibid.). Additionally, there are numerous other techniques applied by some cyber-tech companies to manipulate public mind. Some of these techniques are echo chambers, search engine manipulation effect (SEME), voter buttons, fake news, and misinformation dissemination (Kulpati 2018). Modern political campaigning potentially could take advantage of the undisclosed data on the public mind. A familiar example is *Hillary Clinton's* 2016's presidential campaign usage of *The Groundwork* technology firm. It shows how political campaigns could take advantage of data analysts and digital data to shape their voter blocs (Pasick and Fernholz 2015). Moreover, accumulating digital information of billions of searches gives the accumulator a powerful basis to draw meaningful social patterns out of it (Stephens-Davidowitz 2012).

Another cyber public mind controlling technique is the *search engine manipulation effect* (SEME) which is an influential behavior effect technique originated from manipulating search results that divert the Internet users' preferences. One of the proved effects of SEME on the public mind is also shifting the public voting preferences from 20 up to 80 percent (Epstein 2015; Epstein and Robertson 2015).

Furthermore, the search engines have the capability of affecting national elections either directly by manipulating the results' ranking or indirectly by optimizing some results, known as *search engine optimization* (SEO). SEO is to use cyber techniques to put a website in top result lists after searching specific keywords on a search engine (Yalçın and Köse 2010). Such optimizations usually lack transparency (Epstein et al. 2017).

*Twitter* and *Facebook* are two giants in shaping the public mind. *Donald Trump's* frequent use of *Twitter* shows his belief in the effectiveness of this medium for shaping the public mind. *Twitter* could be used as a significant means of reaching and impressing a great number of future voters. It could help politicians to nudge the public mind into specific frames of interpretations, i.e., the politicians could lay a ground – e.g., by the means of *Twitter* – to induce specific interpretation in the public mind. This is a framing technique to affect the public mind. This is one of the reasons for the political superiority of Trump in shaping the public mind (Vlatković 2018).

On the other hand, there are some claims that *Facebook* has been used as a strategic advantage in the 2012 US presidential election (Shafi and Vultee 2016). It helped the political campaigns to disseminate their messages in no time.

Generally, the facilities and infrastructure that are provided by cyber-tech companies – e.g., Twitter and Facebook – could be used by the outsiders for meddling and interfering with the democratic process of selecting political candidates, e.g., the Russian cyber-campaign to influence the US 2016 presidential election (The New York Times 2018a). Sometimes, trending fake or biased news will be used as a lethal weapon of the intruders into the public mind, e.g., there is some evidence that *Instagram* is actively used by outsiders to influence the public mind (The New York Times 2018b). Therefore, it is not only the intentional capability of the cyber-companies in influencing, twisting, and shaping the public mind but also the potentiality of being used by the outsiders not only to control but also to affect the public mind. Hence, some scholars such as Rule (2013) have warned against the "destructive uses" of the Internet and search engines. The Internet could be used for orchestrating cyber-warfare or political repression against a specific public mentality or even to be used for public mind diversion.

Cyber-companies have access to substantially digital type of public data on the Internet which are called Big Data (i.e., extremely large data sets). Therefore, in affecting the public mind, they deal with public mind Big Data.

## Big Data and Public Mind Control

Public mind is not constituted by the summation of the individual minds but as Lichtman (2013) asserts, it is the source and presupposition of the individual minds, i.e., in dealing with this public phenomenon, it should be studied with *Holism* mentality, i.e., to see it as a whole since it is impossible to reduce it to any constituting entities or what *Reductionism* does, i.e., to reduce and simplify the issues – and hence we apply "public" for it. The search trends data once accumulated could be dealt as *Big Data* (Jahedi et al. 2016; Siewert 2013) since they make a stupendous quantity, and the characteristics of *Big Data* could be logically applied to it in its discussion. Volume, variety, velocity, veracity, and value are the key concepts of Big Data (De Mauro et al. 2015) and hence the Big Data of public searches on the Internet. Here, *volume* refers to the size of accumulated public searches data. *Variety* refers to different types of public searches data. *Velocity* refers to the speed of public searches data generation and processing. *Veracity* refers to the quality and trustworthiness of the public searches data, and *value* refers to the capability of cyber-tech companies in digitalization and conversion of public searches to quantities and numbers. The superiority of each cyber-aspect of public data would lead to different tendencies of the public mind; i.e., the analysis of the public mind could be done by considering the 5Vs (volume, variety, velocity, veracity, and value). These aspects could define the current and latent orientation of the public mind.

## Cyber-Companies' Potential Scenarios to Influence the Public via the 5Vs of Public Data (Volume, Variety, Velocity, Veracity, and Value)

Although these days social networks prepare the interactive communication of the public and "participatory web" (Veltri 2013), the cyber-companies could benefit from the 5Vs of public search trends data (e.g., through *data mining* techniques: the techniques for discovering unknown structures in large data sets). Here the entry broadly presents five frequent scenarios of nudging and affecting the public mind.

## First Scenario: Taking Advantage of Public Data Volume

Clone is a term that means an identical individual grown from a single somatic cell. Cloning is a method in biology, which refers to the process

of making a genetically identical copy (clone) of an organism or a cell. *Cloning technique* is referring to multiplying the volume of the public data by initial dissemination of fake or exaggerated data on one fake or genuine website and intentionally copying and pasting or quoting the fake or misinformation to affect the public mind according to the interests of the disseminators. This technique will be usually used either for publicizing or for propagating public issues. Studies prove that cloning of misinformation on cyber social media in recent years has had a great growth damaging societies and democratic institutions (Allcott et al. 2018). A recent example of *cloning technique*'s effects was the great number of US adults who were not only affected by large false information but also believed what they read on social media before the 2016 election (Guess et al. 2018; Allcott and Gentzkow 2017).

## Second Scenario: Taking Advantage of Public Data Variety

Public data variety deals with collected public data types either as structured, or unstructured, or none of them as semi-structured, and a mixed data, which in the two recent cases lead to the complexity of data (Demchenko et al. 2013). Cyber-tech companies would affect the public through *multi-sourcing technique*. This technique is intended for reaching what Kaisler et al. (2013) mention as the richness in presenting the data through using text, audio, images, video, etc. When the public face a trending issue in different formats of representation (e.g., text, audio, figures and images, films, etc.), they would usually believe in the significance and urgency of the case. These impacts will be usually acquired by *multi-sourcing technique*, i.e., by providing the public with multiple types of data from multiple data outlets. In contrary to classic media such as television or radios which could only transmit a single type of data (visual or audio), cyberspace prepares the possibility of availability of different formats of data (photo, film, text, audio, figures, etc.).

## Third Scenario: Taking Advantage of Public Data Velocity

Cyberspaces disseminate the news faster than any other media, and because of this super-velocity, they should be counted as one of the foremost and timely public mind shapers.

## Fourth Scenario: Taking Advantage of Public Data Veracity

The *cloaking technique* of affecting the public mind frequently uses cloaked websites. Cloaked websites are sites that are published by individuals or interest groups who conceal their authorship with the intention of disguising a hidden and clandestine political agenda (Daniels 2009). By this technique, the cyber-companies and networks either intentionally by themselves or indirectly without being aware would be used for twisting the public mind. It also affects public data veracity by turning them into disseminating outlets for fake news and misinformation. A familiar example of *cloaking technique* is writing biased reviews on review websites. For example, the *MarketWatch* reported that 25% of entries on *Yelp* are forged and false review disseminated by paid freelance writers to improve the online reputations of specific companies (Pardy 2013).

This technique has also been seen in cloaking social media pages in world-renowned social networks such as *Facebook*. For example, some cloaked *Facebook* pages were created to disseminate specific political propaganda and goals by cloaking a user profile and copying the identity of a political opponent with the intention of sparking hateful reactions (Farkas et al. 2018). Therefore, large-scale manipulation of public data veracity could affect public institutions' decision-makers.

## Fifth Scenario: Taking Advantage of Public Data Value

*Data mining technique* is usually used by the cyber-companies to diagnose specific hidden

**Cyber-tech Companies and Public Mind Control, Table 1** Cyber-companies' 5Vs potential scenarios for impacting the public mind

| Public data 5Vs | Impacts | Cyber-techniques | Public mind effects | |
|---|---|---|---|---|
| | | | Positive | Negative |
| Volume | Volume impact | Cloning technique | Publicizing | Propaganda |
| Variety | Variety impact | Multi-sourcing technique | Inclusiveness | Perplexity |
| Velocity | Velocity impact | Dissemination technique | Timeliness | Overreaction |
| Veracity | Veracity impact | Cloaking technique | - | Fake news and misinformation |
| Value | Value impact | Data mining technique | Measurability | Oversimplification |

Source: Author's own work

structures in the public data. The numerical values of the public data could be used for measuring specific aspects of the public mentality.

The summarization of the abovementioned techniques and their public mind effects are presented in Table 1.

## Conclusion

Without any hesitation, public Big Data analytics could be applied for better, quicker, and more efficient public policy making (Barbero et al. 2016). However, there is always a possibility of a systematic inclusion and exclusion of public data and their manipulation. Cyber-giants such as *Google*, *Facebook*, *Twitter*, etc. are not only informant of the current and emerging trends in the national public mind in the country that are based but also in the other nations' public mind.

Our world is getting near to a phenomenon, which could be called cyber-oligarchy, which brought about public mind monitoring, controlling, and altering. Now for the cyber-tech companies, public mind sits in a glass house. They could thoroughly investigate and if intend smash it, shape, or even reshape it and put at stake the legitimacy of the states and their governments or divert the electoral intentions of the public to whom or to what they wish. This is the cyber-hegemony of our time, which the entry broadly tried to shed light on it with the intention not to be neglected by the governments in the new public administration practices.

## Data-Driven Ethics Monitoring

Jonathan Rauh
East Carolina University, Greenville, NC, USA

### Synonyms

Compliance monitoring; Data analysis; Ethics; Process monitoring

### Introduction

There is a quote from Alan Ehrenhalt (1998, p. 11) that nicely summarizes the problem of data-driven ethics monitoring: "When government has the right people, and the right system, and the right intentions, many good things are possible. The trick is knowing which ones they are." Ethics is an application of generally accepted social norms (morals) in governing behavior – that is, they help one establish right action from wrong. This manuscript examines the attempt in the field of public administration to use data-driven monitoring for ethical compliance. The term ethical compliance is used intentionally because an organization's code of ethics and subsequently the standard against which individuals and the organization are judged as ethical or not are externally given. The application of the code and the understanding of the code may be endogenous to the organization (see Geuras and Garofalo 2002), but the code itself is not.

This manuscript takes the position that the field of public administration has done a poor job at using data to monitor ethics. That is distinct from saying that it has done a poor job of examining ethics. This is because monitoring assumes an active process (Stevenson 2014), whereas the work to date has focused on post hoc analysis of ethical failings (Rauh 2015, 2016a; Menzel 2005, 2015) or evaluations of ethical training (West and Berman 2015; Villoria et al. 2013). This manuscript lays out the case that the ability to use data to monitor ethical compliance in public organizations is lacking due to:

1. A decreased understanding of organizational mission given increased devolution
2. A lack of ethical understanding due to the increasing trend among managers to rationalize their behavior as opposed to confront it
3. A general inability to effectively diagnose ethical failings when they do occur because of the previously mentioned problems
4. The fact that the ability to capture the data necessary does not exist and would likely lead to a hostile work environment

Ethics monitoring, unlike other compliance monitoring, does not have clear targets. Budget monitoring (Grizzle and Pettijohn 2002) or monitoring local bond markets (Moldogaziev and Guzman 2015) have measurable variables and

A. Farazmand (ed.), *Global Encyclopedia of Public Administration, Public Policy, and Governance*,
https://doi.org/10.1007/978-3-030-66252-3

targets defining compliant behavior – specific investment actions, budgeting practices, and so on. This is not the case for ethics monitoring where compliance is determined by value judgments based on an externally given standard (Chandler 1983; Stewart 1986). Much discussion of ethics "monitoring" has trended toward post hoc analysis (autopsies of what went wrong) as opposed to active monitoring. In this way the usual discussion of ethics monitoring makes it akin to monitoring via administrative procedures (fire alarms) – see McCubbins and Schwartz 1984).

Over the past 70 years, public administration has undergone a number of fundamental shifts in its thought on ethics ultimately landing now at what Fox (2001) argues is a postmodern public administration ethics. As noted by Fox, though, what we have been left with is not an ethics of administration but administrators rationalizing their behavior through an ever-increasing set of moral arguments which they never fully hash out. In practical terms though, we likely do not want administrators to do the job of philosopher but to have a good sense of what they *should* do in a given situation.

What an administrator *should* do is a huge question and one that can and has filled volumes so I will not attempt to fully address it here. Rather I intend to show how agency heads and organizational leaders may use a number of strategies in their collection and analysis of data for determining whether the behavior of individuals and business units comports with the agencies' values, i.e., Rohr's (1989) low road ethics of compliance. When this manuscript discusses data-driven monitoring, it portends assessment processes to see how far behaviors deviate from a standard. In the case of monitoring ethical compliance, it involves understanding the organization's structure and processes, setting clear expectations for employees and ensuring they understand those expectations, and understanding how changes to the system could induce behavior which is either unethical (either out of ignorance, necessity, or intent). (Unethical behavior out of ignorance simply means an employee does not know what they are doing is unethical; necessity portends a case where the structures have changed to the point that an employee has no good options left for behaving ethically (other than quitting); and intent envisions a willful violation of ethical conduct while knowing better.) Note that this manuscript makes no specific recommendations or models to monitor ethical compliance – that is, too large of a task for the space available.

Understanding the concepts behind different types of measurement tools and their underlying concepts is fundamental to their proper use. As Rauh (2016a) pointed out in a critique of the State Integrity Investigation, the use of the wrong measurement tools leads to the wrong responses. He further pointed out that this was a particularly poignant problem for ethics since ethical failings tend to elicit a visceral reaction from the public. Note that although individual employees could likely benefit from a sound understanding of these measurement principles, the emphasis here is at the organizational level, i.e., how can the organization most effectively and efficiently collect, monitor, and analyze its data regarding organizational ethics.

Current research on administrative ethics has made great strides in assessing how bureaucrats make decisions based on a given framework (Burke 1986; Cooper 1991; Light 2015; Goss 1986; Lewis and Gilman 2012; Menzel 2005). Research on administrative ethics writ large has focused primarily on:

(a) The design of codes of ethics (Svara 2015; Chandler 1983; Cooper 1987; Menzel 1996).
(b) The function of ethics oversight bodies (Smith 2003; Svara 2014; Stewart 1985; Dilulio and Dilulio 1994).
(c) The outcomes of political control over ethics oversight bodies (Rauh 2015; Rosenson 2003, 2009; Mackenzie 2002; Tolchin and Tolchin 2001). Other works have focused on correlates of corruption or on how the public responds to scandal (Alt and Lassen 2008; Glaeser and Saks 2006).

We therefore know a great deal about the institutional connections of ethics and policy. However this focus largely ignores the role of the

public in the determination of ethicality and with good reason. As noted by Rauh (2015, 2016b), McDougle (2006), Rosenson (2003, 2009), and Bowman (1991), the public does not really pay much attention to ethics in the government until there is a scandal. Ethics policies therefore tend to be ad hoc responses to quell public outcry rather than a comprehensive examination of the public's true beliefs about how they want their politicians and administrators to behave (see, e.g., Mackenzie 2002).

This manuscript continues with a discussion of the current practices in ethics monitoring in public administration, a discussion of the four approaches mentioned above and concludes with some examples of their application.

## Organizational Ethics Monitoring

Discussions of monitoring ethical compliance are found in political science, sociology, philosophy, medical and financial fields, and even economics. Much of the work on ethics monitoring in public administration has dealt less with how ethics are monitored and more with whether or not employees understand ethical codes. There has been little in the way of ethics monitoring as an active process and more post hoc analysis of ethical failings. As evidence of this, the majority of works dealing with ethics oversight (not including discussions of the ASPA code) in *Public Administration Review* and the *Journal of Public Administration Research and Theory* addressed topics of:

- Ethics training and dealing with employees (Bowman and West 2009; O'Leary 2010; Newswander 2015)
- The political connections between ethics and administration (Rauh 2015; Vigoda-Gadot 2007; Cowell et al. 2014; Rosenson 2006)
- The need for moral administrators (O'Kelly and Dubnick 2006; Kane and Patapan 2006)
- Calls for a new debate on ethics in public administration (Stensota 2010)
- Addressed the need for organizational reform of ethics monitoring (Kerkhoff 2011; Raile 2013)

### The Need for Better Tools

The emphasis on post hoc assessments rather than active monitoring is arguably because it has been taken for granted that the human processes and relative process inertia (processes are sticky) in complex organizations make meaningful monitoring difficult. This was first pointed out by Gannon (1973, 1977) in his discussion of the use and misuse of employee questionnaires for monitoring organizational behavior. Rezaee et al. (2001) use surveys of employees as a means of ascertaining their understanding of ethical codes. Their results suggest a need for greater inclusion of key stakeholders and a need for clear processes of how codes are applied as opposed to simply appealing to codes as authoritative – see also (Fox 2001).

Smith (2003) and Lewis and Gilman (2012) note the instrumental nature of ethics codes, e.g., they are applied in a manner that is best for the organization. Svara (2015) reimagines the American Society of Public Administration code in a manner which provides a macro-ethic under which professionals may operate. At their heart though, these works assume a reliance on the code by employees but such reliance should not be assumed without a proper monitoring system vis-à-vis their behavior. Political realities go a long way in making this case. As noted by Smith (2003), Rauh (2015), and Rosenson (2003), elected officials, who establish and fund ethics monitoring bodies, are loathe to give up oversight authority to unelected bureaucrats. As a result monitoring bodies are often underfunded and lack effective investigatory capacity. This lack of capacity is viewed as one of the reasons why ethics investigations either target high-level officials against whom there is an "open and shut" case or low-level functionaries who lack the requisite financial capacity to mount a sound defense (see Smith 2003).

### The Need for Better Understanding

Geuras and Garofalo (2002) – applying deontology, teleology, and character ethics to problems faced by administrators – argue that rather than monitoring ethical compliance, ethics programs should seek to promote ethical individuals, e.g., the organization promotes ethical behavior

through the mission and the code rather than seeking to attract ethical individuals. Brady (2003) makes the case that there are many ethical orientations in public administration, and these are established via the promotion of commonly held values, shared goals, etc. In both of these cases though, ethical malfeasance is only recognized after it occurs. This does not mean ethics programs should not promote ethical behavior. Rather it argues for an approach more in line with Rohr (1989). Specifically, the *high road* ethics of promoting ethical behavior should be strived for, but cannot be achieved without monitoring, e.g., *low road* compliance.

Many manuscripts call for continued vigilance in public administration ethics and make note of a number of training programs. For example, West and Bowman (2014) describe the effects of ethics training in US cities and the duration of the effectiveness of the training. Bowman and Knox (2008) track the shifting attitudes toward integrity in public agencies and argue for a more robust ASPA code – something later envisioned by Svara (2014). Even my own work has considered ethical failings in the sense of when a violation occurs rather than monitoring to prevent the violation – it is common throughout the field to consider training programs and their effectiveness over time based on the change in number of violations; it is less common to provide means of monitoring for ethical compliance. As a field public administration has a tendency to assume that the capacity of a training program is endogenous to the structure of the organization (Smith 2003; Bowman and Knox 2008) and exogenously determined by the pedagogical approach or capacity of the organization providing the training (West and Berman 2015; Rauh 2015). Rarely discussed is how such programs will be monitored or which types of monitoring work best for which organization.

## Data-Driven Approaches to Ethics Monitoring

Although there is little work describing monitoring procedures in public administration, the intent of this section is to show what a data-driven process might look like and point out the complexities that must be considered in such a process. This manuscript borrows examples from the industrial and organizational engineering literature to accomplish this. Yin et al. (2014) and Sobhani-Tehrani and Khorasani (2009) describe a number of processes for ensuring reliability and safety in industrial processes, e.g., fault detection. The term "fault" in fault detection refers to the failure of a business unit, individual, sector, etc. to conform to the expectations – a term which is necessarily fluid since expectations shift both between and within organizations but which must be understood by management in order to identify faults. Fault detection can be thought of in terms of the classical "fire alarm" (McCubbins and Schwartz 1984). An observed event or variable is needed to detect faults, hopefully before it gets to the point of an ethical qualm. This may be a process that is not in keeping with ethical norms of the organization as much as it may be an individual who is behaving contrary to the organization's ethical code.

It may be tempting to think of monitoring ethical compliance as a problem of detecting and isolating faults be thought of a general nonlinear system. To this end, one may consider it in the form of a general nonlinear equation describing the processes in an organization:

$$y_k = b(x_k) + u_k$$

where $y_k$ is the organizational output variable measuring ethical compliance, $x_k$ is the organization state vector, $b$ is the output equation for the nominal model for the organization, $x_k$ is the organization state matrix, and $u_k$ represents noise. This is a simple enough equation but the capability to measure the values in the equation are problematic to say the least.

As described in greater details below, this is too simplistic an approach for proper monitoring. Under normal circumstances, a manager may only be concerned with a change in $y_k$ and counsel or reprimand an individual employee, alter the design of a particular business unit, and so on. Without an effective means of monitoring

their processes and their organizational design, these responses may amount to patching holes since they have not identified whether the problem was one bad employee, a bad process, or an interaction between process and organizational capacity that led employees to act in a particular manner. This sort reflective analysis is largely missing from discussions of administrative ethics and is instead reserved for the work of inspector generals or federal probes, e.g., the 2016 probe into the actions of Department of Education's Chief Information Officer over the agency's failure to properly monitor its cybersecurity procedures (https://oversight.house.gov/hearing/u-s-department-of-education-investigation-of-the-cio/).

## What Is Required for Effective Fault Diagnosis in Ethics Administration?

A number of items are required for effectively detecting a fault in ethical compliance. First is a sound understanding of the mission of the organization, the processes by which that mission will be accomplished and citizen's expectations around outcomes. Next, and of equal importance, is an understanding of the ethics and values espoused by the organization and an ability to give meaning to those ethics and values. This is not always an easy task. As Fox (2001) notes, much of administrative ethics has become a case of managers rationalizing away their behavior instead of confronting it vis-à-vis ethical expectations. Next is an understanding of what constitutes symptoms of failure and lastly what constitutes the unmeasurable aspects, e.g., noise, within the organization – this is not to say that these may not be important within the organization only that they are not immediately measurable.

### Missions, Processes, and Non-missions

Measures of missions and processes are often associated with the performance management literature, and to a large degree, this is a study about managing ethical performance, so it makes sense to draw on this literature. As noted by Moynihan et al. (2011), few public organizations have the good fortune of providing simple and straightforward services. They must work across organizational and in some cases national boundaries while still meeting the democratic values inherent in their constitutional mandate (Rohr (1989, p. 60) as well as the individual expectations of citizens in the localities they operate. Additionally, organizations are often called upon the addressed issues that are not central to their core missions and must divert resources to those non-mission areas – transparency and openness being some of these. Piotrowski and Rosenbloom (2002), Piotrowski and Van Ryzin (2007), and Rauh (2016b) examine organizational commitments to transparency and found that managers tend to hold focusing on transparency as low on their priority. Part of the argument is that managers simply do not have the capacity to address transparency issues and that meeting democratic-constitutional values such as openness place a burden of time and capacity on agencies, e.g., their primary concern was accomplishing their mission and meeting the benchmarks against which they were evaluated while transparency and openness tended to take a back seat.

Transparency or other concerns associated with ethicality may be low on the list of priorities for managers. Piotrowski and Van Ryzin (2007), Piotrowski and Rosenbloom (2002), and Rauh (2016b) all found that the issue was one of capacity rather than simply a desire to eschew responsibilities. This is an example of how something non-related to the ethics policy of the organization may nonetheless lead to an ethical failing. The organizations in the cases described by the above authors were not actively trying to hide anything; they simply lacked the capacity to fully address transparency requirements. Such limitations though can cause an organization to run afoul of Freedom of Information Act requirements and can also serve as a violation the ASPA Code of Ethics, point 3: *Promote democratic participation* – inform the public and encourage active engagement in governance. Be open, transparent, and responsive and respect and assist all persons in their dealings with public organizations.

There are things that an organization can control and things that it cannot. It cannot control how much the legislature allocates for its budget, and it cannot control the number of statutory requirements placed upon it. An organization's

leadership may advocate on behalf of the organization on these matters, but ultimately they are exogenously given. This may seem like an obvious point, but it is an important one considering how federal relationships have changed over time, with the federal government devolving much of its policymaking authority to states and thus placing increasing burdens of capacity on states to accomplish ever-expanding missions. Anyone who is concerned about ethics in administration or simply good governance should be concerned about this since it makes understanding missions monumentally more difficult (Milakovich and Gordon 2010; Conlan 2010; Oates 1972).

### Understanding Administrative Ethics

Administrative ethics have been conceptualized in a number of ways: foundational, deontological, character, and postmodern, to name a few. While philosophers debate over "what is good" and proper use of language, administrators need clear guidance on how to address ethical issues and the capacity to understand that guidance (Fox 2001). Unfortunately many schools of public administration began to push administrative law and ethics courses to the back burner beginning in the 1990s choosing to focus more on managerial skills (Raadschelders and Lee 2011; Menzel 2015).

The understanding of ethics goes beyond the current methods of ethics training. Menzel and Carson (1999) called for greater understanding across fields (psychology, business, education, and engineering) as well as a more in-depth methodological approach to studying ethics (see also Menzel 2005 and Menzel 2015). The findings from Menzel's (2015) review of studies on ethics in the public sector found a large body of fraud and corruption and developing the public sector ethos. The trend appears to be toward greater practitioner knowledge of addressing ethical failings or designing systems to promote ethicality, but little in the way of monitoring or checking for understanding. Ethical failings, as stated above, tend to be understood only after they have occurred and, as shown by O'Leary (2010), Bowman and West (2009), Kane and Patapan (2006), and multiple inspector general reports (see, e.g., https://www.oig.dhs.gov/index.php?option=com_content&view=article&id=222&Itemid=69), they are rarely single issue failures but result from breakdowns in organizational processes and either a willingness to violate (or a lack of understanding of) ethical expectations.

### Monitoring Beyond Our Capacity?

As mentioned above, a linear approach to monitoring is too simplistic to effectively monitor ethical compliance across an organization. To get a sense of what complete process monitoring for ethics would look like, imagine an organization with $N$ processes and $K$ employees. This can be envisioned as an $N \times K$ matrix with $K_i$ employee completing $N_i$ process. Now consider that there is at least one opportunity $Z$ for behaving in a way that is against the organization's ethical understanding. To monitor all employees across all processes, one would need to be able to monitor a three-dimensional $N \times K \times Z$ matrix. Additionally, $Z_{i,t+1}$ may be dependent upon the actions of $N_{i,t}$, $K_{i,t}$.

Just by way of example, to estimate the differences in possible values of $Z_i$ across $K_i$ in a single $N_i$ (ignoring the temporal component) means that one is measuring the $ZK$ divergence within a given $N$. Assuming a Gaussian distribution, it follows that:

$$ZK\left(f\middle\|g\right) = \sum_{i=1}^{n} \alpha_i \min_j \left( ZK\left(f_i\middle\|g_j\right) + \log \frac{\alpha_i}{\beta_j} \right)$$

where $f$ and $g$ are density functions relating to the point sets of $Z$ and $K$. If one thinks of the point sets as delta functions (logical since we are discussing change), then it is natural to think of any model as attempting to capture possible mixtures of the point set. The change in the parallel density functions across two dimensions would then be the issue of concern for one single process and one single group of employees. Parsing this out across all possible processes $N$ one can see that the monitoring capacity would quickly expand beyond the basic forms of monitoring in which administrators are trained. Additionally, this says nothing of how intrusive this monitoring may or may not be. This does not mean that there are not potential solutions to the monitoring problem or that there are no shortcuts within the $N \times K \times Z$ matrix, as shall be described below.

## More Efficient Means of Data-Driven Analysis?

If data-driven monitoring is to occur in public administration, then the field must embrace more rigorous methodological techniques as well as suggestions from relational theories within organizations. As seen in McGrath (1984), Illgen et al. (2005) the factors linking organizational inputs and organizational outputs is the behavior of employees within a given framework. These scholars identify factors such as trust, team cohesion, and shared cognition (see Carter and Mossholder 2015) as factors which serve as predictors for organizational outcomes. Measures of social interactions between individuals tend to resemble an amalgamation of individuals' perceptions rather than correlated behavioral matrices (Carter and Mossholder 2015; DellaPosta et al. 2015). This is a problem for ethics monitoring because, unless public organizations are going to move to big-data style monitoring of its employees (costs and morale issues notwithstanding), the type of data available typically available in public organizations does not lend itself well to the sort of relational monitoring described above. To this end, a recommendation for managers would be to establish of system of monitoring paying attention to the key features identified above: (1) detailed process knowledge, (2) regular checks for employee and managerial understanding of ethical expectations, and (3) an understanding of how the addition of responsibilities affects 1 and 2. If an organization's management has a firm grasp of these factors, then they should be able to monitor moves away from the equilibrium point (no unethical behavior) and address issues as they arise.

Because the aim of monitoring is to capture ethical issues before they become a problem, organizational processes do not follow a standard linear pattern (Allison 1971); targeted monitoring or risk-based monitoring offers the most efficacy for identification:

- *Targeted monitoring*: replacing traditional periodic inspections with data-triggered inspections. This approach more appropriately leverages resources by focusing on those areas of highest need.
- *Risk-based monitoring*: measures and analyzes risk to determine when an action is harmful. This approach, in conjunction with targeted monitoring, is particularly beneficial in focusing resources to those areas that need the most support.

Although engineering and the hard sciences are able to estimate the parameters of a process using expert knowledge (Cabral and Schurr 2010), or by estimating model fit predictions using process observations (Facon and David 2006), a combination of approaches is likely necessary when dealing with an organization where processes are beholden to human interactions – expert opinion and statistical reasoning. Long-term monitoring programs are normally conducted with the goal of estimating trends for individual units within an organization and organization-wide (Provan et al. 2005; Borgatti 2009). Because collection of such data occurs within specific business units in an organization, across multiple individuals in each unit and across multiple project types, they have the potential to be used for creating data sets and organizational maps showing changes in practices ethical attitudes, differences in levels of compliance in specific units and projects, and so on (Tsui and Liebowitz 2005; Barabasi 2016).

Like all observations though, monitoring data are imprecise. When the aim is to develop a profile of risk characteristics of ethical violations, the amount of information related to organizational processes driving any identified ethical challenges will require additional model calibration since the ethical violation (save a willfully corrupt individual) is cannot occur without the processes that are in place. A monitoring regime covering organization-wide characteristics but with large temporal lags may be adequate to follow organizational processes. However such data will fail to capture variation occurring at the business unit level.

In contrast with general purpose surveys across the organization, targeted monitoring samples those units where changes in ethical attitudes

or practices that are potentially corrupting are likely to occur, e.g., financial services, product approvals, regulatory preclearance, etc. By their nature, targeted monitoring programs theoretically contain more useful information for model design (Yin et al. 2014). They do not cover the entire organization though, and so one cannot be sure if all areas where ethical violations may occur are being covered.

Risk-based monitoring is generally used in collaboration with targeted monitoring and is when you are seeking to examine the risks represented by each targeted unit. One would conduct a risk-based assessment at the beginning of any monitoring program. An incident may occur in a unit, the organizational make-up may change, regulations may change, etc., all of which may trigger for risks of ethical noncompliance. There is nothing novel about this from a management perspective. The principles of risk mitigation are fairly standard across organizational segments even though different organizational segments have their own languages (FDA-UCM269919 2011; Artzner et al. 1999). At its core risk is about the likelihood of an occurrence, in this case the likelihood of observing behavior that is counter to the ethical understanding of an organization. It is imperative though to adjudicate decisions about the risk of an outcome based on information that is as complete as possible. The problem of incomplete or information, particularly in public organizations, has been known for some time but its effects are still not fully understood. Kelman and Friedman (2009) and Wegner et al. (2008) in an article on the potential for dysfunctional reactions to performance measurement targets found that altering performance measurement targets do not increase the likelihood of dysfunctional reactions or improvement of outcomes, respectively. On the other hand Rauh (2016a) found that increases in transparency requirements for managers did not lead the managers behaving more strategically in their requests for federal grant funds.

While the task of monitoring individuals conducting processes within business units within an organization is a daunting task, understanding organizational processes and potential risks thereto, and having a sound ethical understanding, should do much for determining the most efficient targets of any monitoring that occurs. It is imperative that expert knowledge be combined with any data collection and monitoring regimes that are put in place.

## Closing

In this manuscript, I have attempted to point out a number of requirements for monitoring ethical compliance in organizations: understanding the organization's processes, having a sound ethical understanding, and understanding how changes to the organization can open up potential for ethical hazards. I have also attempted to point out a number of weaknesses in the current study of ethics monitoring. Ethics monitoring is reactive instead of proactive, and so it is difficult to call it monitoring. In this regard better tools are needed to capture the likelihood of ethical violations both within and across organizations. Although I have not sought to describe any particular monitoring technique, I have offered two connected approaches to monitoring which rely on an organization's managers having a sound understanding of processes and a clear understanding of ethical expectations. Targeted monitoring targets resources at specific units which, due to prior knowledge about the organization or processes in general, are the most likely areas for ethical violations. Risk-based monitoring necessitates a study of the likelihood of an event occurring which would place the unit out of ethical compliance. For this reason, the methods used must be risk-based measures, e.g., most likely a maximum-likelihood approach. This was pointed out by Rauh (2016b) in his analysis of the State Integrity Investigation's findings.

Closing the literature does not currently point to strong abilities on the part of managers to use data to monitor ethics in public organizations. This is in part due to a limited understanding of an organization's mission and the corresponding processes. This is expected though given

increased devolution, an observed trend among managers to rationalize their behavior as opposed to confront it, and a general inability to effectively diagnose ethical failings when they do occur because the aforementioned issues. This should serve as a call to action to practitioners to move away from post hoc analysis of ethical failings and to actively monitor processes for the potential of ethical failings. Risk management standards are available which are sector specific and are already in place for process improvement. Monitoring for improved ethical outcomes should be no different.

# Data-Driven Management

Elizabeth Davies, Gary VanLandingham and Torey Silloway
Pew-MacArthur Results First Initiative, The Pew Charitable Trusts, Washington, DC, USA

## Synonyms

Evidence-based policymaking; Government performance; Outcome monitoring; Performance management; Performance measurement; Program evaluation; Program performance

## Definition

Data-driven management is the strategic, routine use of data to improve service quality and achieve key outcomes.

D

## Introduction

For years, leaders in both the private and public sectors have recognized the value of using data to guide operations, maximize productivity, and achieve important goals (see McAfee and Brynjolfsson 2012). *Data-driven management* is the strategic, routine use of data to improve service quality and achieve key outcomes. This approach is a best practice for optimizing government efficiency and effectiveness across agencies. When developing goals, data can help leaders identify needs, prioritize activities, and track the outcomes that matter most to their community. In the context of project and program management, data can help identify and diagnose problems as well as support implementation of successful practices. When used to inform spending decisions, data can help policymakers direct resources to their best use and shift money away from ventures that are not working.

This entry explores how data-driven management has evolved within the public sector and considers how government leaders can use data to set and report goals, improve program performance, and make funding decisions.

## The Evolution of Data in Government

Today, nearly every USA state, along with local and regional governments and federal agencies, collects and reports a wide range of data (NASBO 2015), typically including population demographics, service inputs (the resources such as funding and staffing used to deliver programs), outputs (the number and type of services delivered), and outcomes (the impacts of services for

clients and the community). Governments frequently collect these data from multiple sources, including administrative records, community surveys, regional benchmarking initiatives, and national datasets, and apply a variety of techniques to interpret results (the Consortium for Advanced Management – International (CAM-I) has identified over 50 techniques available to public and private sector organizations to improve performance; CAM-I 2015).

The ubiquity of data-driven management is a relatively new phenomenon. Early in the twentieth century, the management use of data in the USA was generally focused on employee efficiency and performance appraisal, often using the time-and-motion techniques pioneered by Fredrick Taylor. The use of data by the federal government increased through its responses to the Great Depression and World War II, which required managers to coordinate nationwide efforts. Data-driven management activities by states and local governments were slower to develop, but began to grow through the diffusion of analytical techniques, such as the Planning-Programming-Budgeting System adopted by the federal government, as well as initiatives to develop nationwide datasets including the Uniform Crime Reporting System and the Medicaid Management Information System, which collectively increased analytical capacity in the states (Mushkin 1977). Beginning in the 1960s, state legislatures and governors also began to institutionalize data analysis to support their growing responsibilities in policy development and oversight.

Government's increased capacity to engage in data-driven management, coupled with resource scarcity, began to change the role of policy analysis as well, from a source of descriptive information to a resource that could be used to engage in political bargaining (Radin 1997). The perception of data as a tool made it increasingly important to validate both the data and the methods used to arrive at key findings. Standards for data management emerged through national associations (such as the Government Finance Officers Association) and research groups (such as the Urban Institute), as well as through ongoing federal initiatives, including the federal Government Performance and Results Act (GPRA) of 1993 and its 2010 modernization, both of which placed a strong emphasis on data vetting and transparency, and the Program Assessment Rating Tool (PART), designed to help federal agencies assess and improve performance and outcomes through a standardized evaluation process.

## How Governments Use Data to Set and Report Goals

In recent years, public leaders have focused more attention on using data to assess needs, set goals, and monitor key outcomes rather than "counting widgets" that are produced from service delivery. Ideally, the process of needs assessment and goal setting occurs independently of current program offerings, funding streams, or legal mandates. In reality, leaders must determine which outcomes they want to achieve within the context of the current service delivery system; efforts to do otherwise, such as goal setting exercises that do not assume continuity of services, are typically short-lived.

This process often begins with a needs assessment that examines population demographics, service delivery levels in different geographic areas, and incidence of problems within a community (such as poor educational attainment, unemployment, and health risk factors); some efforts also include collecting citizen input from public forums and community surveys. When reviewing a needs assessment, leaders must interpret how this information translates to a particular goal or long-term outcome; for example, a needs assessment that detects an increase in neighborhood graffiti or citizen concerns about trash collection may suggest that the government should track and prioritize the appearance and quality of its public places.

Managers can also use data to establish outcome targets. National initiatives that present common metrics for multiple jurisdictions can help leaders identify outcomes that are frequently tracked by similar entities and establish a national

or regional baseline or benchmark against which to compare their own progress (e.g., see www.nationalcoreindicators.org). Such benchmarking data are helpful because they are often easy to collect, can be reported regularly, and provide a high-level, comparable indicator of quality of life. Managers can also use historical data to track and review trends – assuming data points are calculated consistently over time – to contextualize current outcome levels and set priorities based on whether factors are moving in a positive or negative direction. However, benchmarks and trends are limited in that they cannot tell leaders whether outcome levels, even if superior to other jurisdictions or to historical progress, reflect the current needs of their jurisdiction.

Documenting the link between outcomes and services can bring greater objectivity to this process of identifying and prioritizing outcomes. A program logic model or theory of change diagram illustrates how resources expended (inputs) are expected to generate services and products (outputs) that lead to desired results (outcomes). These exercises can help leaders and managers understand how their work contributes to larger governmental goals and to manage programs and funds more effectively. A logic model can be built from the top-down, starting with outcomes of interest to the government and then considering how a specific service contributes to the overall goal, or from the bottom-up, starting with a program and then considering why they are offered. The strongest logic models utilize data and rigorous research to document causal direct links between inputs, outputs, and outcomes and help leaders and managers understand and defend the effectiveness of programs by reducing the possibility that other factors have contributed to the result.

Most governments that track outcomes also report key performance data to agency and elected officials, funders, and the public through websites or documents; some also supplement this performance information with written analyses, financial data, supplemental information such as methodology descriptions, and links to agency performance dashboards (e.g., see http://vaperforms.virginia.gov/). In addition to enabling stakeholders to better understand what is being accomplished with tax dollars, these reports can be helpful to executive and legislative staff who are responsible for budget development and agency personnel whose work contributes to the reported outcomes.

## How Governments Use Data to Improve Program Performance

Ideally, data systems enable public managers to monitor program operations on an ongoing basis, comparing actual results to targets, responding to problems as they arise, and adapting strategy to optimize performance. Unfortunately, many outcomes desired by governments are difficult to measure (such as whether program staff throughout a state are following treatment protocols when serving substance abuse clients), are slow to change (such as air quality), or require monitoring for long time periods (such as whether preschool programs improve high school graduation rates). Consequently, governments often must rely on intermediate outcomes such as completion rates, levels of pollution emissions, and kindergarten readiness test scores when examining whether programs are operating as intended.

Tracking interim outcomes and outputs is particularly important for managing the delivery of evidence-based services, where programs have been shown to be effective only when implemented with fidelity to treatment protocols (which often require that services be delivered in specified ways at required dosage levels to certain target population groups). As a result, data-driven management systems often must track compliance with program design in addition to key outputs and outcomes. Fortunately, monitoring tools have been developed in many policy areas to support such oversight. For example, the Correctional Program Checklist and the Standardized Program Evaluation Protocol enable governments to compare their adult and juvenile justice programs (respectively) against known principles of effective interventions and can help managers identify

which activities should be tracked to increase the likelihood of reducing recidivism.

Setting program targets remains one of the more challenging aspects of data-driven management and a topic on which relatively limited academic research exists. Guidebooks typically advise managers to set targets slightly higher than the programs' historical achievements or at a comparator jurisdiction's performance level. While useful for grounding expectations, such comparisons often tell managers little about whether those achievement levels are realistic in their jurisdiction. Standards set by national associations can provide useful guidance, but may not be supported by scientific evidence. Findings from rigorous evaluations may provide the best option for target setting by enabling managers to determine whether, and the extent to which, similar programs have been able to achieve desired outcome levels in other jurisdictions. For example, if a meta-analysis of prenatal counseling programs finds that the programs were successful in reducing infant mortality by 50%, the finding can reasonably be used as a performance benchmark for a similar local program targeting the same population.

Once targets are established, data dashboards, report cards, and other standardized reports can allow managers to compare current performance against targets and facilitate ongoing program and quality improvement. Some governments have created automated, high-quality, and real-time reporting systems that provide a broad set of performance data to inform program management and decision-making. Developing such systems often requires considerable investments in informal technology infrastructure to transition from manual, disconnected systems to a paperless, centralized database. These technological improvements can save manager and staff time that otherwise would have been spent on data collection, interpretation, cleaning, organization, and synthesis. These systems can be particularly useful for programs that must manage populations on a daily basis to avoid bottlenecks or capacity problems, such as jails and clinics. Integrated data systems that collect information in real time from multiple agencies can help managers gain additional insights into problems, such as identifying clients and families that utilize a range of government services and who might be better suited for a wraparound approach (e.g., see Chapin Hall's analysis of administrative data from multiple service systems; Goerge et al. 2010). Governments that lack the capacity to create such technology systems may be required to use manual systems such as logbooks to track key processes.

Maps are an increasingly popular form of data display, particularly when precise geographic information is available (such as a specific address or census tract) to explore trends within a discrete area. Managers can also use geographic information systems (GIS) to compare the performance of programs across multiple service areas, to identify problems that may be obscured when viewed in the aggregate, and to locate at-risk neighborhoods or populations. City and county 311 systems – customer relationship management systems that collect nonemergency service requests, along with complaints and compliments – frequently collect real-time, geographic data and are a natural candidate for map-based displays.

In addition to creating forms and templates for data reporting, some governments have also established standardized review processes to bring together managers in an official forum for discussing performance problems. For example, several governments have adopted the Performance Stat model, a management strategy originally developed by the New York City Police Department. This approach relies on regularly scheduled, structured, data-driven meetings where leaders review performance indicators with their direct reports; the approach is applicable to both high-level executives meeting with department heads and to managers meeting with staff. The Performance Stat model is distinguished from other regular staff check-ins by the frequency and regularity with which meetings are held and the continued focus on the latest performance indicators.

Some governments have created standardized performance review systems that compare the productivity and effectiveness of similar staff. While less common, such systems can be effective

in detecting problems and improving results, such as identifying call center staff that take excessive lengths of time to answer phone calls and to provide requested information to callers. However, these systems can be unpopular with workers who feel that they are held to unrealistic standards or are not appropriately compensated for superior performance (as in pay-for-performance human resource initiatives). However, a continued focus on quality improvement, a clear link between inputs and outputs, and a desire to highlight successes as well as challenges may help encourage staff adoption.

## How Governments Use Data to Make Funding Decisions

Almost all states in the USA, along with many local governments, incorporate at least some performance data in their annual or biennial budgets (NASBO 2015), often as the result of legal mandates (Lu and Willoughby 2012) and/or through formal performance budgeting initiatives, such as budgeting for outcomes and zero-based budgeting, that create a structure to collect and report standardized performance metrics during the appropriations process.

In theory, including performance data in the budget enables policymakers to identify and direct resources toward effective interventions that help government achieve high-priority outcomes. In reality, while many governments report this information in their budget documents, many struggle to apply these data in appropriations decisions, often due to problems including lack of interagency comparability, difficulty attributing outcomes to programs, and differing views on whether funds should be increased or decreased in response to poor performance.

In order to effectively use data to guide funding decisions, leaders need consistent information about the programs operating in their jurisdiction. Too often, the only data collected uniformly across government focus on resource usage – revenues, expenditures, and staffing counts – and most enterprise resource planning (ERP) systems track this information by organizational unit, expenditure type, or funding source, not by individual program. The lack of intervention-level data makes it difficult for policymakers to isolate the effectiveness of individual programs and to identify similar services for coordination and/or elimination.

Many jurisdictions have addressed this problem by establishing an official definition of program, such as "a set of related activities or tasks intended to produce a desired result for constituents... broader than a line item or task, but more detailed than a department or entire function...[providing] a discrete service that leads to an identifiable result or benefit"(Kavanagh et al. 2011). Developing this shared understanding facilitates consistent categorization and information gathering to guide budget decision-making. A growing number of states and counties have created detailed, complete inventories of their programs that identify not only what agency funds these interventions but also what core outcomes each seek to achieve and what populations are served. This information can help leaders to better understand the relationship between spending and outcomes and to identify service gaps and duplication.

Many US states and local governments are also using research on program effectiveness – "what works" – to categorize their programs, distinguishing those interventions with a well-supported link to outcomes from those that lack rigorous evidence of effectiveness. These efforts are often based on the work of national research clearinghouses, which compile and assess evaluation studies to identify effective and promising programs across a range of policy areas. For example, states and counties that participate in the Pew-MacArthur Results First Initiative typically develop detailed inventories of their funded programs that categorize each intervention by its evidence of effectiveness.

Comparative benefit-cost analysis can help inform budgeting decisions by creating a common metric to compare the outcomes generated by alternative funding choices. For example, a program that reduces recidivism will also reduce the number of arrests, court proceedings, detainments, and programming associated with the prevented crime – each of which has an associated

cost. The avoided crime also carries societal benefits, such as reduced victimization, that can be monetized. Added together and considered over time, these costs can be used to calculate a ratio that shows how much money is returned to the state or locality for every dollar invested. Managers with access to this type of information can assess whether a particular program is likely to generate positive returns on taxpayer investment or assess which combination of programming is most likely to achieve positive outcomes with the best use of public dollars. This comparative approach was pioneered by the Washington State Institute for Public Policy, which routinely conducts meta-analyses of rigorous evaluations to quantify the effectiveness of evidence-based interventions, and it has developed a model that monetizes the costs and benefits of implementing those interventions in Washington. As of 2016, 28 jurisdictions participating in the Results First Initiative have used this model to examine programs in their jurisdictions and estimate the short- and long-term return on investment that they could achieve by targeting resources to evidence-based, cost-effective options.

Contracts with service providers offer another avenue to incorporate outcomes into funding decisions. While these contracts typically include sets of deliverables – such as the number of job seekers served, the construction of a new light rail, etc. – with an established time frame, some government agencies have also required providers to report on the longer-term impact of those services, such as the number of job seekers employed for 6 months after service or the number of times the light rail system must be repaired in the 6 months following construction. In these cases, the government response to violations of contract requirements varies. Some governments require a formal inquiry into why the provider has not performed and what changes are needed to achieve specified outcomes. Others tie contract renewal to the achievement of outcomes, with providers disqualified from future funding if they consistently fail to meet performance expectations. Social impact bonds are an emerging form of performance-based contracting; these arrangements allow private investors to supply working capital for governments to implement evidence-informed programs, which the government must repay if specified outcome targets are met, often with a predetermined return on investment. For further discussion on how governments can orient their funding structures toward outcomes, see Shelton (2015).

## The Future of Data-Driven Management

The need to sift through and interpret large volumes of information is part of modern life – and part of modern government. In the USA, leaders are increasingly using data to optimize government efficiency and effectiveness through three primary management activities. First, when setting and reporting goals, governments are using data to identify the outcomes that matter most to their community, understand how services contribute to those larger goals, and share results with the public. Second, when delivering programs, governments are using data to establish meaningful performance targets, identify problems and issue areas, and devise solutions that focus on technical assistance and support. Third, when making funding decisions, governments are using data to identify, and direct resources toward, effective interventions that help achieve high-priority outcomes.

As governments expand their reliance on data to inform management decisions, leaders who can cross bureaucratic boundaries in search of information will be able to set more meaningful goals and targets, monitor progress, and respond appropriately and effectively based on observed results. Indeed, the increased focus on outcomes in management decisions has prompted some governments to use academic literature and program evaluations as a data source. Historically, performance management has been seen as a separate process from program evaluation, which tests whether an intervention contributes directly and significantly to an observed outcome, typically by comparing conditions or behaviors before and after the intervention or by comparing the intervention against status quo or a control group. The thinking holds that performance data must be

nimble and current to guide operational decisions; evaluations, in contrast, are costly, focused, and time-consuming and cannot produce immediate and usable management information. Put simply, "performance-based" was not "evidence-based."

This distinction is beginning to blur, as public managers recognize that while the typical performance management system provides "an indication of [an] organization's performance... [it cannot establish] a causal relationship between interventions and program outcomes. That requires... scientifically-based research methods known as program evaluation" (Van der Veer 2012). In the field of program evaluation, researchers are beginning to construct lower-cost evaluations using existing data from administrative and performance management systems (e.g., 35 state budget offices report using performance data to conduct program evaluations; NASBO 2015). And in performance management, governments are using rigorous research to create defendable, causal links between programs and their outcomes, set service level expectations based on how they impact program effectiveness, and prioritize funding toward interventions that have been shown to work in other jurisdiction and that generate a positive return on investment.

# Debt Brake: The Swiss Experience

Roland Hofmann
School of Management and Law, Zurich University of Applied Sciences, Winterthur, Switzerland

## Synonyms

Budgetary discipline; Debt brake; Expenditure ceiling; Federal Government Switzerland; Fiscal rule; Public debt

## Definition

The terms debt brake or fiscal rule refer to constitutional provisions which, in the sense of a self-restraint, aim to oblige governments and parliaments to limit government budget deficits or to stabilize government debt. Such rules oblige to keep public revenues and expenditures in balance over an economic cycle and to compensate for any overruns in subsequent years. In Switzerland, such a debt brake was successfully introduced in 2001.

## Introduction: Budget Deficits and Rising Debt

The increasing indebtedness of sovereigns has been the subject of extensive public and academic debate for several years (Feld and Kirchgässner 2008; Guarini 2016; Biondi 2016; Rodríguez Bolívar 2016). Many countries are struggling with budget deficits and rising debt, with corresponding economic and political consequences. High debt levels can lead to lower economic growth rates. The high debt levels of some southern European countries nearly led to the collapse of the Euro (Salvi et al. 2020; Kirchgässner 2013). But even before the great financial crisis of 2008, many countries were experiencing financial difficulties (Waldmeier and Mäder 2015: 1–2; Sacchi and Salotti 2015). The debt situation, which was exacerbated during the financial crisis, could not be consolidated in the following years, which is why the measures to combat the economic impact of the pandemic from 2020 onward caused the debt level to shoot up to exorbitant heights.

This development has led to a lively debate on how countries can reduce or at least stabilize public debt. One prominent instrument to achieve this goal is the fiscal rule. In recent years, a broad body of scientific research has emerged describing the effects of fiscal rules on fiscal policy and economic outcomes (Salvi et al. 2020; FFA 2018; Lüchinger and Schaltegger 2013).

## Political-Economic Background and Theoretical Foundation

### Autonomy, Responsibility, and the Causes of Indebtedness

Federally structured countries, such as Switzerland, which have a pronounced autonomy of public tasks, decentralized tax sovereignty, and budgets at the different levels of government, also require a corresponding responsibility at every level. The transfer of tasks, competencies, and responsibilities to subnational territorial authorities in a federally structured government means that these political units must and can bear financial responsibility. Financial responsibility is an outflow of federal autonomy. Autonomy and self-responsibility are inextricably linked.

The autonomous fiscal decision can also include *borrowing* (Waldmeier and Mäder 2015: 3–5). Debt allows consumption or investment and its financing to be separated in time. Debt is neither good nor bad in this sense. They become problematic when debt becomes excessive. In the long term, debt cannot grow faster than the economic growth of a state. Sustainable fiscal behavior thus requires a stabilization of the debt ratio (debt in relation to economic performance).

Chronic, structural deficit is the main reason why a country builds up debt (Waldmeier and Mäder 2015: 6–9). In the case of the Swiss cantons, deficits were the cause of 65% of the debt increase between 1990 and 2004. In the case of the Swiss federal government, deficits and the reorganization of public companies and organizations (railroads, postal service, pension fund) accounted for as much as 82% of the debt increase in the same period. Based on the causes of debt briefly outlined here, one goal of a budget rule must be to primarily strive to balance the public budget and avoid chronic, structural deficits. In this way, the debt ratio can be stabilized.

### Impossibility of Insolvency and Continuation of State Activity

Financial crises due to rising debt cannot be ruled out by the nature of the state; the state's financial power is also ultimately limited. Perhaps it is precisely because of the nature and function of states that they are particularly vulnerable to crises. As a *lender of last resort*, the state often assumes the leadership role in crisis situations in order to cope with the challenges ahead, which means that there is a latent danger of overburdening itself, especially financially (but also, for example, in terms of leadership capacities). Even if a country has it in its own hands to remain capable of acting within its own revenue (increase taxes) and expenditure (decrease government spending) sovereignty, there is ultimately no unlimited financial ability of the public sector. In a free and democratic country, it is to be expected that citizens will conduct a cost-benefit analysis

and, in the worst case, leave the country and emigrate (voting by feet).

In any case, the state must continue a certain minimum level of administrative activities and public tasks. A complete cessation of its "operations" is not possible. The concept of the state's inability to file for bankruptcy arises from the interest in preserving the function of performing public tasks, which cannot be discontinued. The aim of insolvency proceedings is to terminate the existence of a legal entity and dissolve it. However, this cannot be the objective in the case of a public entity, which has to perform public functions. The liquidation of a state would not fulfill the purpose of releasing assets to satisfy creditors from these assets. A state is not first and foremost an asset holder, but primarily a duty bearer and a sovereign.

In conclusion, it can be stated that the public sector can undoubtedly fall into bankruptcy, even if only de facto, but that this cannot be solved by bankruptcy proceedings due to the interest in preserving core public functions. The potential risk of over-indebtedness of a country must be solved in another way.

## Fiscal Rules from a Political Economy Point of View

The over-indebtedness or insolvency of the public sector has considerable consequences. The burden of a default is borne not only by lenders, but also by all citizens, because many public goods and services can no longer be financed and must be largely discontinued and reduced to core activities. The purpose of budget rules is to *prevent* chronic structural deficits, stabilize the debt ratio, and thus ensure the solvency and functioning of the state in the long term. In this sense, budget rules have a *preventive* effect, while debt enforcement and bankruptcy regulations have a *curative* effect (Guarini 2016; Waldmeier and Mäder 2015: 2).

One main argument for the introduction of financial governance mechanisms (debt brakes, fiscal rules) is that in democratic political systems an *asymmetry* between revenue and expenditure responsibility can often be observed (Waldmeier and Mäder 2015: 6–9, 43): While an adjustment of the revenue structure (e.g., tax increase) has to overcome high democratic hurdles (e.g., constitutional amendment, qualified majorities in parliament, mandatory referenda), expenditure can often be determined by a simple parliamentary decision. This results in a tendency toward deficits and debt, which should be contained by means of fiscal rules to maintain healthy public budgets.

The anchor point for assessing fiscal rules is the *sustainability* of a fiscal policy. The stabilization of gross debt has become established and proven as an indicator for sustainability. To stabilize gross debt, a balanced budget is a prerequisite.

Fiscal rules prevent insolvency (Waldmeier and Mäder 2015: VII, 10–28). The purpose of a rule is to institutionalize solvency and thus ultimately to maintain the ability of the state to act in perpetuity. In the case of general fiscal policy, the requirement of long-term sustainability means that the debt ratio must not rise permanently. A budget that is sustainable in the long term must satisfy the requirement of a balanced account over the business cycle.

## The Structure of a Fiscal Rule

A fiscal rule is not an *objective*, but an *instrument* for pursuing economic and political goals. It can serve to avoid shifting additional financial burdens onto future generations or to preventively counter the risk of de facto public sector insolvency. Since the 1990s, there has been a marked increase in the number of countries and subnational federal authorities that manage their public budget through fiscal rules (Waldmeier and Mäder 2015: 1–2). Some of these rules have proven effective, others have not. Switzerland, as an example, has implemented fiscal rules at all federal levels.

The basic architecture of a fiscal rule comprises *four elements*: (1) a basic rule, (2) a steering rule, (3) a sanction rule, and possibly (4) a relaxation rule (Waldmeier and Mäder 2015: 10–35; Guarini 2016): The *basic rule* contains the financial objective that is to be achieved. This generic objective is operationalized and specified with the help of a quantitative measure. The *steering rule* serves as a trigger to initiate actions. A threshold value is defined under which conditions the basic rule is

judged as "not complied with." The *sanction rule* determines – after the steering rule has been triggered – the necessary actions, measures, and corrections that must be initiated and implemented to comply with the basic rule again. The *relaxation rule* (escape clause) specifies the conditions under which the fiscal rule is not to be complied with.

In simplified terms, a fiscal rule could be structured as follows (Waldmeier and Mäder 2015: 43–56; see also Guarini 2016):

*Basic rule:* What is the objective of the fiscal rule? It is about the long-term financing of the budget and the sustainable maintenance of the public sector's functions and tasks. In this context, balancing the public budget in the medium term is a suitable approach. Medium term means allowing for cyclical deviations and requiring the public budget to be balanced over the business cycle (e.g., over 5 years). To reduce the possibility of evasive actions (escape from the budget), the state is to be provided for a comprehensive consolidation of all its activities and entities (analogous to private corporations). Special financing, special funds, special accounting, etc., must be dispensed with. Extraordinary budgets (e.g., social security funds) must also be subject to the fiscal rule.

*Steering rule:* Over a period of several years, the public budget is balanced, and debt does not increase further. Which criterion or threshold (trigger) indicates that the path of financial sustainability has been abandoned? Should flow variables (e.g., the public budget) or stock variables (such as the debt-to-GDP ratio) serve as control variables? It is important to define a threshold value that indicates a clear deviation from cyclical deficits to structural imbalances (e.g., deficit of X % on average over a period of 5 years). If a public budget is above the defined threshold, the debt brake does not trigger any measures. If the steering rule is violated, measures to correct the structural imbalances automatically come into effect with the aim of returning to long-term sustainability. The redemption period must be linked to the legislative/office/election period of the government and the parliament so that the burden of action cannot be passed on to subsequent generations of politicians.

*Sanction rule:* Violation of the steering rule must be accompanied by the credible consequence of a sanction. Otherwise, the fiscal rule will have no effect. On the one hand, it is important that the sanction does not worsen the financial situation. Therefore, threats of fines are unsuitable. On the other hand, sanctions should set in motion an automatism that adjusts those fiscal parameters that can improve the financial sustainability of the public budget. Ultimately, then, it is a matter of a mix of mandatory expenditure and revenue adjustments. What immediate measures should be taken when the threshold has been exceeded? What corrections can be initiated automatically to ensure financing in the short term on the one hand and to avoid setting a precedent for long-term corrective measures on the other ("sacrifice symmetry," i.e., a balanced distribution of the burden between payers and users to prevent a reform blockade)? Should this be achieved through tax increases or benefit reductions? Empirically, expenditure reductions are in many cases more successful than revenue increases.

*Relaxation rule (escape clause):* By their very nature, relaxation provisions jeopardize the purpose of fiscal rules. They should therefore only be applied in cases of genuine exogenous emergencies and catastrophes (natural disasters, pandemics, war). The frivolous triggering of the relaxation rule must be prevented by appropriate measures (mandatory referendum in a popular vote, qualified parliamentary majority, decision by the highest court, or similar).

A promising fiscal rule consists of these four elements which, when coordinated, can guarantee the long-term sustainability of the public budget. First, it is essential to define a target value that is suitable for maintaining actual solvency. Second, threshold values must be defined above which corrective measures must take effect because long-term sustainability is being breached. Third, a sanction mechanism is needed so that compliance with the fiscal rule can be effectively enforced. Fourth, escape clauses can be provided for real emergencies.

What is ultimately relevant for the impact of a fiscal rule is its precise design, with broad constitutional support, a close link to sustainable fiscal

policy, and an easy monitoring and understanding (Caselli and Reynaud 2020). What matters is the enforceability and thus the fiscal impact of the rule. Fiscal policy evasion must be prevented as wide as possible (Waldmeier and Mäder 2015: 49–57; Burret and Feld 2018a, b). It is important that the fiscal rule is placed as high as possible in the legal hierarchy, ideally at the constitutional level, and that any amendment or non-application be subject to a mandatory referendum by a popular vote. This will give these provisions greater weight and make them less easy to ignore or amend. Transparency and control can also increase enforceability (through independent fiscal councils, through financial auditors, or through courts).

## The Swiss Debt Brake

### Need for Action

The Swiss Confederation has a federal structure consisting of the Confederation (first level), 26 cantons (second level), and around 2000 municipalities (third level). The cantons and the municipalities differ considerably in terms of size, political orientation, culture, or economic strength. The subnational entities enjoy a high degree of financial and fiscal autonomy, with corresponding self-responsibility. The federal government is responsible for about 1/3 of all government spending. All three levels of government exhibit extensive fiscal federalism and a high level of direct democracy (Burret and Feld 2018b; Salvi et al. 2020; Feld and Kirchgässner 2008).

Although this institutional framework was supposed to limit public debt, Switzerland's federal and many cantonal and municipal debts increased markedly in the 1990s, in part because of a severe recession (FFA 2018). From 1990 to 2005, gross debt increased markedly from about 40 billion francs to about 130 billion francs. The constitution did know an article since 1959 that budget deficits should be reduced. However, this provision produced little effect (FFA 2018; Salvi et al. 2020). The required debt reduction, though, remained a dead letter, a common phenomenon in politics: In principle, there was agreement, but as soon as it came to implementation and the individual political case, there were always reasons to deviate from a balanced budget.

The realization matured that the severe deficit and debt problem had to be solved (FFA 2018). With this fiscal experience of the 1990s, the willingness of the Federal Council (government) and the parliament grew to impose fiscal restrictions on the public budget via a concrete and effective fiscal rule. The new Swiss debt brake limits spending to the level of structural, i.e., cyclically adjusted, revenues. Expenditures may only be increased if their financing is secured by revenues, and tax cuts must be accompanied by corresponding expenditure reductions.

### The Swiss Debt Brake – Key Elements and How It Works

The debt brake at the federal government level was approved by referendum on December 2, 2001 and incorporated into the Constitution as Article 126, with 85% of the voting population approving the constitutional amendment. The details of the debt brake were specified by law in Articles 13 through 18 in the Federal Budget Act. As of 2003, the rule was applied (FFA 2018; Salvi et al. 2020).

Various cantons enacted fiscal rules much earlier (Waldmeier and Mäder 2015: VII; Burret and Feld 2018b). The canton of St. Gallen has known a kind of a debt brake since 1929, and since the 1990s, many cantons have also introduced fiscal rules. As mentioned above, the federal level has also known a debt brake since 1959, which, however, remained ineffective.

The Swiss Federal Constitution describes the following fiscal rule in Article 126 "Financial Management":

#### Art. 126 Financial Management

1. *The Confederation shall maintain its income and expenditure in balance over time.*
2. *The ceiling for total expenditure that is to be approved in the budget is based on the expected income after taking account of the economic situation.*
3. *Exceptional financial requirements may justify an appropriate increase in the ceiling in terms*

D

*of paragraph 2. The Federal Assembly shall decide on any increase in accordance with Article 159 paragraph 3 letter c.*

4. *If the total expenditure in the federal accounts exceeds the ceiling in terms of paragraphs 2 or 3, compensation for this additional expenditure must be made in subsequent years.*
5. *The details are regulated by law.*

The *goal and mandate* of the Swiss debt brake is to keep federal expenditures and revenues in balance in the long run (FFA 2018; Waldmeier and Mäder 2015: 37–57; Salvi et al. 2020). The Constitution and the law governing the details do not merely set a goal, but a clear mandate for action. The core of the debt brake stipulates that revenues multiplied by a cyclical factor determine the expenditure ceiling. The balance between revenues and expenditures must not be achieved annually, but on a permanent basis, i.e., over an economic cycle. In addition to expenditure surpluses, nevertheless, revenue surpluses must also be avoided. Taxes should not be levied unnecessarily.

Maximum expenditures are derived from revenues multiplied by the cyclical economic adjustment factor. The adjustment factor is intended to stabilize expenditures over the cycle and bring them into line with fluctuating revenues. The factor consists of the ratio of trend output and current output. If the factor is higher than one, then a budget deficit is allowed. On the other hand, if the factor is less than one, then a budget surplus is required. The Federal Tax Administration is responsible for estimating the revenues (FFA 2018; Salvi et al. 2020) (Fig. 1).

Estimation errors regarding revenues (taxes) can lead to deviations. Such deviations are recorded in an equalization account. Additional revenues are credited to it, reduced revenues are debited to it. However, only reduced revenues are to be balanced by expenditure savings in the ordinary budget over several years. The treatment of the equalization account is therefore asymmetric, which tends to lead to a reduction of debt (FFA 2018).

The debt brake also contains a sanction mechanism to provide an incentive not to allow deviations and to plan expenditures and revenues as precisely as possible. Differences between budgeted and actual results above a certain level must be compensated by reduced spending (Salvi et al. 2020).

However, there is no obligation to reduce the debt accumulated by 2001 when the rule was introduced (Waldmeier and Mäder 2015: 37–57). The Swiss rule is therefore precisely a "new debt brake." The question at which level Switzerland's debt should be stabilized is not answered by the constitution. There is also no specification as to how high the government ratio (share of government spending in relation to economic output) should be. Therefore, the balance can be achieved

**Debt Brake: The Swiss Experience, Fig. 1** Consistent path of expenditure and cyclically dependent receipts. (Source: Federal Finance Administration (FFA) (2018))

both by revenue increases (tax increases) and by expenditure reductions.

Though, the scope of the debt brake is not comprehensive (Waldmeier and Mäder 2015: 39–40; Salvi et al. 2020). The rule deliberately includes not only the regular but also the extraordinary federal budget to limit attempts to circumvent it. However, separate accounts of the Confederation (e.g., the infrastructure fund), the social security system, and independent administrative units (e.g., the Financial Market Authority) are not part of the federal accounts. These entities are not subject to the debt brake.

The Swiss debt brake also provides for a flexibilization of the basic rule in extraordinary situations (FFA 2018; Waldmeier and Mäder 2015: 37–57; Salvi et al. 2020). The extraordinary financial need must be qualitatively uncontrollable by the federal government (such as a severe recession, a natural disaster, warlike events) and quantitatively of a certain amount. Procedurally, both chambers of parliament must also decide on an exceptional situation with a two-thirds majority. While combating the consequences of the Covid-19 pandemic, for example, the parliament decided to waive the application of the basic rule and approve extraordinary expenditures.

## Does It Work? Empirical Findings

Based on the development of Switzerland's gross debt since the introduction of the debt brake, the picture is consistently positive (FFA 2018; Waldmeier and Mäder 2015: 56–57; Kirchgässner 2013). The awareness of the central value of sustainable federal finances is likely to be deeply anchored in the population, parliament, and government by now.

The goal of the Swiss debt brake is to stabilize debt. However, it tends to work toward *debt reduction*. Between 2003 and 2017, the federal debt was reduced by around 18,5 billion francs. This was due to structural surpluses. On the one hand, revenues were higher and, on the other, expenditures were lower than budgeted (FFA 2018) (Fig. 2).

From 1990 to 2005, gross debt increased markedly from around 40 billion francs to around 130 billion francs. As explained above, this development was the cause of the introduction of the debt brake. Thereafter, debt was stabilized and reduced to below 100 billion francs by 2019.

**Debt Brake: The Swiss Experience, Fig. 2** Debts of the Confederation 1990 to 2017. (Source: Federal Finance Administration (FFA) (2018))

The decline in debt from 2005 described here was not only notable in nominal terms, but even more pronounced in relation to economic development. From 1990 to 2019, Switzerland's gross domestic product increased by 96% from 370 to 727 billion francs (per capita by 55% from 55,000 francs to 85,000 francs). The debt-to-GDP ratio fell from a peak of around 26% to around 18% (Salvi et al. 2020).

Practical experience with the debt brake at the federal level has shown that countercyclical fiscal policy was strengthened (forced surpluses in the boom years 2006–2008), debt was reduced, and the interest burden was lowered. The investment ratio remained stable. Today, the debt brake is widely accepted by the population and politicians (FFA 2018). Though, the debt brake in its current form is not a solution for long-term structural fiscal challenges (e.g., demographic change, crowding-out effects in the federal budget due to the financing of old-age pensions, which today already comprise more than 20% of expenditures). A budget rule (debt brake) would also have to be applied to the social security funds to have its full effect on the entire national budget (FFA 2018).

From a scientific point of view, it is necessary to assess whether the debt brake was actually the *cause* of this development or whether it was not another, coincidental confounding factor, such as the sensitivity of the Swiss electorate to additional spending and higher taxes. In fact, the effect of the Swiss debt brake has been proven (Salvi et al. 2020; Chatagny 2015). The debt brake makes it impossible to deviate from a balanced budget in the long run. Because expenditures may not exceed revenues over an economic cycle, a disciplining top-down approach to budgeting is applied. The rule thus becomes a *spending cap*. Such spending limits are commonly considered the only effective fiscal policy rules. The introduction of the debt brake led to a substantial and persistent decline in the debt ratio in Switzerland. The growth rate of government spending fell markedly after the rule was introduced. It also made an important contribution to shifting from a procyclical to an appropriately cyclical fiscal policy. Overall, the success of the Swiss debt brake is not a temporary phenomenon.

## Conclusion

Switzerland's public finances are in good shape by international standards. This is due in large part to the stringent design of the debt brake and the political will to comply with the rules. In addition to the federal government, most cantons also implemented a debt brake (FFA 2018) For example, it has been shown that cantonal debt brakes also significantly reduce budget deficits, while direct democracy leads to significantly lower government debt (Feld and Kirchgässner 2008; Burret and Feld 2018b). Debt brakes also reinforce precise budgeting (Lüchinger and Schaltegger 2013). Effective fiscal rules at the cantonal level even strengthen municipal public finances (Burret and Feld 2018a). And apparently, in Switzerland, direct popular rights, such as fiscal referendums in which the population can directly express its fiscal policy preferences, strengthen the effect of debt brakes. This is true even for financially weak cantons (Kirchgässner 2013).

The success of the Swiss debt brake also has an impact beyond national borders (FFA 2018; Lüchinger and Schaltegger 2013). Germany introduced a debt brake in 2011 that is largely based on the Swiss model. Due to the sovereign debt crisis in Europe, most EU member states committed to introducing a debt brake at the constitutional level in the 2012 Fiscal Compact. Moreover, in an international context, debt brakes have a balancing effect on the business cycle (Sacchi and Salotti 2015).

However, the most important contribution of the Swiss debt brake should not be measured in numbers alone. Rather, the introduction of the debt brake has fundamentally changed the fiscal culture in Switzerland (Lukasiewicz and Adler 2017). As recently as the 1990s, policymakers tended to focus on the demand for public goods without looking at the available financial resources. Today, the administration, the government, the parliament, and the electorate are convinced that government spending and revenues must be in balance. This is astonishing, considering that self-restraint runs counter to the logical interests of politics and administration.

# Debt Capacity and Financial Sustainability in Central Government

Yuri Biondi
Cnrs – Labex ReFi (ESCP Europe), Paris, France

## Synonyms

Financial condition; Financial position; Financial situation; Fiscal policies; Monetary policies; Monetary base management; Public debt management; Public financial management; Sovereign credit worthiness

## Definition

Central government is deemed to be financially sustainable when it can pursue its ongoing public benefit missions while fulfilling its financial obligations when they are due in time and amount. This financial capacity depends on both tax revenues and public debt management.

In this context, governmental debt capacity consists in placing sovereign debt – for the sake of debt issuance and refinancing – with governmental entities, resident and foreign debt-holding investors, monetary financial institutions, and central banking. The latter two placements relate to the monetary base management. Financial markets may facilitate some of these transactions on sovereign debt.

Therefore, fiscal policies, welfare policies, and public debt management are linked, while governmental debt capacity constitutes an integral part of its financial sustainability.

## Introduction

During the last decades, governmental debt has increasingly become "the bogeyman" of fiscal policies. Policy advisors, policy-makers, and the *media* have increasingly stigmatized the level and growth of governmental debt, raising the question of its supervision, its limitation, and eventually its reduction, either in absolute terms or relative to the size of the national economy.

This view on governmental debt assumes its analogy with debt owed by an individual to another individual. As Macaulay (1848, p. 400) explained, "here it is sufficient to say that the prophets of evil were under a [...] delusion. They erroneously imagined that there was an exact analogy between the case of an individual who is in debt to another individual and the case of a society which is in debt to a part of itself; and this analogy led them into endless mistakes about the effect of the system of funding." This view neglects the dynamic and collective dimensions of public debt management, misunderstanding the economic effects of its financial process of borrowing. On the one hand, governmental debt relates to the use of borrowing to fulfill public benefit missions with an overall redistributive purpose (welfare policies). On the other hand, it relates to the monetary base management (monetary policies).

This entry aims to address public debt management in its relation with welfare policies and monetary policies. The following section defines debt capacity and financial sustainability of central government in this specific context. The next section deals with their connection with the monetary base management. The last section reconsiders the bogeyman view on the basis of our institutional economic analysis. A summary of the main argument and its implications concludes.

## Defining Debt Capacity and Financial Sustainability

In a first approximation, the question of governmental debt capacity points to the willingness of lenders to lend to a government which issues debt (for sake of simplicity, we mainly neglect the assurance of non-debt liabilities such as guarantees and pensions). In turn, this willingness is related both to lenders' uses of this debt and to the capacity of a government (borrower) to sustain it over time. Therefore, governmental debt capacity is further related to the financial sustainability of a government, that is, its capacity (and willingness) to fulfill its financial obligations when they are due in time and amount.

From this perspective, a government can be considered as a socioeconomic entity that borrows from some stakeholders (the lenders). This financial process of borrowing is embedded in its economic organization, requiring representation and control through accounting systems that are generally established to perform both functions. These systems provide a standardized picture on the ways in which borrowed funds are acquired, spent, and eventually refunded by the governmental entity. This picture is generally common knowledge among citizenship, sovereign debt holders, and supervisory bodies, enabling them to elaborate informed opinions on ongoing public debt management. In this way, accounting systems drive representations that make the governmental entity controllable (accountable), framing and shaping its economic and financial processes over time and circumstances.

Accounting systems are often regulated through standards issued by private and public bodies; these standards are based upon and provide accounting models of reference for management, governance, and regulation purposes. These models are then constitutive of the institutional economic order in economy and society. The design of accounting models for whichever entity – commercial enterprises, public administrations, and financial institutions – makes the entity's economic and financial activity, with limitations, intelligible and manageable; in turn, the entity's activity is eventually responsible for social welfare (Biondi 2016b). The entity's accounting model is then expected to make it accountable for its contribution to satisfying individual and collective needs, as well as for sources

and uses of (financial) funds employed to intently pursuing that contribution.

Financial sustainability must be considered according to the specific contribution that is expected from each kind of entity. National accounting conventions attribute transfers and nonmarket provision of goods and services to public administrations, although production, transfer, and consumption acts are performed in every entity. This convention points to the contribution that frames and shapes entity's activities: production and profit-making, for commercial enterprises; and redistribution of incomes and fortunes, through transfers or nonmarket provisions, for public administrations.

This redistributive purpose frames and shapes its working mode of functioning and then the specific financial process generated by the public administration over time. As GASB (2013, p. 13) concludes in its white paper on the matter,

> governments are fundamentally different from business enterprises. As a result, separate accounting and financial reporting standards for governments are essential to meet the specific needs of the users of governmental financial reports. The standards for governments need to reflect their unique environment, including different organizational purposes and special legal powers, and to effectively address public accountability issues inherent to governments.

The overall purpose of public administration consists of direct satisfaction of individual and collective needs (according to its institutional scope), while no commercial revenue or business income is required to be generated throughout its working process. The nature of its public service activity is "nonmarket": it is performed by redistribution through transfers and provision of goods and services, either in kind or on non-commercial basis.

In this context, citizens are stakeholders who contribute with resources to the public administration (generally by monetary transfers) in view to perform activities with a non-market, redistributive purpose. Citizens' contributions are employed to cover expenditures for both expenses and financing the ongoing process, which requires a specific accounting representation. Accordingly, the government consummates resources acquired through taxation and borrowing, so as to redistribute them at the macroeconomic level. In turn, citizens contribute with resources to be redistributed by paying taxation and subscribing governmental debt issuance and refinancing.

Financial sustainability for central government is then framed and shaped by this specific use of governmental debt for non-market, redistributive purpose. Accordingly, under an accrual basis of financial accounting, accrued deficit or surplus (resulting from a balance between expenses and contributions attached to the same period and its accumulation over time) acquires a distinctive meaning that is different from accrued business income: be it positive or negative, this matching balance shows ongoing capacity of contributions (mainly taxation, in case of governments) to cover incurred expenses (Biondi 2012).

Generally speaking, accrual-based (accumulated) balance is materially negative and has increased over time for central governments all around the world. This fact has surely been the case throughout the twentieth century, showing that modern states employ debt issuance (and refinancing) to cover for operational expenses. Accordingly, governmental borrowing performs a specific economic function as a macroeconomic redistributive policy: in a nutshell, governments employ debt to redistribute incomes and fortunes across stakeholders over space and time (Biondi 2016b).

This specific debt use for redistributive purpose is made possible by continued refinancing of debt positions over time. When one cohort of debt securities becomes due, a new debt issuance is performed to replace the expiring one. In this way, the governmental entity can sustain a virtually permanent negative balance, as long as lenders go on subscribing its refinancing issuances over time and circumstances.

## The Connection Between Governmental Debt and the Monetary Base

This specific way to financial sustainability is further reinforced by involving governmental

debt into the monetary base management. The monetary base consists of currency (legal tender) and other cash equivalents that are transferrable, redeemable on demand and at par. They constitute the basis for the means of payment within the economy and are considered to be the most readily available for settling transactions and commerce.

Although we have been going on labeling it "debt," governmental borrowing has a distinctive meaning which is linked, on the one hand, to macroeconomic policies with, as explained above, an overall purpose and function of redistributing incomes and fortunes and, on the other hand, to the organization of the monetary base and its joint management by treasuries, central banking, and financial institutions.

In this context, governmental borrowing is systematically employed to both "wake up" sleeping cash hoardings and to manage the monetary base. On the one hand, governmental borrowing generates additional spending by mobilizing hoarded financial resources held by households and other final investors. On the other hand, placement of governmental debt in portfolios managed by financial institutions relates to monetary base creation and administration (McLeay et al. 2014a, b).

It is generally accepted that central banking assures liquidity of governmental debt (Buiter 2006). Open-market operations and refinancing policies operated through central banking do monetize governmental debt (Beard and McMillin 1986; Mishkin 2009), at least temporarily. Singh and Stella (2012) include into "money-like assets" both central bank deposits (reserves) and every collateral that can be converted into central bank deposits without haircut, such as governmental debt securities. Moreover, whenever central banks do create ex nihilo paper money (legal tender), they generally buy back governmental debt securities against this creation. Accounting consolidation of central banks within central government accounts clears all doubts concerning sterilization of governmental debt held by the central bank itself, for both interest charges and capital repayments (for the UK case, see Biondi 2016a).

Governmental debt refinancing involves a sort of public-private partnership between government and banking to manage the monetary base. This partnership has historically assumed various forms. Constitutional political choices are then involved in granting some debt securities with the privilege to be refinanced through central banking. For instance, shifting this privilege from governmental securities to private securities will shift control on the purchasing power from the public sphere of government to the private sphere of those security issuers, while reducing overall refinancing size may deleverage the economy, with effects on both spheres.

In sum, governmental borrowing deals with lending by households and other final investors and with monetary base creation and administration. From a macroeconomic perspective, governmental borrowing enables a "soft" redistribution of financial fortunes, which complements "hard" redistribution accomplished through taxation over incomes and fortunes. Among others, this redistribution may play an important societal function in compensating inequality in allocation of income and wealth achieved in other spheres of economy and society (Dabla-Norris et al. 2015). From the viewpoint of individual holders, governmental debt is to be remunerated by interest charges and repaid by capital installments at its nominal value; however, at the aggregate level, governmental borrowing enables transferring these borrowed funds *in view to redistribute them* across stakeholders. This mechanism is made possible by continued refinancing of governmental debt at every capital installments, which makes this debt, once again, an essentially monetary phenomenon.

## "Financialization" of Public Debt and "The Bogeyman"

This governmental funding practice, together with overarching institutions for treasury management and central banking, did not change radically in recent times (Singh and Stella 2012; IMF 2014; McLeay et al. 2014a, b; Biondi 2016b). However,

recent reform claims do apparently neglect this specific economic organization, looking for sustainability of governmental borrowing in terms of net assets (net worth) as accounted for by governmental financial accounts on an accrual basis. In particular, this balance sheet approach is the accounting model of reference for the International Public Sector Accounting Standards (IPSAS).

As a matter of fact, governmental debt capacity mainly relies, on the one hand, on the capacity to collect future taxation and, on the other hand, on issuance and refinancing conditions granted by national and nowadays also by international financial systems, which enable governmental borrowing. Within the latter circuits, one should further distinguish borrowing from governmental entities, intervention by central banking and monetary financial institutions, and lending by households and other final investors.

Governmental borrowing is ultimately justified by its specific function of "soft redistribution" that is accomplished through its refinancing. However, this function has never prevented modern states to be funded and refinanced for centuries by final investors active on Securities Exchanges. This long-standing investment practice has been accepting that structural debt is issued and refinanced over time to cover governmental expenditure, including for investment purpose. Net assets on accrual basis are then expected to be materially negative and even decreasing over time.

However, recent reform claims argue against issuance of structural debt. They claim for the strictest golden rule on governmental spending coverage. On accrual basis of financial accounting, this rule implies that net assets must remain around zero or become positive. Negative net assets should be admitted only temporarily, as it would be the case for a business enterprise.

These claims concern the very definition of financial sustainability, which involves the funding modes of public administration and its accounting representation on accrual basis. They can be linked to the ongoing "financialization" movement: a complex cultural and socioeconomic phenomenon driving the financial sphere at the core of coordination and control in economy and society (Biondi 2013). Concerning accounting and finances of public administration, this phenomenon has apparently facilitated imitation and transplantation of financial and accounting practices originated by the private sector, fostering the alleged analogy between governmental debt and other securities issued by business enterprises and financial institutions. This view often assumes competition between all and every security on one global financial market, neglecting then the privileged connection between sovereign debt and the monetary base.

Along with the rise of "financialization" since the 1970s or so, governmental debt has increasingly become "the bogeyman" of fiscal policies. Policy advisors, policy-makers, and the *media* have increasingly stigmatized the level and growth of governmental debt, raising the question of its supervision, its limitation, and eventually its reduction, either in absolute terms or relative to the size of the national economy. At the same time, the overall debt outstanding in national economies has been generally expanded, including by debts owed by households and financial institutions.

## Conclusions

Governmental accounting policies involve constitutional political choices between alternative modes of functioning for public administration, since accounting frames and shapes representation and control of public action over economy and society. Governmental financial sustainability and related funding modes ultimately depend on these constitutional choices.

Governmental debt capacity is then rooted in the specific context of public administration, namely, in its redistributive purpose and in the organization of the monetary base.

Concerning the redistributive purpose, the redistributive capacity of public administration is at stake when representation of financial sustainability is to be chosen. Ruling over public finances

should then consider the overarching definition of financial sustainability that each ruling establishes and implements.

Concerning the organization of the monetary base, limiting the issuance of governmental debt raises financial and societal issues related to the "financialization" movement. If this limitation does not reduce overall debt outstanding, every pressure on governmental debt reduction shall result in shifting purchasing power coordination and control from the public to the private sphere of society, reinforcing the centrality of banking and finance in coordinating and controlling economy and society. If it does, governmental debt reduction shall result in deleveraging the overall economy, reducing liquidity of its financial system.

Generally speaking, if governments can use relatively less debt to 'softly' redistribute wealth, compensation of inequality in incomes and fortunes shall be performed through alternative ways. In conclusion, defining governmental debt capacity and its control involves constitutional choices on power distribution in our institutional economic order, not only technicalities about fulfillment of governmental financial obligations over time and circumstances.

Governmental borrowing does not, of course, create legal tender money and still less does it create real goods and services. It is employed to fund transfers and non-market provision of goods and services. It does, therefore, something – it is perhaps easier to see this in the case of expansion of monetary base to finance public expenditure – which, in its economic effects, may lead to the creation of real goods and services that could not have been created without this practice. Social welfare improvement is then not synonymous of absolute or relative reduction of governmental debt.

## Synonyms

Debt financing; Local debt

Financing lumpy capital projects requires a large amount of capital up front, whereas the benefits and the revenue are spread over many years. For such projects, local governments borrow from investors such as banks, capital market funds, and other institutions (Lee et al. 2012). Debt becomes one of the primary revenue sources to finance the infrastructure projects of a municipality. One of the main advantages of using local debt is to increase the intergenerational equity because both current and future taxpayers pay for new highways, for instance, and also benefit from increased transportation coverage. If financing capital projects mostly relies on the current revenue (pay-as-you-go financing method), then current taxpayers would bear the fiscal burden but would share the benefits of infrastructure with future taxpayers. Long-term planning in fiscal operations is feasible through local debt because local managers are able to plan for the future and utilize resources to their full advantage; it also has a positive effect on improving short-term liquidity through the adjustment of the period between taking in revenue and making expenditures. Lastly, local debt encourages the central government to achieve its policy goals through medium-term or long-term government financing, and by serving the function of supplementing the administration's fiscal policy (Mikesell 2013).

This chapter is partly drawn from Chung and Kim (2019).

On the other hand, the utilization of local debt may also have several shortcomings. Local debt can impede the financial health of local governments with the accrued interest and other debt issuance expenses that it entails, such as up-front charges for financial advisory, debt service reserves, bond counsel, and so on. It can also have an impact on increasing the budget of local governments in the following year, which may affect upcoming budgetary concerns and obligations and result in the loss of flexibility in future operating budgets. Finally, the excessive use of local debt can pass on an excessive repayment burden to future generations. To balance benefits and pitfalls of local debt, a growing body of research has documented the role of governments in debt management and municipal bond markets. However, there are relatively few studies focusing on debt management in non-Western countries. Thus, this chapter aims to provide an overview of debt management and the municipal bond market in Korea. Then, it discusses relevant studies on local debt in Korea and concludes with a policy recommendation for these areas.

## History of Local Debt Policy in Korea

The most commonly understood meaning of local debt is debt that is taken on by a local government and paid over multiple fiscal years to the institution, taking on the form of long-term loans (e.g., certificates). In most European countries, local governments secure debt capital through borrowing from banks or financing institutions (Lee et al. 2012). Another mechanism of debt financing is the issuance of bonds, which are commonly referred to as municipal bonds in the USA. According to the *Local Public Finance Act* in Korea, local debt is defined as debt that is taken on by local governments to cover either deficits or finance capital-project construction, and can be financed through either long-term loans or municipal bonds that take the form of securities.

The growth of subnational public debt has contributed to pervasive policy issues for the central government in Korea. Without an effective regulatory framework, subnational borrowing results in

exposure to substantial fiscal issues, such as fiscal stress and debt crises, which threatens the quality of local service delivery and the overall economic stability of a region. In a sense, the Korean government emphasizes the series of policies to control and sets the limit on subnational government borrowing. Regulatory frameworks for subnational debt can be categorized into two parts, such as *ex-ante* control and *ex-post* insolvency mechanisms. The Korean government focuses on *ex-ante* borrowing regulation. For instance, a local government should go through the approval process from the central government in order to finance local debt.

However, a number of scholars contend that the subnational debt policy should not lie in simply prohibiting subnational borrowing only to resolve the subnational insolvency problems because there are substantial benefits of subnational debt (Liu and Waibel 2008). As such, the Korean government introduced the debt ceiling system through amendments in *the Local Government Act*, *the Local Finance Act*, and *the Enforcement Decrees to the Local Finance Act* in 2006, in an effort to revitalize the use of local debt. Its underlying premise is that local governments issue fewer local debt under the approval-by-project system from the central government. In order to stimulate the local debt market, the central government needs to offer more leeway for local governments in choosing to participate in the debt financing market. The main feature of legislation is to set the total amount of local debt, and thus localities can issue any debt within the limit. To this end, a specific process that can be utilized to achieve these goals is as follows: first, local governments are divided into four types on the basis of their financial indicators, such as debt service ratios and debt-to-budget ratios (See Table 1), and then the ratio of issuable total municipal bonds to total revenue sources is granted depending on the four types of local governments (See Table 2). For example, if a local government's debt service ratio is below 7% and its debt-to-budget ratio is below 15%, then it is designated as a Type 1 institution. Larger localities within a Type 1 institution are able to use local debt up to 8% of total revenue.

The ceiling system was amended in 2013 to abolish the categorization by debt level, and set initial ceiling amounts by judging the financial situation of local governments on the basis of the local debt self-issuance ability index and managed debt repayment cost ratio, instead of the debt-to-budget ratios. The legislation also differentiates the possible local debt issuance ratio on the basis of each type of local government, such as special metropolitan areas, provinces, cities, counties, and districts. In addition, the use of urban railway public bonds and regional development public bonds were not included within the scope of the ceiling system, and a separate issuance ceiling was set. Table 3 describes the new total debt ceiling system.

In short, the ceiling system, which was newly amended in 2013, differentiates the ceiling

amount on the basis of the type and financial situation of the local government when it assigns the ceilings to what is utilized by local governments. This system aims to increase the autonomy of local governments in handling local debt.

Descriptive statistics partially support that localities with more independence have been likely to use debt over the last few decades. As of the end of 2016, local debt totaled 26.4 trillion won, of which 22.53 trillion won existed in metropolitan cities and provinces and 3.88 trillion won in local bonds. When local debt balances are divided into the issuance of securities and local loans according to the method of local debt financing, the amount of local loans is 5.97 trillion won (22%), and the securities issuance is 20.47 trillion won (78%). This result is a sharp change over the last few decades, considering that the issuance of securities amounted to 2.84 trillion, which is 15.1% of the total local debt financing in 2000 (See Fig. 1).

## Relevant Studies on Local Debt in Korea

The existing line of studies related to local debt in Korea can be categorized into three types (Kim and Yoon 2009). Early studies were concerned with the determinants of local debt issuance. Pai (2005) examined how the enactment of the local governance system in 1996 as a natural experiment subsequently affected the use of local debt. Using data from 1988 to 2003 in subnational debt, he empirically found that the size and ratio of the local debt decreased after the implementation of the local governance system. In addition, local governments with a large ratio of central government subsidies were shown to have much lower local debt utilization ratios as a result of utilizing this system. It can be implied that since the implementation of the local governance system, local governments are more likely to secure their finances by relying on central government subsidies rather than by issuing local debts. In a similar vein, Pai (2009) also examined

the relationship between the use of central government-dependent financing and the issuance of local debts. The results showed that there was a negative effect between these two variables. Namely, it revealed that the dependence effect was much greater for locally allocated tax grants compared to other government subsidies. In a recent study, Lim and Hong (2012) also explored factors related to the balance of issued local debt, such as population size, size of subsidies, and financial independence levels, and found a positive relationship among these variables. At odds with other studies, Kang (2014) focused on total debt, which included the debt of local governments as well as the debt from local government-run enterprises and the implementation of private-sector investment projects. In that study, he analyzed the effect of socioeconomic, financial, and political factors and found that socioeconomic factors, such as the demand for local economic development and welfare, the existing state of competition, dependent financing factors, and the constituent's political support had a significant influence on the issuance of debt by local governments.

Second, several studies emphasized the local debt issuance system such as the bond issuance law and the local bond ceiling system. For example, Ra and Cho (2008a) examined whether the local bond issuance ceiling system achieved the intended policy effects. The authors pointed out that while the autonomy of local governments in issuing local debt was expanded, the issuance of local debt and its market had not been revitalized as anticipated. The results showed that the bond issuance law was partially in operation due to a lack of long-term low-interest funds, and that the ceiling standards that were presented in the local bond ceiling system were considerably low. In a subsequent study, Ra and Cho (2008b) also looked for ways to improve the local bond ceiling system for the benefit of the municipality. The authors argued that the private capital market needs to play a larger role in subnational finance for the continued revitalization of the local bond market. In doing so, the local government should look for ways to reduce the cost of raising capital, adjust the BIS capital adequacy ratio, and expand the range of local debt. Additionally, they pointed out that credit rating systems should be introduced to cultivate a stable investment environment. In this sense, Lee (2010) compared the local debt issuance systems of Korea and Japan. He pointed out that local governments in Korea have less autonomy over debt issuance compared to Japan. In addition, he argued that local governments issue relatively small local debt in response to the financial demands of the local governments in Korea. In the meantime, Kang (2015) examined the effects of the introduction of the local debt ceiling system in 2006 on the issuance size of local debt. The author empirically studied its effects by examining the period from 2000 to 2004 before its implementation, and from 2008 to 2011 after its implementation. The results showed that there were no statistically significant differences in the amount of local debt issuance before and after the implementation of the local bond ceiling system. This finding revealed that among the various factors related to the issuance of local debt, the levels of fiscal autonomy, development project costs, and debt repayment amounts have a significant impact.

Third, several studies also discussed local debt management practices or the introduction of credit ratings. Kim (2005), for instance, argued that with the securing of local debt issuance autonomy by individual local governments, there is a need for the introduction of credit rating schemes used by credit rating agencies. The author further asserted that a performance evaluation, more comprehensive monitoring of local governments, more efficient allocation of resources, and resolving the information asymmetry issue can all be achieved through the introduction of such a credit rating system.

## Conclusion

The balance between revitalizing local bond markets and regulating the municipal debt market has been one of the salient policy issues in local public

finance. The subnational debt markets in Korea remain small and the larger portion of local debts relies on borrowing from the central government rather than through the private capital bond market. The total limit system for local debt was introduced in this context and was useful in the management of debt by a municipality. However, it still remains to be seen how the ceiling system can be used as an advantage to stimulate municipal bond markets.

## Definitions

| | |
|---|---|
| Debureaucratization | A complex set of reforms in the public sector, bringing changes especially to the ownership and management of public enterprises. |
| Power | The source of electrical energy used for socio-economic development. |

## Introduction

Electricity is a major source of power, a critical infrastructure that is strategic to a nation's socio-economic development. Therefore, this provides a rationale for most government involvement in its ownership or management. In Nigeria, the Federal Government (FG) merged Electricity Company of Nigeria (ECN) and Niger Dams Authority (both were established to distribute and generate power respectively before independence in 1960) to establish National Electric Power Authority (NEPA) with the task of producing and distributing electricity (Tinuoye 2017).

However, NEPA's inability to live to its responsibility of meeting customers' (household and

commercial) electricity demands sparked criticism from stakeholders. Ajumogobia and Okeke (2015) identified various challenges to the delivery of quality service such as: inadequate power generation, low connection rate, inefficient usage of capacity, limited access to infrastructure, insufficient transmission, and distribution facilities, among others. Meanwhile, many of the public service reform commissions set up by FG to review public service efficiency suggested the following options: merger, downsizing, privatization, or commercialization of public enterprises. Thus, debureaucratization, an omnibus concept, depicting incremental changes to fast-changing post-industrial society in public administration occasioned by an ideological shift from monistic to pluralism perspectives or closed to open systems, and technological progress (Argyriades 2010), of the power sector was considered a veritable option, specifically, privatization.

It becomes imperative that government had to opt for NEPA privatization, especially after its initial commercialization in 1989 made negligible impact on effective and efficient service delivery to its increasing customers. Hence, the Power Sector Reform Bill (PSRB) was initiated and signed into law in 2005 under President Obasanjo's administration. This was done with the intent of ending NEPA's monopolistic operation and providing a legal framework for the reform in a non-competitive market, in order to ensure efficient and effective power sector Consequently, the bill enabled participation of the private sector in the generation, transmission, and distribution of electricity while floating the Power Holding Company of Nigeria (PHCN) as successor to NEPA with provision for its unbundling into eleven distribution companies (DISCOs), six generating companies (GENCOs), and one transmission company (TCN), and establishing National Electricity Regulatory Commission (NERC) as the sector's overseer alongside Nigerian Bulk Electricity Trading Plc (NBET) serving as bulk buyer/intermediary between the GENCOs and DISCOs (Enoche et al. 2015).

Therefore, this entry's central objective is to offer insights into the structural composition of the Nigeria's power sector reform; examine the reform's theoretical underpinning; and descriptively analyze the post-reform experience upon which the current position of the sector's reform is anchored.

## Underpinning Theory

Privatization is a concept that has metamorphosed to acquiring a theoretical status currently due to its increasing popularity, acceptance, and application by many countries as a public sector reform instrument. This begins from the 1970s after the United Kingdom (UK) and United States of America (USA) adopted, and championed its global promotion. Privatization theory is pivoted on liberal economy tenets, notably, a total disengagement of the public interest for active involvement of private firms in a country's production and service industries, and government active facilitator's role in the economic management. This emphasizes the promotion of effective and efficient service and productivity if employed by a state predicated on a liberalized operating environment (Muogbo 2013).

The anticipated improved performance of the public enterprise via privatization informed its choice for Nigeria's electricity sector's reform, and the altruistic and faithful implementation of the reform implies that the lackluster performance of NEPA would become history. However, by and large, the essence of privatization policy as a prime among other tools of New Public Management (NPM) in Nigeria has not yielded the desirable results (Ibietan 2019). While the post-privatization performance of the power sector is a subject of debate among scholars, stakeholders, and operators, the submission seems to reflect the picture of its current position, especially based on a cross-country performance comparison. The next section highlights the structure and features of the power sector reform in Nigeria.

## Structure and Features of the Power Sector Reform in Nigeria

The unbundling of NEPA's into 18 units characterized by 11 DISCOs and 6 GENCOs with the

TCN operating under a management contract agreement, "described as one of the boldest initiatives globally" (Tinuoye 2017, p. 2). The distribution companies are Abuja, Benin, Ikeja, Eko, Ibadan, Enugu, Jos, Kano, Portharcourt, Kaduna, and Yola, while the generating companies consist of Egbin, Kainji/jebba, Shiroro, Sapele, Geregu, and Afam, and the TCN was initially managed by Manitoba Hydro International (MHI) but was reverted to the government in 2016 after the expiration of the contract without stating any clear-cut basis. Moreover, it is important to note that a DISCO covers an average of three states within the country, except Eko and Ikeja, that operate within Lagos State with extension to adjoining cities in the neighboring Ogun State. Of the six GENCOs, only Kainji/Jeibba and Shiroro are hydro-power stations but others generate electricity through gas thermal technology with Egbin having the highest installed capacity of 1320 MW (Tinuoye 2017).

Furthermore, the size of the country largely accounted for the adoption of a horizontal unpacking separating the DISCOs and GENCOs into the regional operational bases, differing markedly from what is obtainable in other African countries. As such, the structural and institutional designs are tailored to meeting the vast space and high population features of Nigeria. Also, to increase power supply, the PSRB provides for government's establishment of National Integrated Power Projects (NIPP), and Independent Power Producers (IPP), owned and managed by the private power generating firms to complement the GENCOs' capacity (Okafor et al. 2015). In this sense, aside from increasing the generation capacity, the participation of the IPPs is also a strong indication of the existence of a liberalization regime affording competition in the sector, to some extent.

It is also interesting to note that though the overarching objective of the power sector privatization is to achieve maximum efficiency in the sector's value chain, the measure equally generated revenue for the government. This was coordinated by the National Council on Privatization (NCP) that warehoused the privatization exercise, while the Bureau for Public Enterprises (BPE) discharged administrative duties. However, since 2013 that the private companies took charge of the DISCOs and GENCOs operations, and noting that government retains 40% and 20% ownership shares, respectively, service delivery is still low and continue to ebb, with complains and criticism being unleashed on both the government and power sector operators, most especially, the DISCOs interfacing with the electricity end-users. This calls for urgent and more robust actions or strategy for effective reform outcomes.

## The Post-reform Experience

The power sector is naturally interdependent and runs on the network of a tripod, namely: generation, transmission, and distribution. This systemic operation makes disruption at a point to interrupt the effectiveness of the other binary. In other words, an increase in the power generation without a commensurate capacity for wheeling would not only make the energy wasted (because it cannot be conserved), but also deprive the distribution end of electricity for the customers. Therefore, it is difficult to isolate the consequential effects of the challenges at any of the treble value chain from one another.

Although, the entrance of the private investors in the generation and distribution ends have raised the sense of responsibility to customers, unlike the pre-reform era characterized by negligence of duty and other bureau pathologies that exacerbated poor service delivery, there are ticklish and unabating issues highlighted in this issue and proactive measures canvassed to redress the palpable state of affairs through a more effective power sector reform.

## Operators' Capacity

It is noteworthy that the power sector is capital intensive. However, the reform is yet to provide lasting solutions to the challenges of the huge cost of generation, weak transmission, and efficient distribution according to Enoche et al. (2015).

Implicitly, the new operators are yet to manifestly display financial adequacy, managerial and technical capabilities required to optimize the facilities bequeathed to them for improved service delivery. Additionally, the "legacy debt" (debt of the government Ministries, Department, and Agencies (MDAs)) to DISCOs worsen their illiquidity, making the DISCOs to continually clamor for government's funding support despite the Central Bank of Nigeria (CBN) intervention fund received in 2016. The criticism by civil society organization on government subsidy to private firms, and government's justification of its action as necessary to stabilize the sector, are quite illuminating here, even as NERC threatens to cancel eight DISCOs licenses due to 30.1 billion debts to NBET (Simon 2019), are poignant evidences of the shortcomings of the power sector reform.

A related study shows that customers' assessment of some DISCOs using the electricity supply, load shedding, pricing/metering, response to customers, and coverage area indices affirms gross underperformance (Idowu et al. 2019). Hence, it is instructive that a collaborative synergy of resources and efforts between the government and new managers of the sector to recalibrate the processes leading to enhanced performance is urgently required.

Similarly, the current level of technical losses to electricity generation via differences between the installed and generation capacity; loss to distance in the course of power transmission; and theft by customers at the distribution end demand a review to minimize its adverse effects on the network. Furthermore, the national grid system appears to be a burden on the efficiency drive of the value chain. Tinuoye (2017, p. 4) posits that in Nigeria, 90% of electricity output is supplied through the national grid. The negative consequences of this on the national life can be colossal in the event of grid collapse or hitches. Thus, alternative grid methods such as mini-grid or off-grid system are imperative to, first, minimize chances of national power outage and, second, entrench some degree of stability in the power network.

## Regulatory Environment

The regulatory environment is a crucial and irreducible requirement for the operation of electricity business, more importantly in a liberalized regime. NERC is empowered by ESPRA to regulate the sector operators, protect customers, mediate between the DISCOs and customers, and between operators, and ensure fairness to all stakeholders. Nonetheless, with the prevalence of estimated billing system inflating the cost of energy consumed by customers to the advantage of the DISCOs, and recorded cases of energy pilfering, bypassing of meters, and similar indecent practices by customers, the business environment can be said to be poorly regulated. To inject sanity into the sector, NERC needs to improve its supervisory role and be more proactive in attending to stakeholders concerns, more importantly by making customers' access to prepaid meters and ensuring that punishment for infractions are strong to act as deterrent to real and potential offenders.

## Political Considerations

The conflict between the national and individual or sectional interests is an albatross to transparency, credibility, and sanctity of both the pre- and post-privatization process and management, respectively. This is typified by overbearing influence of political considerations in the decision making before the unpacking of the electricity sector and post-reform regimes, observed and lampooned by the civil society groups, interest groups, and some of the citizens. For instance, the liberal precept of market determination of electricity price in the post-privatization era is restrained because the government regulate retail price, making the tariff to be lower than the economic reality. Consequently, the non-economic reflective price is characterized by poor return on investment for the private operators, specifically, the DISCOs.

As a corollary, political considerations and graft tendencies of political leaders and

bureaucrats account for the non-transparency of the bidding and award processes of DISCOs and GENCOs, manipulations of rules and disregard for extant laws, prevalence of inexperienced operators in the power sector, and Bureau of Public Enterprises' (BPE) permission to defer payments and manipulation of payment terms, contravening the bidding rules to the disadvantage of co-bidders (Socio-Economic Right and Accountability Project (SERAP) 2017) are emblematic of the reform process. In light of this, it is discernible that the pre-reform trajectory largely accounts for the current weak position, and contributes (to some extent) to the post-privatization poor regulatory environment.

## Conclusion

This entry highlights the debureaucratization of the power sector in Nigeria. The failure of NEPA as a public enterprise to effectively provide quality power supply to the residential and commercial customers not only attracted criticism but impacted negatively the nation's social and economic development. Thus, privatization of the power sector value chain was considered as panacea to epileptic electricity supply. This step led to the private ownership and management of the 6 GENCOs and 11 DISCOs in 2015 while TCN operates under a management contract until 2016 when it expired making the FG to regain its management. This was accomplished with the aid of the PSRB act that provides the legal framework, the establishment of NERC as the sector's regulator, and NIPP and IPP to complement the generation capacity of the GENCOs. It is noted that while the reform raised the current operators' sense of responsibility, the systemic failure of the value chain circumscribed optimum performance.

Moreover, the post-reform analyses reveal the sector's inadequacies, jeopardizing effective, and efficient network functioning. The GENCOs and DISCOs' financial, technical, and management incapacity as private entities conjoin to adversely affect stable electricity experience by customers. And, the GENCOs, TCN, and DISCOs inability to minimize their technical losses further aggravates their technical deficit, while the inability of NERC in curbing the prevalence of estimated billing system with the provision of pre-paid meters, and bringing to the barest minimum the unwholesome behaviors of consumers, compounded the operators' challenges, presenting the regulatory environment as uncertain and deprived stakeholders' of confidence. Also, undue politicization in the pre- and post-privatization regimes resulted in the emergence of inexperienced bidders and unsound management decisions, respectively. The culmination of these deficiencies is poor service delivery by the network operators manifesting in the current poor quality power supply to consumers.

[3]Department of Psychology, University of Ghana, Legon, Accra, Ghana

### Synonyms

Citizens' participation; Decentralized agencies; Ghana; Institutional trust and transparency; Local governance

### Definition

Decentralization refers to the transfer of administrative, planning, management, and resource generation responsibilities from a central superordinate government authority to subordinate government and nongovernment agencies.

### Introduction

Generally, governance in Africa has undergone a monumental sea change since the initiation of democratic reforms by western governments and their ancillary international organizations, principally led by the World Bank. Part of the reformation process culminated in the widespread adoption and subsequent implementation of decentralization in many developing and transition countries. The benefits thereof essentially opened a germane space for constitutional consolidation that did not only guarantee but also contributed to trimming the edges of cooperate undertakings as far as institutional, constitutional, and overall governance is concerned. Because this has been the case, it became a de rigueur for countries to conform to certain quality governance standards (Crawford 2004) – one favorably inclined toward the plane of an all-inclusive participatory governance.

Ensuingly, decentralization has become an emblematic constituent of governance in various countries, including those with solvent and insolvent leadership structures, leftist, rightist, or centrist, as well as others with wavering civil society structures (Conyers 2007). With the coming into vogue of decentralization, it has gained the recognition as a reliably sustainable conduit to push through the vision of state reconstruction in many countries. As a consequence, post Ghana's emergence from the Provisional National Defence Council (PNDC) military rule under the leadership of then Flight Lieutenant Jerry John Rawlings (in the 1970s and 1980s), the transition leadership constituted to shepherd the nation to safety prioritized the enactment of a comprehensive decentralization program – as part of a broader road map to rooting democracy.

Precisely, the tone for decentralization was set via the passage of the PNDC Law 207 of 1988. Consistent with the political philosophy and vision of the then PNDC-led government, the overarching focus of the PNDC Law 207 was to extend power to the people while bringing democracy to their doorsteps (Ayee 2008). With the coming into being of the 1992 constitution of Ghana, and the Local Government Act 1993 (Act 462), the PNDC law on decentralization received an impetus. Though these constitutional arrangements laid the foundation for a broader stakeholder engagement in the governance process, it also catapulted into prominence the need to incept appropriate mechanisms that would

foster the extension of opportunities for people's participation at the various rungs of governance – as enshrined in Article 35, paragraph 6 *(d)* under the Directive Principles of State Policy of the 1992 constitution.

Proponents of decentralization have overtime emphasized on the overarching potency of the governance system to effectively and efficiently facilitate governance reinvention while propelling development in its multifaceted dimensions. A perusal of literature on decentralization underscores the concept as an enhancer of participation (Ahmad et al. 2005; Kauzya 2007; Blair 2000; Mohammed 2016; Michels 2011). Among other things, decentralization is touted as a reliable pathway to delivering public goods to populations, more particularly those of under-resourced provenance. At the same time, decentralization is acknowledged as a control valve for entrenching localized democracy, by way of pulling local citizens into the decision-making framework (Bawole 2017).

Moreover, Jutting et al. (2005) further posit that the active participation of the local people in the decision-making process will not only help expedite the reduction of poverty but also help in empowering the local people in diverse ways that will help them take their social, political, and economic destiny into their own hands. Katsiaouni (2003) also accentuates that by virtue of local people's involvement in the governance process, they are likely to develop a sense of system ownership, on the basis of which strong partnership could be forged between decentralized institutions and local people. This situation could further provide an anvil to forge a strong relationship driven by transparency, accountability, and trust (Bawole 2017).

However, notwithstanding the anticipated efficacy and benefits of decentralization, Crawford (2008) avers that dividends accrued from decentralization in developing countries have been unappealing and unsatisfactory. Part of the diagnosis of the malaise sharply brings into focus issues bordering on a dearth of institutional incapacity, corruption and patronage, fragile local accountability, and institutional opacity, among others. Against this backdrop, Bawole (2017) illuminates on the widespread and deep-seated mistrust among local people who perceive of local government system as a façade incepted and employed by elite government functionaries to plunder locally generated and/or allocated resources.

In this vein, Crawford (2008) and Bawole (2017) further not only bemoan the paucity of transparency and trust relative to local citizens' participation in decentralization but also expressed worry about the debilitating ramifications that such nagging undertones may engender – thereby posing substantial jettisoning threat to the noble purpose for which decentralization (as a special-purpose policy development machinery) is commissioned.

On this premise, our study sets out to empirically interrogate the pertinence of transparency and trust in decentralization and people's participation in the governance process. To the best of the knowledge of the authors, this is the first empirical investigation to be conducted in Ghana. Interrogating trust and transparency factors within the context of decentralization would contribute to building a robust research foundation and further aid in furnishing policy makers with sufficient pointers on factors that could contribute to strengthening governance, particularly at the local level. The remaining parts of the entry are segmented as follows. The next section discourses on literature review. This is followed by a treatise on Ghana's decentralized system structure. Subsequent section captures the theoretical underpinning and hypotheses of the study and methodology. This is followed by the discourse on results and practical and theoretical implications of the study. Finally, the study concludes by delineating the limitations and future research prospects.

## Literature Review

The efficient grinding of the wheels of constitutional reforms in developing countries ably ensconced political pluralism and also widened the political space for a broad-based political participation. With decentralization as the newly propagated political doctrine, in addition to participatory governance becoming an entrenched

feature of modern political administration, it also assumed the fad of a much bandied around vogue that caught the fascination of development stakeholders alike. In the views of the World Bank (2000), the existence of a mechanism in the shape and form of decentralization provides a forum for participation while hastening development (Ayee 2013).

Apparently, the existence of a decentralized development-driven framework appears to be steeped in the web of opinion divergence and incoherence. To this end, there is a dearth of uniformity. Whereas decentralization has been result-oriented in some countries, the reverse is however the case in most developing countries (Blair 2000; Baganda 2007; Crawford 2008). Inkoom (2011) shares the view that despite the comprehensive decentralized structures in Ghana, gains are yet to be realized as the decentralized process has not sufficiently enhanced or guaranteed expected results.

Enthrallingly, a significant amount of study on decentralization has been conducted in Ghana over the years. Inkoom (2011) for instance investigates the nature, processes, financing, and operationalization of decentralization in Ghana after two decades of implementation. Debrah (2014) also probes the politics of decentralization in Ghana's Fourth Republic. Specifying how decentralization has promoted popular participation and boosted local level autonomy in terms of decision-making, the study notes deficits such as mistrust, fund disbursements, and revenue generation ambiguities.

In another study spanning a space of five districts in Ghana, Mohammed (2016) investigates decentralization and participation, and revealed systemic structural shortfalls relative to participation, which has precipitated perceptions of exclusion. Bawole (2017) in a seminal inquiry into the potency of deploying decentralization as a poverty alleviation mechanism among other things revealed a confluence of factors including, but not limited to, resource constraints, dearth of collaborating state actors, and apathy of citizens as factors that have malnourished the gains of decentralization. These findings of these studies raise a plethora of issues bordering on decentralization drivers and local people participation – primarily anchored on trust and transparency. This observation actually constitutes the motivation to conduct an empirical investigation into decentralization and people's participation, taking into account cognizance, trust, and transparency.

## Structure of Ghana's Decentralization System

Historically, Ghana's local government system could be traced to the pre-independence era when governance of the native people was administered through the British indirect rule system. Governance under this system subsisted on native administrative structures helmed by traditional leaders from backgrounds of royalties (ILGS 2006). The local governance system since then has undergone phenomenal structural transitions – legal and constitutional. Emblematic of these remains the PNDC Local Government Law 207, Legislative Instrument (LI) 1589. Future landmark constitutional arrangements evidenced through the promulgation of the 1992 constitution of Ghana, Article 240 of Chapter 20, contributed to casting local governance in steel strength.

Ghana's constitution provides for a structure composed of national, regional, metropolitan, municipal, and district assemblies and subdistrict structures (Fig. 1). By composition, the metropolitan, municipal, and district assemblies (MMDAs) are composed of 70% members elected through universal adult suffrage. The remaining 30% are nominees of the incumbent president. The MMDAs are helmed by a chief executive whose nomination by the president is subject to the approval of 2/3 majority of the members of the MMDAs through voting (Ayee 2013).

Beneath the MMDAs lie the subdistrict structures operating at three distinct but interrelated structural levels. The metropolitan assembly level is segmented into sub-metropolitan district councils. Second are the urban councils, carved for jurisdictions with populations greater than 15, 000. The last is the nonelected body – town

**Decentralization and Citizens' Participation in Local Governance, Fig. 1** Local government structure in Ghana

councils – specifically for areas with populations ranging between 5000 and 15,000. These councils are made up of district assemblies and unit committee representatives of the metropolitan, municipal, and district chief executives. In these structures, the most vibrant and robust are the MMDAs who are vested with overwhelming political and administrative powers to act as local government representatives at the local levels (Gyimah-Boadi 2009). Among other functions, they are constitutionally mandated under Section 10 *(5) of Act 462* of the Local Government Act to coordinate and execute district development plans and other development initiatives led by government ministries, departments, agencies, and other development partners including non-governmental organizations. As posited by Gyimah-Boadi (2009), they also have extensive responsibilities to not only control public services but also make policy decisions.

## Theoretical Underpinning of the Study

The theory of decentralization is touted as a reformative political and administrative tool capable of forging an all-inclusive participation so far as governance is concerned. As one of the cardinal ubiquitous governance theories, it has been variously, altogether, broadly conceptualized. In the views of Rondinelli and Cheema (1983), decentralization refers to the transfer of decision-making or administrative authority from a superordinate central government to its field constituents, local administrative units, semiautonomous and other parastatal entities, and local government or nongovernmental organizations. This definition captures decentralization as not only a single thread that weaves through variants of structures but also presents the system as a well-architectured and efficiently coordinated network that integrates diverse structures into a homogenous entity.

Unpacking decentralization leaves us with a tripod of concepts converging around political, administrative, and fiscal. Whereas political decentralization refers to the transfer of political powers to semiautonomous bodies for political decision-making purposes like legislation, administrative decentralization on the other hand refers to the transfer of powers to subordinate entities for administrative purposes including, but not limited to, human resource recruitment. Finally, fiscal decentralization is used in reference to the designation of autonomous powers for revenue generation and control (Tang and Huhe 2016).

These strands of decentralization are essentially initiated for the purposes of making government responsive to the needs of grassroots people and, at the same time, create a viable atmosphere for their involvement in the decision-making process (Sewell and Coppock 1977; Midgley 1986; Tosun 2000; Mohammed 2016). Participation of the people in the decision-making process in Africa is reported to be impoverished. Tosun (2000) and Mohammed (2016) ascribe the situation to local people's feeling of alienation. Other reasons advanced to illuminate on the participation deficit include regime uncertainty (Ohemeng 2005; Edigheji 2008), patronage, and coercion (Mhone 2003).

It is in view of the need to enhance participation that decentralization is touted and implemented. However, years of experimentation are yet to corroborate this generalization (Van de Walle 2003; Francis and James 2003). In a study attempting to synthesize disparate strands of factors weakening the structural efficacy of decentralization structures, Porumbescu (2015) excavates issues of "closures" and concludes on the need for openness to strengthen participation in decentralization. From the foregoing, the study argues that trust and transparency could strengthen citizens' relationship with decentralized agencies and further their participation in the decision-making process.

## Hypothesis Development

The study proposes nine (9) hypotheses. Six (6) of these hypotheses are delineating causal relationships, while the other three (3) are with significant bearings on the mediating roles of trust and transparency on the relationship between decentralization and local people's participation in local governance affairs.

## Decentralization and Participation

The proximate reason for the overwhelming touting of decentralization is predicated on its utility to grant citizens a considerable role and space in decisions pertaining to their welfare. This is ensured through the recognition of the roles of the local people in articulating needs, also ensuring that the design and provision of same are responsive to their sociocultural peculiarities. The people-centered nature of decentralization, inclined toward a broader stakeholder engagement in the decision-making process, helps in empowering local people (Blair 2000) which contributes to augmenting their appreciation of the governance process. Furthermore, the recognition offered them, and their opinion in the decision-making process imbibes them with a sense of recognition within the governance structure. Given this situation,

their sense of commitment to the governance process becomes elevated, thereby enhancing participation. In view of this, the study hypothesizes that:

**H1**: Decentralization has a significant positive relationship with local people's participation in local governance.

Moreover, given the participation of the local people in the day-to-day local governance process, they end up becoming integral partners and/or stakeholders. Explicitly, instituting and entrenching practical measures such as ensuring information transmission from councilors to electorates, promoting the regularity of councilor-electorate meetings, and the subsequent exchange of ideas between institutions and the local people could go a long way to strengthen the decentralization process (Bawole 2017). By extension, it is imperative to state that this may enhance their understanding of government undertakings. A fair understanding of these processes could help in curing local people's perception of fiscal and administrative opacity surrounding the engagements of local authorities in developing countries, particularly Ghana (Debrah 2014). Contextualizing the discourse, our study posits that efforts toward governance reforms targeted at either initiating or strengthening local governance should prioritize transparency. Transparency would further entrench trust between the local people and the subnational government structures. The prevalence of trust would in turn help in boosting cooperation, which is germane for pursuing socioeconomic developments. In view of the foregoing discourse, the study hypothesizes the following:

**H2**: There is a significant positive relationship between decentralization and transparency such that an appreciable dosage of transparency will enhance decentralization.

**H3**: There is a significant positive relationship between decentralization and trust such that an increase in local people trust in decentralized system will enhance decentralization.

## Transparency

One of the much often referenced debate in pursuit of institutional reforms in developing countries has been the clarion call for transparency. Essentially, the tenets of transparency, among other things, seek to advance institutional diligence, effectiveness, and efficiency (Grimmelikhuijsen and Meijer 2014), in furtherance of collaborative governance (Sørensen and Torfing 2012). Transparency denotes the extent at which stakeholders are accorded frequent access, relative to the operations of public organizations (Meijer 2013). Transparency enhances decision-making and understanding (Pina et al., 2007), while building up citizens' understanding. Transparency entrenches institutional responsiveness and trustworthiness (Goetz and Jenkins 2001; Porumbescu et al. 2015). The advocacy of transparency has led to the development of several frameworks including the four-dimensional frameworks of Cucciniello and Nasi (2014).

The first dimension of this framework is the institutional (disclosure of public organization information). The second dimension is the political (i.e., information about political representation), third financial (i.e., disclosures about financial resources allocated), and fourth service delivery (i.e., how local government delivers public service). Another framework presents three components (Grimmelikhuijsen 2012) including decision-making transparency (i.e., stakeholders' access to policy decisions); policy transparency (i.e., how adopted policies intend to address issues); and policy outcome transparency (i.e., provision of information detailing the actual policy impacts).

Though studies (O'Neill 2002; Prat 2005; Porumbescu and Im 2015) have confirmed the adverse effects of transparency, it would not be out of place or, perhaps, hyperbolic to emphasize its relevance in influencing peoples trust and participation in local governance. Im et al. (2013) confirm the utility of transparency to organizational efficacy. Moreover, in addition to transparency enhancing stakeholder trust (Porumbescu 2016), it also embeds a favorable public perception of value for state institutions. Replicating this

logic within the context of local governance, it could be generalized that transparency could boost citizens' participation. Moreover, a more positive perception with regard to transparency could also amplify stakeholder trust. From the foregoing discourse, the following hypothesis is proposed:

**H4**: Transparency in decentralization has a significant positive impact on local people's participation in the local governance.
**H5**: Transparency in decentralization has a significant positive impact on local people's trust in local governance.

## Trust

Trust has been established within social science discourses as a significant influencer of people in decision-making processes. Despite the various applications of trust in diverse disciplines, its fundamental interpretation reinforces the notion of a psychological measure or judgment of honesty in relations to an individual, group of individuals, or organization (Tschannen-Moran and Hoy 2000; Rawlins 2008). Porumbescu (2016) is of the strong view that transparency in local government engenders trust among stakeholders. This confirms the significance of trust in local governance affairs. From another study in South Korea, Park and Blenkinsopp (2011) corroborate the relevance of citizens' trust on stakeholder satisfaction. A careful consideration of these studies indicates the centrality of trust in diverse areas of organizational setup. In view of these prior studies, the same logic is replicated, and as such, the following hypothesis is proposed:

**H6**: Trust has a significant positive impact on local people's participation.
**H7**: Transparency has a significant mediating effect on the relationship between decentralization and local people's participation in the local governance.
**H8**: Trust has a significant mediating effect on the relationship between decentralization and local people's participation in the local governance.
**H9**: **Transparency and trust have a** significant mediating effect on the relationship between decentralization and local people's participation in the local governance.

## Research Methodology

### Sample and Data Collection

The research employed a questionnaire-based approach to elicit data to investigate the discourse of trust and transparency in decentralization and local people's participation in local government. With recourse to literature, a questionnaire was designed. Considering the research objective, using convenient sampling technique, data was drawn. To this end, the survey method anchored on the structural equation modeling (SEM) technique was employed. The survey method was preferred to interview and experiment because it helps to predict behavior and association between constructs (Newsted et al. 1998). With reference to prior studies, constructs and their various indicators were adapted. They were further refined to suit the study context. Our study population sampled in Ghana was composed of residents in metropolitan, municipal, and district assemblies across Ghana. The selection of the study areas was based on the recommendations of a government regulatory authority with local government working relations. Prior to data collection, the study designed questionnaires which were reviewed and modified by four expert professors who helped to enhance its clarity and comprehension. Prior to data collection, a pilot study was conducted with 50 respondents, and the outcome was satisfactory. The results of this pilot were however not included in the final data. Data collection from 10/12/2019 to 15/03/2020 issued 400 questionnaires to respondents. In the end, the study gathered 375 responses, representing 94% response rate. After removing questionnaires with incomplete responses, 338 useable questionnaires remained. To increase responses, the research team made follow-up calls as a reminder. And to avoid biases in responses, respondents were not offered any incentive. Given that sample data were elicited from different areas, Chi-square

test and t-test were conducted to test differences between study samples (Armstrong and Overton 1977). The results suggested no significant differences. The sociodemographic composition of our study sample is presented in Table 1. The research ensured anonymity of respondent's information. Also, respondents were assured that information provided was for academic purposes only.

## Measures

Our study was composed of sixteen (16) questions disseminated over four (4) constructs. The scales and instruments employed for the study were adapted from prior literature that had established their respective reliability and validity within the study domain. Study items were measured with multiple items anchored on a five-point Likert scale ranging from "strongly disagree" (1) to "strongly agree" (5). Cheng and Chen (2015) and Dawes (2008) have suggested that a five-point Likert scale is easy to foster understanding better than a seven-point Likert scale. Study instruments were adapted from prior validated study instruments. Considerable changes were made in the language of the questions to suit the study context. Items for "decentralization" (five items) were adapted from Inkoom (2011). Also, items for "participation" (three items) were also adapted from Mohammed (2016). Moreover, items for "transparency" (three items) were adapted from Mishra and Bekuretsion (2020). And finally, items for "trust" (five items) were adapted from Mishra and Bekuretsion (2020). To enhance respondents' understanding of the study, an overview of the research was provided at the start of the questionnaire. Respondents were assured of their anonymity guaranteed that the data provided will solely be used for academic purposes.

**Decentralization and Citizens' Participation in Local Governance, Table 1** Demographic characteristics of respondents (N = 338)

| Characteristics | Frequency *(N)* | Percentage (%) |
|---|---|---|
| *Gender* | | |
| Male | 173 | 51 |
| Female | 165 | 49 |
| *Age* | | |
| 18–25 | 55 | 16 |
| 26–35 | 83 | 25 |
| 36–45 | 78 | 23 |
| 46–55 | 88 | 26 |
| 55+ | 34 | 10 |
| *Level of education* | | |
| Primary | 46 | 14 |
| Secondary | 39 | 11 |
| Tertiary and above | 220 | 65 |
| No formal education | 33 | 10 |
| *Number of years stayed in the area* | | |
| <2 | 45 | 13 |
| 3–5 | 76 | 23 |
| 6–10 | 95 | 28 |
| 11–15 | 40 | 12 |
| 15+ | 82 | 24 |
| *Area of stay* | | |
| Metropolitan | 145 | 43 |
| Municipal | 85 | 25 |
| District | 108 | 32 |

### Results

Among study participants, females constituted 165 (49%) and males were 173 (49%), representing sufficient distribution of respondents across the gender spectrum. Regarding age distribution, respondents aged between 18 and 25 were 55 (16%). Whereas those between the ages of 26–35 were 83 (25%), those between 36 and 45 were 78 (23%). Also, those between 45 and 55 were 88 (26%), and finally, respondents aged 55 and above were 34 (10%). Relative to distribution in terms of level of education, primary education recipients were 46 (14), secondary education were 39 (11), tertiary and above were 220 (65%), and, finally, those without any formal education were 33 (10%).

## Descriptive Statistics

Data analysis using SmartPLS software version 23 revealed results of factor loadings to be greater than 0.70. This symbolized a significant model strength, consistent with the benchmark values recommended by Hair et al. (1992) and Garson (2016). Table 2 presents mean, standard deviation, and Cronbach alpha values of the proposed four constructs employed for the study. Cronbach alpha values are essentially used to determine the reliability of scale of study constructs, which signifies a demonstration of the internal consistency of items measuring the same constructs (Hair et al. 1992; Zikmund 1994). The test of reliability analysis confirmed that variables were reconcilable with acceptable levels proposed by Gliem and Gliem (2003). The greater Cronbach alpha values of our results could be attributed to the strong internal consistency for study items (Weerakkody et al. 2016). Furthermore, results of inter-item correlations revealed values to be <0.45. Study constructs recorded a mean value greater than 3. This signifies the favorable response of respondents to study instruments. Results of standard deviation for all constructs were approximately 1.00. This confirms the non-fluctuation of respondents across mean value scores.

## Outer Model Testing (Measurement Model)

Next, our study conducted an outer model test, also referred to as test of measurement model, using SmartPLS software. In this regard, the four procedure recommendations of Ringle et al. (2014) were followed. These procedures include the test of Cronbach alpha and composite reliability (CR), average variance extracted (AVE), discriminant analysis, and t-test. Table 2 presents Cronbach alpha values establishing the internal reliability of proposed study constructs. In presenting the output of SmartPLS, a reflexive figure capturing latent and measured indicator variables was presented. Moreover, in presenting estimations of analysis, PLS algorithm with recourse to presenting paths in weighting scheme was employed. Path weighting scheme is mostly used in reference to the structural equation modeling (Ringle et al. 2014). Table 2 presents the scores of mean, standard deviation, and Cronbach alpha.

Table 3 presents the values of factor loadings (FL), composite reliability (CR), and average variance extracted (AVE). The values captured in the table demonstrate their significance, sufficiency, and consistency with the recommended benchmarks of a minimum of 0.70 (Henseler et al.

**Decentralization and Citizens' Participation in Local Governance, Table 2** Descriptive statistics of study items (N = 338)

| Constructs | Mean | Standard deviation | Cronbach's alpha (α) |
|---|---|---|---|
| Decentralization (DEC) | 3.70 | 0.99 | 0.922 |
| People's participation (PPA) | 3.57 | 1.04 | 0.898 |
| Transparency (TRA) | 3.86 | 1.05 | 0.898 |
| Trust (TR) | 3.85 | 0.89 | 0.947 |

2015). Composite reliability measures were also reconcilable with the proposed minimum threshold of 0.70 (Nunally 1978; Hair et al. 1992). Furthermore, the use of SmartPLS aided in the computation and generation of AVE scores for the proposed study constructs (Table 3). In situations where a measure does not highly correlate with another from which it must differ, results of AVE values help in describing verified discriminant validity (Netemeyer et al. 1990). Values of AVE greater than 0.5 signify a good convergent validity of the questionnaire (Fornell and Larcker 1981). AVE values below the recommended threshold of 0.50 signify a greater error in variance than explained variance (Garson 2016). Our results of AVE ranged from 0.762 to 0.831. In effect, convergent validity was attained by estimating factor loadings, convergent reliability, and average variance extracted values (Anderson and Gerbing 1988). In terms of discriminant validity, the criterion of Fornell and Larcker (1981) and the heterotrait-monotrait ratio (HTMT) were considered. In view of this, factor correlations between the pair of latent variables should not be below the AVE square root via the factor correlation matrix (Table 4).

AVE values for the respective variables diagonally presented in bold fonts (Table 4) indicate that variables are greater than correlation for any pair of variables. Heterotrait-monotrait ratio was simultaneously, albeit, complementarily checked to take care of the shortfalls inherent in the Fornell

and Larcker (1981) criterion as identified by Garson (2016) and ably supported by Henseler et al. (2015). An appropriate and suitable heterotrait correlation should be lesser than the monotrait correlations. The proposed ideal monotrait-heterotrait ratio, per the recommended criterion of Henseler et al. (2015), should be below 0.90. In a more stringent situation, Kline (2011) recommends a cutoff point of 0.85 as the benchmark for establishing and grounding discriminant validity. Moreover, estimates of *t-values* of the outer model (measurement model) were attained using the bootstrapping method with 5000 subsamples. Results of bootstrapping helped in approximating the normality of elicited data (Wong 2013). In presenting bootstrap results, two-tailed tests were significant at a level of 0.05. On this basis, our research found path coefficients to be significant as they were greater than 1.96 (Wong 2013).

## Inner Model Testing (Structural Model)

In checking the validity of the structural model, with recourse to previous studies that had adopted the SmartPLS approach, model fit values were derived. Following the recommendations of Ringle et al. (2014), the procedures considered in establishing the measurement model were anchored on SEM through partial least squares approach. Precisely, the study considered t-test, Pearson's determination coefficient evaluation ($R^2$), and the interpretation of path coefficients. As a requirement for the evaluation of outer measurement model, a t-test was conducted. These values constituted the basis for reporting t-values for the inner structural model (Table 5). Table 6 presents path coefficients results of *t-values* and *p-values* generated through the bootstrapping method. Path coefficients, as presented in the t-statistics, indicate their consistency with the recommended criterion of Wong (2013). Moreover, $R^2$ square values were also checked, confirming a significance of *t* and $R^2$ values of participation, trust, and transparency, at a level of $p < 0.05$. Actually, the value of $R^2$ presents an evaluation of the components of variance of endogenous variables explained by the structural model. This further indicates the quality, suitability, and appropriateness of the model (Ringle et al. 2014).

$R^2$ values include small (2%), medium (13%), and large (26%) (Cohen 1988). Results of $R^2$ of SmartPLS output indicate the following: people's participation ($R^2 = 0.189$), transparency ($R^2 = 0.178$), and trust ($R^2 = 0.248$). Trust was revealed to have recorded the largest variance followed by people's participation and, finally, transparency. Results of path coefficient of the study are presented in Table 7. The results of the path coefficients, and the significance of the

model relationship validates and confirms the appropriateness of the research model which signifies an explained total variance of 18.9% on people's participation with the most acceptable paths as presented in Fig. 2.

## Discussion

The purpose of our study was to investigate the role of transparency and trust on the symbiotic relationship of decentralization and local people's participation in the local governance process. Our discourse was situated within the theoretical precinct of decentralization. In furtherance of our study objectives, our research put forward a four-construct model composed of nine (9) hypotheses. Six of these hypotheses were sought to establish causal relationships between study constructs, while the remaining three (3) were inclined to test their mediating effects on the relationship between study constructs.

The results of our study revealed a significant positive relationship between decentralization and people participation in the local governance process. This indicates that the establishment of subnational government bodies assuages the challenge of remoteness occasioned by the centralized government structure operated in Ghana. Establishing subnational bodies makes it apparent that the government has been brought to the doorsteps of the people. The existence of these structures comes with the benefit of enhancing stakeholder participation in the governance process while efficiently aiding community development. The inherent potency of decentralization provides a springboard for advancing broader stakeholder participation as echoed by Mohammed (2016).

Moreover, our study established a positive relationship between decentralization and transparency such that an appreciable dosage of transparency augments local people's participation in decentralization. This is reconcilable with our

hypothesis 2. Prior study findings have accentuated the relevance of transparency within the corporate context of governance (Porumbescu 2015; Park and Blenkinsopp 2011). The results underscore the fact that full disclosures on local government engagements, including, but not restricted to, information on fiscal and other administrative matters, are pertinent to local governance.

Similarly, our study confirmed the significant positive relationship between decentralization and trust such that an increase in local people trust in decentralized system enhances decentralization as proposed under hypothesis 3. This is an attestation to the study findings of Porumbescu (2015) and Hood (2006). In view of this finding, it is apparent that, part of the source of local people good will to, and cooperation with subnational structures could emanate from local people's trust. This therefore makes it necessary for local government bodies, being metropolitan, municipal, district, and their affiliate subordinate bodies, to prioritize not only accountability but also communication and information flow on fiscal, policy, and general administrative issues.

Moreover, in confirmation of hypothesis 4, this study also identified transparency to have a significant impact on local people's participation in the local governance process. Our finding is consistent with the proposition of Porumbescu (2015) and Grimmelikhuijsen et al. (2012, 2017). The study finding could be interpreted to imply that, given the closeness of subnational entities (as service administration entities) to the local people (as service recipient) and their environment, vis-à-vis the strong working relationships, it is obvious that excellence or otherwise in service delivery could either enhance or impair participation of the latter – which is not only indispensable but also a sine qua non to the success and survival of the former. In much the same vein, in confirmation of hypothesis 5, our study revealed a positive relationship between transparency and local people's trust in local governance systems and processes. Also, our study confirmed trust has a significant positive effect on local people's participation. This is in accord with Douglas and Meijer (2016 and Porumbescu (2015) (Fig. 3).

In conducting the test of mediation, the research followed the recommendations of MacKinnon et al. (2007). In this regard, whenever direct and indirect effects are significant, then there exists a partial mediation effect. On this basis, our study found transparency to have a partial mediating effect on the relationship between decentralization and local people participation. This is in support of the study hypothesis 7. In the next mediation test, our study revealed that trust has a significant partial mediating effect on the relationship between decentralization and local people's participation in the local governance process. This supported our hypothesis 8. And finally, the direct effect (0.138) and indirect effect (0.019) of the total effect model (DAG → TRA → TGA → PPA) are both significant, indicating a partial mediation. However, the total effect model resulted in a much higher path coefficient of 0.306, which can be attributed to the levels of interactions among the mediators.

Overall, our study concludes that decentralization as an efficient tool for enhancing broader stakeholder participation and general development around the world could be made more efficacious when trust and transparency are ensured. As one of the most extensively embraced result-oriented development concepts with an increasing primacy and emphasis on countervailing remoteness in governance, it is therefore important that it is subjected to constant efficiency test via research. Such endeavors would help troubleshoot possible factors likely to impair or negate inherent gains. Within the context of development, and more particularly within the confines of Sustainable Development Goals (SDGs), in view of the essential services that subnational structures provide, while it would be convenient to assert that the realization of the integrated SDGs is hinged on the existence of efficient local governance structures, it would in much the same vein be more appropriate to conclude that ensuring a functional system requires investigation and further understanding of the issues raised in our study.

**Decentralization and Citizens' Participation in Local Governance, Fig. 3** Research model with path results of path coefficient

## Implications for Theory

Situating the study within the theoretical framework of decentralization helps in investigating and describing how decentralization could enhance a broader citizen participation in a given context. Decentralization has become a commonplace practice as far as governance is concerned. It essentially involves the institution of a system that is responsive to the needs of the people. Findings from this study confirm that decentralization has a greater prospect for enhancing citizens' participation. By putting forward a theoretical model situated within the context of decentralization, integrated with trust, transparency, and participation factors, our study contributes to theory. Our study confirms that trust has the potency to strengthen decentralization. The finding of our study further confirms that trust could also enhance decentralization. Altogether, the study findings confirm the significance of trust and transparency in relation to not only decentralization but also participation in the decentralization system.

## Implications for Practice

The study findings have tremendous ramifications for the state and non-state stakeholders particularly in Ghana and generally across the world. Given that no empirical study has explored the discourse of participation in local governance in Ghana, our study comes in handy with findings proffering sufficient pointers for policy-making purposes. Given that Ghana's democracy is still in transition, and undergoing a series of reforms, our study findings will be seminal to inform present and future reforms. Central to the pursuit of these reforms, proponents and reform advocates should focus on advancing the tenets of trust and transparency, as part of broader efforts and measures to enhance system efficiency and effectiveness anchored on a people-centered participation.

This would be essential to entrenching trust among a broad spectrum of the local people.

## Conclusion

In view of the prime focus of our study, we interrogated the mediating effects of transparency and trust on the relationship between decentralized structures and local people participation within the context of Ghana. Our study further examined the relationship between transparency, trust, and local people participation within the spheres of decentralization. Our study was situated within the theoretical precincts of decentralization. Results of our study were from a study sample of 338. Data was elicited from a wider population across municipalities, metropolitan, and districts in five regions in Ghana to ground the research model. The results of our study confirmed the nine hypotheses put forth for the study. The study outcome corroborates the significance of trust and transparency as significant boosters of decentralization and people's participation in this system. Overall, the model contributed a total of 18.9% explained variance.

## Limitations and Future Research

This is the first empirical study to investigate and report on decentralization, people's participation, and the significance of trust and transparency. Our study drew data from metropolitan, municipal, and districts across five regions in Ghana. As such, generalization of the study findings may not be applicable in other areas beyond these jurisdictions. Our study employed a quantitative approach. This may have limited the generation of in-depth responses mostly occasioned by the use of closed-ended instruments. On this score, our study recommends future studies to employ an open-ended instrument for qualitative studies targeted at eliciting in-depth responses. Given the limited areas selected for the study, future studies may also consider drawing data from a larger study sample across Ghana while testing other factors likely to enhance participation.

# Decentralization and Economic Growth in International Context

Boris Morozov
Stephen Poorman College of Business, Information Science, and Human Services, Lock Haven University of Pennsylvania, Lock Haven, PA, USA

## Synonyms

Decentralization; Economic growth; Federalism; International comparative studies

## Definitions

*Decentralization* is the transfer by the central government to subnational governments (states, regions, municipalities, etc.) of specific functions along with the administrative authority and economic resources to perform those functions.

## Introduction

The concept of decentralization has attracted the attention of scholars and policymakers alike for a number of decades. Recent research has deepened our understanding of decentralization. Yet there still remains a significant amount of confusion over its measurement and its contribution to an economy. Current literature on decentralization is characterized by the multitude of conflicting definitions and measurement instruments. Current literature on the relationship of decentralization and economic growth is also mixed. The primary purpose of this article is the discussion of the decentralization measurement instrument developed, calibrated, and assessed by Morozov (2016, 2017) and its implications for the theory and policy. In addition, this entry discusses the implications for the theory and practice of policymaking by addressing the explicitly tested relationships between decentralization and economic growth (Morozov 2017). It also identifies such potentially fruitful venues of research on decentralization and its relationship with other processes as democracy, government accountability, and government responsiveness to citizens' preferences and needs.

### Theoretical Discussions and Relevance of Decentralization

The twentieth century can be described as a century in which governments are providing an increasing amount of services and products to their constituents. Such an increase in the amount of services provided presents a significant challenge to the government structures. As such, the service delivery responsibility has to be carefully analyzed. The need for such an analysis stems

from the fact that different levels of governments are better equipped to provide different types of services. There are three major functions of the public sector (Morozov 2016): macro-economic stabilization, wealth redistribution, and resource allocation. To a certain degree, these three functions are performed by all levels of government. However, central government is much better equipped to address the first two functions: economic stability and wealth redistribution. While the central government also participates in the resource allocation function, the local implementation of that function depends primarily on subnational governments. It is important to acknowledge that these three functions are implemented through a series of specific and targeted programs, which are administered by different levels of government. During the twentieth century, the quantity of these specific services performed by subnational governments increased significantly. Thus, the continuous quest for what would be the appropriate distribution of responsibilities among government levels was undertaken. This shift towards subnational government delivery of services, known as the process of decentralization, has been the subject of careful attention and analysis by both scholars and practitioners.

Recent research has responded to the development of decentralization and has deepened our understanding of the process and its connections to such outcomes as economic growth, inequality, and quality of governance. Despite the topic's uninterrupted popularity, the body of knowledge on decentralization can best be characterized as marked by multiple definitions and operationalizations of the process. Such a multitude of definitions presents a major drawback for any rigorous attempt to carefully decipher the influence that the decentralization process might have on other socioeconomic processes. For example, lack of an adequate measure of decentralization made it difficult to analyze the potential benefits and/or shortcomings associated with it.

Thus, this entry was written in response to the need for an accurate and aggregate measure of decentralization. One of the major contributions of this entry was to develop a measurement instrument that would address the multitude of existing definitions and operationalizations of the phenomenon by bringing a sense of consistency and accuracy to the interpretation of what is referred to as the "decentralization process." The newly developed measure of decentralization was later used in different research to specifically test the existing theoretical relations between decentralization and the economic growth of nations. The actual analysis and interpretations of decentralization model building, theoretical concepts, as well as challenges presented by the very complicated nature of the concept under discussion are presented in two distinct articles (Morozov 2016, 2017).

## Decentralization Study: Summary and Overall Findings

More and more countries around the world have embarked on some sort of decentralization process because of the potential benefits associated with it and/or despite the possible dangers. By no means is this manuscript the final answer to the intricacies and complexities of the decentralization process, its measurement and evaluation, or its relationship to economic growth. More and more nations have some level of decentralization of their public sector. Despite its popularity, the concept of decentralization still suffers from conceptual confusion (Ebel and Yilmaz (2004) have multiple definitions of decentralization measures). Such theoretical confusion has a significant negative influence on a nation's ability to develop a system of decentralization that would be adequate to that nation's needs and necessities. Current research on decentralization can be accurately described through the existence of multiple definitions of decentralization. Very often these definitions are mutually exclusive and, simply, contradictory. The situation is not exactly helped by the multi-dimensional nature of decentralization. As a result of this multidimensionality, decentralization is conflated with other concepts, especially these that also have a theoretically positive value, such as democracy and market economy.

A commonly used taxonomy of the decentralization process defines it in terms of its economic, political, and administrative dimensions. As such, this classification is not new, and it provides a good starting point for the analysis of the process. Thus, the author of this study has employed the formal definition of decentralization as the transfer by the central government to subnational governments (states, regions, municipalities, etc.) of specific functions along with the administrative authority and economic resources to perform those functions. This definition accurately captures the essence of the decentralization process and, thus, sets up the framework for analysis of the first set of research questions, which is related to the essence of the process.

The first question to be answered (Morozov 2016) was "To what degree can the 'decentralization system' be understood in terms of the economic, political, and administrative dimensions?" The obvious question here was about the exhaustiveness of the proposed framework. One of the crucial points is whether or not the list of decentralization dimensions is exhaustive. Do these three dimensions adequately and accurately describe the process, or is there another dimension to it? This brings us to the first significant finding of this article.

Indeed, the decentralization process can be understood in terms of economics, political science, and public administration. In fact, decentralization would not be feasible if any of the abovementioned dimensions were not present in the mix. However, the decentralization process works somewhat differently from what has been previously hypothesized by multiple researchers and practitioners. Specifically, the long-hypothesized three-pronged model of decentralization is in fact two-dimensional (Morozov 2016).

Our sample analysis revealed that the decentralization process is best explained by a combination of two latent dimensions of decentralization. The first dimension is economic in nature. This dimension consists of three observed factors: share of subnational revenues, share of subnational expenditures, and share of subnational revenues received by subnational governments from taxation sources. The implication of this finding is the fact that even purely economic variables of the decentralization process exhibit the interconnectedness of the process. It was theorized that the share of subnational revenues from taxes is indicative of subnational governments' administrative autonomy and, thus, should be more closely aligned with the administrative dimension of decentralization. However, this was not the case. Instead, we did find that economic variables align along an economic dimension. In other words, economic variables are correlated, forming the economic dimension of the decentralization process. But, such an alignment shows that there is a necessary correlation between share of subnational taxes and other observed variables that are theoretically representative of the administrative dimension of decentralization, such as government efficiency, rule of law, control of corruption, and regulatory quality. This brings us to the next dimension of the decentralization process. We have theorized that two other separate dimensions of decentralization process are political and administrative decentralization. This was not the case. In fact, the political and administrative dimensions of the process are not two separate dimensions. In fact, decentralization in terms of political science and public administration is not a dichotomy, but a combination. In other words, the six variables that defined the political and administrative dimensions of the decentralization process are highly correlated. Thus, based on our sample and analysis, we concluded that political and administrative decentralization are nothing more than a single dimension that contributes to the explanation of the essence of decentralization. The practical implication of this finding is the fact that decentralization systems should include measures that address both political and administrative reforms of a nation at the same time. These findings suggest that it would be inaccurate to separate these two aspects of decentralization. In other words, the interdimensional connectedness of the decentralization process requires simultaneous treatment. This implication brings us to the next important

observation: the interconnectedness of the observed dimensions of the decentralization process.

Two separate, but intertwined, dimensions of the decentralization process are the economic one and a combination of the administrative and political aspects. This correlated nature of the phenomenon supports the existing consensus among scholars and practitioners that decentralization should be viewed as a comprehensive system of economic, political, and administrative mechanisms that is aimed at bringing the government closer to its constituents. However, it is important to note that, even though these two dimensions of decentralization are interrelated, they can be analyzed separately. In other words, it is possible to dissect the entire process of decentralization into smaller blocks and develop solutions for existing problems within the limits of these smaller blocks. This approach may be appropriate because different countries face different issues in their decentralization reform. Thus, segregation of the entire decentralization process into smaller blocks might yield more accurate results and better recommendations for countries pursuing decentralization. However, the possibility of separate analysis of economic factors and administrative-political components of decentralization does not imply that changes in one dimension will not be reflected in another. This brings us to the first extremely important conclusion regarding the essence of the decentralization process.

As previously mentioned, current literature on decentralization suffers from multiple and often contradictory definitions of the process. Additionally, there is the argument that the multiplicity of decentralization definitions and measurement instruments is unavoidable because of its cross-disciplinary nature. As this article demonstrates, it is feasible to derive a unique definition of the process. It is possible not only to do so but also to develop a measurement instrument that captures the multi-disciplinary nature of decentralization in a statistically and methodologically impeccable manner. As demonstrated by Morozov (2016), the newly proposed measurement of decentralization is a significant improvement over existing alternatives for several reasons. The first is conceptual in nature and can be explained through the fact that our measurement instrument of decentralization adequately addresses the inter-disciplinary nature of the phenomenon under analysis by including all dimensions of the process in it. The second is technical in nature, and it specifically addresses the issue of goodness of fit of the instrument to the data. Our analysis (2016) clearly shows that the newly developed index is statistically sound, unlike other most commonly used indicators. The implication of this is that our index addresses the decentralization measurement problem in such a way that it reflects the multi-dimensional nature of the process and it does so statistically accurately. Thus, the first set research questions of this research about the structure of the decentralization process has been properly addressed and answered. However, answering the question about the measurement of the decentralization process does not address the existing theory on benefits and drawbacks that are theoretically associated with the process. The next part section will do so.

## Decentralization Process and Economic Growth – Evidence and Consequences

As previously mentioned, decentralization is a multi-dimensional process. Numerous nations have embarked on some sort of decentralization reform in an effort to achieve the theoretical benefits associated with the process. Such fascination with decentralization reform can be partially explained by the strong support of international organizations such as the World Bank and the International Monetary Fund. However, lack of an accurate and adequate measurement instrument for the decentralization process has created a string of theoretical discussions about both the dangers and the benefits of decentralization. Having developed an accurate measurement instrument of decentralization, we will discuss the second research contribution concerning relationship of decentralization to/with economic growth.

The research question is actually a series of interrelated questions that can be stated as follows: "Does decentralization cause economic growth, or is it a consequence of economic growth? If decentralization causes growth, then what type of relationship is it? Is it linear, or is it non-linear as Theissen (2003) hypothesizes?" Morozov (2017) has examined the linkages between decentralization and economic growth. The measurement of decentralization was developed as a part of his research, and the results of this research have previously been presented and discussed (Morozov 2016, 2017).

The starting point for discussion of the findings of this section is the fact that we were able to replicate the results by Mankiw, Romer, and Weild (MRW) regarding the explanatory factors of economic growth. We have found that almost 60% of the economic growth in a country is explained by the country's savings rate, capital formation ratio, and government (Morozov 2017). Previously mentioned factors exercised a positive and statistically significant linear influence on economic growth. This finding is consistent with both theory and practice. The most important factor of influence on a country's growth rate is capital formation. The formal definition of capital formation is "the transfer of savings from households and governments to the business sector, resulting in increased output and economic expansion." Such a definition is consistent with the rest of our findings, according to which the other two statistically significant factors of influence on the economic growth rate are household savings and government share in GDP. All of these findings are consistent with the theory and empirical evidence from other researchers.

At the same time, we found that the quality of the labor force was not statistically significant in our analysis. The potential explanation of such finding is twofold. The first source of possible problems is the operationalization of the quality of the labor force. We followed MRW approach in defining it. We took the gross enrollment ratio in the secondary level of education. This operationalization is less than perfect because it ignores both primary education and the tertiary level of education. Development of a measure that would adequately capture the quality of the labor force represents an interesting and potentially fruitful topic of research and could be a manuscript topic on its own. The second reason why our operationalization of the quality of the labor force was not statistically significant is the limited nature of the time series. Our sample consisted of 37 cross-sectional observations over 8 years. Introducing a one-year lag reduced the time frame of the analysis to 7 periods. It is clear that completion of the formal education process takes longer than 7 years. Therefore, it is not surprising that this variable was insignificant. The potential solution to this problem could be a longitudinal dataset that contains more than 8 years of cross-sectional data.

The most striking finding of this analysis is the fact that the index of decentralization does not contribute to the economic growth of a nation. In other words, the empirical evidence presented by Morozov (2017) suggests that the decentralization process, whether undertaken by a nation or not, does not affect a nation's economic growth rate. In other words, decentralization might be pursued for other reasons such as accountability and the eradication of corruption. But the argument that decentralization significantly contributes to the economic growth of a nation is not justified. At least, it is not justified in our sample and for our time frame of analysis.

## Discussion of Arguments for the Benefits of Decentralization

With more and more attention being paid to subnational government, the decentralization movement has enjoyed significant attention from scholars of various disciplines. The arguments of positive influence of decentralization consist of four different hypotheses: (1) the diversification hypothesis (aka decentralization theorem) (Oates 1972, 1977); (2) the Leviathan (restraint) hypothesis (Brennan and Buchanan 1980); (3) the productivity enhancement hypothesis (Martinez-Vasquez and McNab 2001); and (4) the political and administrative improvements hypothesis (e.g., improved accountability, decreased corruption, increased citizen participation) (Bird 2001). Therefore, our findings will be discussed and related to these four theoretical arguments.

The major point of the decentralization theorem is the fact that centrally determined policies do not consider either regional and local conditions or locally determined policies in the provision of public goods and services. Thus, Oates (1993) argues that the economic growth of a nation might be only enhanced if only subnational authorities are more actively involved in such policy decisions. In other words, a more involved subnational government will result in a higher economic growth rate. Our findings do not support this theoretical argument. In the sample under analysis, our well-developed index of decentralization was not a statistically significant explanatory variable of economic growth. Based on our sample analysis, we may safely say that the decentralization process does not have any statistically significant influence on economic growth. The implication of this finding is that the influence of decentralization might be either positive or negative in a bigger sample. However, given our results at this point, we may safely conclude that Oates' argument about decentralization needs further investigation. Also, this result means that we do not have objective evidence to support the argument presented by Martinez-Vasquez and McNab (2001) that "decentralized expenditures may cause greater 'consumer efficiency'" (p. 9), thus leading to a greater economic growth rate. The general conclusion at this point is that decentralization and economic growth rate are two separate phenomena that do not correlate and/or cause each other.

The second argument supporting decentralization is the "Leviathan (Restraint) Hypothesis" and stems from Buchanan's Theory of Clubs (1965) and Brennan and Buchanan (1980). The main point of this hypothesis is that intergovernmental competition may prevent an oversupply of public goods and services and/or x-inefficiency in the public sector. Thus, ceteris paribus, decentralization should have a positive impact on per capita growth due to more efficient use of resources by governments. Again, as in the case of the decentralization theorem, we do not have clear evidence that intergovernmental competition expressed through decentralization leads to a positive impact on economic growth.

The third argument supporting the benefits of decentralization is known as "productivity enhancement hypothesis." The main point of this hypothesis rests on the fact that decentralization implies a transfer of responsibility associated with accountability to subnational governments. Such a transfer of responsibility results in the fact that subnational governments have direct incentives to take into account local preferences. Additionally, this incentive suggests that local governments actively look for ways to improve their operations (Theissen 2000). As a result of the previously mentioned incentive, production costs and prices of public goods and services could thus be lower and their quality better than in a uniform approach to providing public goods and services. In other words, decentralization may result in greater producer efficiency (Martinez-Vasquez and McNab 2001), which would then contribute to an increased economic growth. There are two separate parts of this argument. The first part concerns producer efficiency gains expressed in an increased economic growth rate. Based on our results, we may safely say that even if there are gains in terms of efficiency, these gains do not contribute in a statistically significant manner to the economic growth rate of a nation.

The second part of this argument is about the quality of the services provided by subnational governments. The aspect of quality of public services was addressed through our index that accounted for quality of regulations. The implicit assumption here is that more decentralization implies higher quality of services rendered because of the proximity of governments to its constituents. This assumption is somewhat similar to the fourth argument for promotion of decentralization because of the theoretical benefits associated with it.

The fourth group of arguments supporting decentralization is political in essence. The political aspect of the decentralization argument is related to quality of governance. According to that group of arguments, decentralization puts distributional decision-making closer to the citizenry. The expectation is that local decision makers have better information about the problems and needs of their local area than do their

central counterparts. Additionally, accountability between governments and citizens is increased because of the proximity of governments to their constituents. This means that locally elected officials are more likely to be sensitive about local needs then their national counterparts. Finally, increased accountability is correlated with decreased corruption, thus, resulting in an increased social welfare. That may be the case, however, additional research that is well beyond the purposes of this article is needed.

This subsection has reviewed the evidence regarding arguments about decentralization's positive influence for a nation's economic growth. However, there are significant arguments cautioning against decentralization. Our findings will be interpreted through the prism of these arguments in the next section of this chapter.

### Discussion of Arguments Cautioning against Decentralization

As shown in the preceding part of this chapter, although the contribution of the decentralization process towards the economic growth of a nation is insignificant in our sample, this process still has some positive potential (in terms of quality of governance) associated with it. However, the discussion of our results would be incomplete without a proper analysis of the opposite stream of literature that warns of decentralization's dangers. The stream of cautionary literature was thoroughly presented by Morozov (2016, 2017), and it can broadly be summarized into two major groups according to its focus: (1) economic research and (2) public administration and political science research. The first group of literature is economic in nature. The economic cautionary notes against decentralization are (1) macrostability related arguments, (2) horizontal equity issues, and (3) a nation's size and level of economic development.

Tanzi (1995) suggests that decentralization may hinder long-run economic growth by making the task of stabilization more difficult when we interpret stabilization to mean not only countercyclical actions but especially the fiscal adjustments needed to eliminate structural (chronic) imbalances. This argument implies that the decentralization process has a statistically significant negative influence on economic growth. However, the evidence from our analysis suggests that decentralization is not a significant predictor of economic growth. In other words, we cannot unequivocally say that decentralization hinders economic growth. What we may say is that, based on our evidence, there is no relationship between the two processes. That might, however, change in a bigger sample.

Another aspect of the economic efficiency argument is based on the principle of horizontal equity and presented by Theissen (2003) and Prud'homme (1995), who suggest that the economic efficiency argument requires roughly similar regional fiscal capacities, which might not be the case in developing countries. Whether or not it is the case, different fiscal capacities of different subnational regions are aggregately reflected in the subnational participation in the economy. In other words, if the disparity of fiscal capacities among subnational units were indeed detrimental to the economic growth rate, that would then show in the results as a negative consequence of decentralization. In other words, the decentralization index would exhibit a negative and statistically significant influence on economic growth. As we previously described in our results chapter, the decentralization index does not influence the economic growth. Therefore, we may safely conclude that even though inter-regional disparity might influence the decentralization degree, it (decentralization) does not show up as a significant influence on the economic growth of a nation. This raises a possibly interesting question. We have examined the role of decentralization for a nation's economic growth rate. However, we did not examine the role of decentralization for subnational units' economic growth. Theoretically, the more control a subnational government has over its economy, the better the results could be (if everything is done properly). This topic represents a potentially fruitful area of future research.

The third type of economic argument against decentralization was developed by Bahl and Lihn (1992), Theissen (2000, 2003), and others. These arguments caution against decentralization in low-income and small countries. The main point

of these arguments is that the fixed costs of decentralization could consume such a large share of the total funds available that decentralization might seem difficult to justify (Prud'homme 1995). The implication of these arguments is twofold. The first is that the decentralization function in developed countries is different from that in developing countries. In other words, the decentralization function might be a nonlinear function, and the decentralization function slopes for developed and developing countries are different. We have explicitly tested both parts of that argument. Our findings indicate that the best decentralization function is linear. This finding addresses Bahl and Lihn's argument against the process under analysis. Specifically, we may safely say that the initial costs of decentralization are not as high as theorized by Bahl and Lihn. This is the case because subnational governments already exist in countries. Therefore, the fixed costs of the implementation of a decentralized governance system are sunk costs and, thus, are not relevant to the decentralization decision. However, these costs would be relevant if they had not yet been incurred. Additionally, the nonlinearity argument presented by Theissen (2003) suggests that there might be either too much or too little of decentralization. Theissen further theorizes that either situation is detrimental for economic growth. Our results indicate that (1) decentralization is best explained by linear function and (2) neither high nor low levels of decentralization have an influence on the economic growth of a nation. The second part of this argument is related to the fact that developed countries face different issues than do developing nations. Thus, the decentralization function would be different for each group. We have also explicitly tested this hypothesis and found that decentralization functions do not have different slopes for developed and developing countries. The differences of issues faced by different countries (as a function of their level of development) are nothing but changes *along* the decentralization function.

The second type of literature that cautions against decentralization stems from political science. As previously mentioned, the political aspect of decentralization is mainly about the quality of governance. Thus, arguments against decentralization revolve around this concept. As previously mentioned, the quality of governance was addressed via our comprehensive index. However, testing the influence of decentralization on the quality of governance is well beyond the purposes of this article.

D

## Significance of the Research and Concluding Remarks

In some ways, this research project has covered well-known ground. In other ways, new paths of research have been forged. Not only is there additional evidence on questions that have been pondered for a while, but also some new directions for research and policy have been identified. The effort to analyze and extend the existing framework of understanding of decentralization is important. While the basic thrust of decentralization arguments remains intact, some important qualifications have been added. Additionally, the conclusions about appropriate measures of decentralization are new and important. The significance of these measures of decentralization lies in the fact that for the first time a set of measures that would capture both economic and political-administrative has been proposed, carried out, and calculated. These measures of decentralization, while too blunt to be used for the specific analysis of a country, offer a meaningful way to compare progress in terms of decentralization all around the world. Additionally, these new decentralization measures were employed to answer the question of causality between decentralization and economic growth.

Multiple econometric procedures were employed by the author of this study to enhance the study's credibility. The first significant econometric contribution is the use of factor analysis in the development of decentralization indexes. This technique enabled a statistical answer to the question about the structure of a decentralization system. As such, this technique addresses the widest criticism of currently employed measures of decentralization. According to this criticism, currently employed measures of decentralization are not capturing the interconnected nature of decentralization because of their focus on the

economic side of the process. As such, the decentralization measurement then becomes misspecified. Such misspecification may potentially lead to inaccurate conclusions of negative influence of decentralization on economic growth rate, service delivery, and other aspects of public administration and economics.

The next most important econometric procedure that improves the credibility of this study is the use of pooled datasets. This approach avoids both the problems of aggregation bias under time series models and heterogeneity among units of observation under cross-section models. This method also gives much more efficient estimates and more reliable conclusions about statistical significance of the findings. Another important consideration is the use of a fixed effects model. The use of a fixed effects model captures the multitude and variety of the existing political, administrative, and economic arrangements in different countries. This is the appropriate methodology in this case because there might be multiple factors of influence on a country's type and mode of decentralization. Obviously, the method has costs associated with it. The loss is that some variation among different data points is lost as unknown. However, the benefits of this approach compensate for its costs through the higher quality of its estimates.

This study took extreme care to test for common and uncommon econometric problems. The test for multicolliniarity revealed no need for adjustment. Serial correlations as well as unit roots were not a problem. Variance inflation factors, albeit a little high for two variables in the economic growth model, were not a cause of bias or concern.

Many have argued that, if properly implemented, a decentralization system will contribute to a nation's economic growth. Others have warned against decentralization because of its potentially negative influences. The evidence of this research project shows that decentralization does not affect economic growth. The implication of this finding is that decentralization, if pursued, should be pursued for other reasons than the facilitation of economic growth. Thus, the findings here are all the more important for future technical consultancy to developing countries, their governments, and international donors.

Beyond practical reasons, these findings are also relevant and important for the theory. As previously analyzed, while there is no significant positive relationship between decentralization and economic growth of a nation, there might be a significant relationship between decentralization and the economic growth of subnational units of a country. This venue of research has received little attention from the academic community. Perhaps one of the most important reasons for this was the fact that there were no universally comparable measures of decentralization. With the newly proposed indexes, the lack of such tools should be rectified.

Two normative comments are required at this time. The first observation has already been made and will only be repeated once for additional emphasis. Decentralization is a multifacet process. This research reminds us that a systematic measurement of such multi-aspect processes requires great care in analysis and interpretation. Increasingly, new statistical indicators of various aspects of decentralization have become available. However, despite this, conceptual fogginess clouds our understanding of how to use these new indicators. As a result of such fogginess, a multitude of hypotheses can emerge, and a multitude of definitions can be developed. To organize what we know about decentralization so far, this research advances an explicitly empirical approach that uses conceptual dimensions to meaningfully organize data on decentralization. Such an approach may not work for all the concepts, especially these that defy neat categories and clear indicators. Additionally, techniques that measure variations, such as factor analysis, will work imperfectly if the empirical distribution of cases does not reflect the full range of a specific concept. However, a mutually understood and agreed upon set of concepts and definitions can allow researchers to either agree or disagree in a productive fashion and provide more consistent advice to policymakers regarding decentralization's mechanisms, its benefits, and its costs.

The second comment is more theoretical in nature. Despite all the research on decentralization, there is much that can be added to both policy and theory. This article has attempted to add to the body of knowledge on decentralization via the development of indexes that would capture the essence of decentralization. Subsequently, this manuscript explored the causal relationship between economic growth and decentralization. Future progress in the field of decentralization depends on both committed research on additional nations and many varied research approaches. Case studies on various countries and their decentralization schemes would allow us to develop better measurements of decentralization. Better measurements of decentralization would in turn be conducive to more accurate theories on the role of decentralization as well as more accurate policy recommendations to both developing and developed nations.

# Decentralization and Governance

Khandakar Farid Uddin
Center for Administrative Research and Innovation (CARI), University of Dhaka, Dhaka, Bangladesh

## Synonyms

Delegation and domination; Devolution and supremacy; Regionalization and ascendency; Reorganization and power

## Definition

Decentralization is the administrative reform to division and dissemination of central government authorities, activities, rights, and responsibilities to the distant grassroots administrative units. On the contrary, governance is the administrative innovation to ensure effective application of organizational arrangements and reforms. Both decentralization and governance are effective administrative tools to strengthen the management skill and delivery of services. Decentralized governance is usually introducing to support to democratic state-run, whole state affairs, grassroot governance, and better public services. Decentralized governance ensures

delegation of the power and authority to the remote level administration. They help to empower local level administrative wings and enhance the opportunity for active public participation. Decentralized governance is substantial in ensuring sound and sustainable governance.

## Introduction

Decentralization and governance are fundamental part of the government strategies to facilitate regulatory approaches. Governance is an ancient term, which has been applying by organizations to launch effectiveness and operative services. The various state faced significant socio-economic barriers to their governance problem. The governance practices have been changed with the passes of time. The traditional governance apparatuses were being shifted to collaborative manifold arrangements, and the shifts are theorized as decentralization (Bannink and Ossewaarde 2012). Decentralization is being widely supported as a means to overcome various problems (Faguet et al. 2014). Decentralization is applied as an instrument of governance actions around the world to establish efficient functioning of administrative machinery. Faguet (2014) claimed decentralization as the significant organizational changes. Subsequently, decentralization is the process of transferring reliable state power to the local bodies to ensure competitive services. Therefore, by considering administrative efficiency and better facilities, there are strong ties with governance and decentralization.

## Conceptual Framework

Scholars have defined the term decentralization and governance from numerous standpoints. Both concepts are related to competent administrative functionaries and better services to citizens. Usually, governance is the administration's ability to make and enforce rules capably and to deliver services smoothly to the citizen. Furthermore, governance is the process of exercising authority and consequences of various stakeholder's relations to manage its functions and to solve public issues of society, monetary, and policymaking (Saito 2008; Wahhab 2006). Governance is also considered as the government's regulatory power to initiate and impose strategies (Fukuyama 2013). Governance likewise acknowledges the people choices and incorporates them in the administrative process. Olowu and Wunsch (2004) demarcated governance as the progression of public decisions and implement the decisions. For smooth regulatory activity and service delivery, there is need of shift the governance process. The transformation of typical governance process to corporate governance is considered as decentralization (Bannink and Ossewaarde 2012). Therefore, decentralization is regarded as the whole kit and caboodle as an advocate to improve governance. Ancient state to modern state decentralization is being applied fundamentally all over the world (Faguet 2014). Bannink and Ossewaarde (2012) argue that decentralization is the standard dimensions between the central and devolved points of governance assemblage. Sometimes decentralization is being applied to convince people in favor of the government. Decentralization makes governments more honest and efficient (Dreher 2006); therefore, the central government place decentralization into exercise to reestablish the assurance of the people in the state (Aoki 2008). Decentralization is fortified with many characteristics by its virtue.

## Key Features

Decentralization is the crucial process of administration for its broad application in the considerable amount of countries and profound consequences on the way to governance (Faguet 2014). It is extensively admired as a critical component of good governance and growth (White 2011). Thus, decentralization is equipped with various characteristics. Some of the noteworthy features are described below,

***Governance origination***: Decentralization opens broad avenues for governance. Decentralization

ensures people participation, accountability and transparency and eradicates autocracy and supremacy of the central government which instigates the progression of governance.

***Triggering local government***: Decentralization strengthens the local government system by delegating power to the local authorities. The grassroots people receive the opportunities of contribution in the governance system.

***Utilizing local resources***: The faraway resources of a country remain unexploited because of administration backing. Decentralization creates the opportunities for using the local resources of a nation.

***Contribute in the administrative matrix***: By the benefit of decentralization, the local level officials and grassroots and people get the opportunity to contribute to the organizational activities of the country.

***Organizational management***: Decentralization improves the managerial activities by regionalizing and delegating authority and responsibility. Decentralization removes the regulatory barriers to governance.

***Communication with the remote area***: The central and local administration can communicate quickly and frequently by the support of decentralization of government. The effective communication leads to better administrative and service governance.

## Importance

Decentralization is very dynamic component among other features of governance arrangements, and it diminishes the autonomy of the state (Bardhan 2002; Faguet et al. 2014). Decentralization is being applied in various regions for diverse purposes like to impose or restore political and economic control, to strengthen the democratic system, to minimize conflict or controversies, to expand the public facilities, or to aggravate regional dissimilarities (Ahmad et al. 2005; Streeten 1999). For their distance with the local level, the central government might not have satisfactory acquaintance with the remote localities; thus, decentralization is introduced in many states (Wahhab 2006).

Similarly, decentralization of government bodies makes central government more responsive to local needs and deliver inaccessible residents voice in public concerns. Faguet (2014) argues that decentralization incline reform the bureaucratic, top-down management system to a self-autonomies participatory system. Thus, decentralization fortifies democratic practice, enhance community involvement, and consequently improve government effectiveness. Accordingly, decentralization empowers citizens to ensure their interests articulated in the government strategy and amenities (Faguet et al. 2014). Regionalization of power unlocks the political participation of the community in policymaking. Furthermore, devolution of the administrative system by decentralization promotes equality, ensures cost-effectiveness, improves accountability, reduces corruption, and establishes effective governance. Bardhan (2002) argues that decentralization not the only purpose of the delegation of authority, it also substantially ensures governance at the local level. By delegating power and resources to lower levels of government, decentralization minimizes social tensions and community resentment.

## The Nexus Between Decentralization and Governance

Decentralization and governance are commonly considered as closely related (Saito 2008). The principle aims of governments are to manage the state affairs well and deliver efficient services to the citizen. Subsequently, the term governance is introduced to strengthen the government endeavors. Decentralized governance context is very operative in firming the state (Faguet et al. 2014). The centralized system of public administration is unable to ensure the level and quality of community services to the periphery. On the contrary, the decentralized administrative local bodies despite having limitations are firmly engaged with the desires of the people. Bardhan (2002) claims that decentralization introduces "checks and balances" in the government structure (p. 185). Therefore, this administrative

adjustment helps to strengthen the governance mechanisms.

In this regard, governance attempt to progress the excellence in government functions and ensure smooth access to public services. The governance framework needs to function its activities with the supportive government bodies at the local level. The transformation of government philosophies to governance suggests that government inclined to be a top-down process and in contrast governance is the bottom-up process where various actors are actively involved in the operations (Saito 2008). However, the public participation and transparency are distinctive for the sound governance of government activities. Usually, the ruling classes were not used to incorporating publics in the organizational functionaries, or not even considered the thoughts and expectations of the public. The establishment of good governance is not possible without the active and fruitful involvement of publics in the government functionaries. Decentralization unlocks the opportunities for public participation in the governance progression. There was no widespread exercise of collaboration between the local public and government organizations before decentralization.

Decentralization is the spreading of the thought of governance at the local level that leads to accomplishing the national level of governance well. Concerning governance, Azfar et al. (1999) alleged decentralization by way of "bring government closer to the people" (p. 1). The governance aims to destroy strictness and introduce candidness of the government activities. However, theoretically, decentralization is strongly preferred to enhance the accountability and openness of the government (Faguet 2014). Decentralization contributes to fortify the swiftness of governance agendas and in this means decentralization and governance are strongly associated with each other. Accordingly, the core output of decentralization is the substantive change in governance arrangements. Thus, the fruitful application of decentralization and governance mechanism requires a favorable circumstantial to implement their reform measures.

## Decentralized Governance Practices

Decentralized governance lessens strains of the central government, grows local level capacities, encourages divergence, and improves self-governing ethics. Decentralized governance is ensured by various means in different regions as per the practical situation. It can be practiced by relocating of central government authority and responsibility of planning, managing, fund mobilization, resource distribution, and policy implementation to the ground units. Various countries are applying various forms of decentralization to enhance the governance process.

The administrations are commonly applying de-concentration, delegation, devolution, and dispersal to establish hands-on and responsible decentralized governance practices around the entire organizational apparatuses. In the de-concentration decentralization method, central administration transfers the management workload and specific responsibilities from central officials to local officials at the local level. However, the final authority kept in the center. De-concentration can be labeled as administrative decentralization in an arrangement of an introduction of field administration. Then delegation is another process of decentralization where central authority transfers power and responsibility to the bottom authority; however, final responsibility remains with the central authority. Devolution is also the process of decentralized governance where the central authority transfers legal authority to the locally established bodies. These bodies are free from the direct control of the central authority and work independently. It is fundamentally the self-governing and democratic decentralization process. Thus, the establishment of local government units is considered as the process of decentralization under the essence of devolution. Dispersal is another form of decentralization where the central administration engages administrators in the local area, but in this process, the central administration does not transfer considerable authorities and responsibilities to the local units.

On the other hand, the forms of decentralized governance depend on a range of factors like size

of the state, constitution, politics, leadership, the form of government, economy, the geography of functional areas, administrative ability, communication system, central-local relations. Consequently, decentralized governance practices elasticities substantial role to the localized bodies to adopt and implement own development program as well as assure sound management of state affairs as local actors are more well informed about their aptitude and hindrances.

## Decentralized Governance Challenges

The decentralized governance process brought economic, social, and political modifications to exaggerate localized contribution. However, there are substantial challenges in the progression of decentralized governance. Some of the vigorous challenges are informed below,

***Politicized governance***: Decentralized governance is controlled by the political government bodies. In the politicized organization, the political staff (ministers and public servants) give importance to partisan benefits in all endeavors (Aucoin 2012).

***Centralization of power***: The central management keep the authority and power in their custody; they are not willing to hand over the supremacy. The decentralized governance aims to transfer authority and power to the grassroots level, but the central authority creates obstacles in this progression. Due to the extreme centralization of power, almost all decentralized bodies face severe difficulties.

***Biased administration***: The central organizational units are influenced by the central leaders and not cooperative to the localized units. The localized units do not get the necessary support to accomplish their purpose of facilitating localized units. Decentralization goals are not being steered properly due to partial and incapable administration.

***Underprivileged local units***: A powerful and effective local units are essential for strong decentralized governance. Decentralized bodies' technical skills and competence on the ground are awkward. Indeed, the decentralized local bodies are neglected by the central authorities. A minimum number of skills are required to implement localized agendas, and decentralized institutions cannot manage the delegated functions.

***Political instability***: In general, the political parties have a hostile and antagonistic relationship. Decentralized governance is a political initiative, and the unstable political situation produces complications in the progression of decentralization and governance.

## Aspects that Strengthen the Decentralization and Governance Measures

The decentralized local bodies are subordinated to the government, which restrict the empowerment of the dispersed forms. A range of elements influences the process of decentralization and governance aspects. Decentralization improves governance (Dreher 2006); nevertheless, it requires considerable modification to improve governance (Ahmad and Brosio 2006). There are several aspects like location, population, resources, financial ability, central government command, constitutional authority, public participation, public consciousness, common characteristics, the rule of law, and lots of features that move the establishment of governance as well as decentralization. Among these issues, the substantial aspects are described below.

***Legal framework***: To ensure the reliable power and to fortify the benefits of decentralization, considerable authority should be definite in the constitution. Besides, the constructive law should be introduced to robust the legal base of decentralized governance.

***Administrative command***: The central government dictation to the decentralized local bodies significantly influences the structural decentralization. The central government empowers decentralized local government units. It is not possible to establish robust governance framework for the effective administrative regulator.

***Political authority and independence***: The decision-making power should be devolved to the local bodies. The restrictions of the politically free domain confine the regional administrations to implement strategies.

***Resources devolution***: The transfer of various resources like the institutional outline, managerial responsibilities, financial backing, political control, and democratic practice significantly stimulates the governance and decentralization process. Besides, the conditions of the resources being transferred, and the goals also affect the progress of governance and decentralization.

***Monetary supremacies***: The powers to levy local taxes, impose fees for services, management of revenue accounts, and sufficient fund from the central government impact the development of delegation and ascendency.

***Accountability***: The mechanisms for ensuring local officials accountable effect the decentralization process. To establish a sound governance framework, the local officials should be responsible for their decisions and finances to the central government as well as the public.

***Democratic features***: A constructive democratic situation is necessarily required for effective governance and decentralization. The accessibility of the rule of law, freedom of speech, equality, and justice is significantly crucial.

***The capacity of the community***: The aptitude of the public consciousness, literacy, patriotism, and responsibilities can also affect governance and decentralization. For stable formation of governance and decentralization conscious, responsible and hardworking nationals are necessary.

***Demographics***: Numerous demographic aspects like population density, the deficiency, income, social conflict, and economic conditions may also impact decentralization strategies.

As discussed above, there are various dominant aspects that shape decentralization and its impact on governance. Thus, if these characters are in the favorable situation, at that point decentralization can ensure better governance. The aspects of decentralization should be facilitated to strengthen the governance framework otherwise the effective administrative functions and better services for citizens will be far away.

## Conclusion

Decentralization is applied to broaden and strengthen the governance procedures. Decentralization strategies cannot be implemented if there is the insufficiency of facilities at the local level. It is a fact that in the decentralization process governments think that they would lose power, authority, and supremacy if they execute real decentralization (Ayee 2008). Also, the decentralized unit competence level is not up to the mark to implement the strategies. A minimum level of abilities is essential to achieve policies and agendas. However, the limitations depend on how seriously the central government initiates the solutions. On the contrary, decentralization may lead to severe governance. It may engender patron-client political relation between central and local government, which may lead to misuse of power (Golooba-Mutebi 2008). The competent and appropriate decentralized governance is called good governance. Though there are significant obstacles and criticisms in the process of decentralized governance, administrative decentralization is considered as a critical element aspect of governance arrangements. However, decentralization alone cannot generate useful governance. Other aspects of governance measures should also be ensured. Thus, the outcome of decentralization, even in the early stage, may lead to targeted consequences. The central administration should comprise and support the local people benefits by decentralized governance. For an ideal and effective decentralized organizational management, the decentralization processes must ensure effective and sustainable transference of authorities and dictates from the center to the local levels.

## Definitions

| | |
|---|---|
| Decentralization | The process of spreading out authority from a smaller to a |

| | |
|---|---|
| | larger number of actors and from a central authority to a less central authority. |
| Recentralization | The process of undoing or taking steps from decentralization towards centralization. |
| Disaster governance | The specific arrangements that societies put in place to manage their disasters and disaster risks within the broader context of governance. |

## Introduction

There is a belief that decentralized disaster management systems are better equipped to effectively prepare for and respond to disasters compared to more centralized systems. The superiority of decentralized disaster management systems may seem commonsensical since local actors are first on site when a disaster has struck. The activities of local (as opposed to central) governments and nongovernmental actors are also believed to facilitate risk management solutions that are adapted to the specific context as well as the needs and capabilities of local communities (Garschagen 2015). It is thus perhaps no surprise that advocacy for decentralization and empowering of local authorities is a centerpiece in mainstream disaster risk reduction paradigms (United Nations International Strategy for Disaster Risk Reduction 2005, 2015). Our knowledge about how decentralizing reforms play out in various disaster management systems is, however, not on par with policy circles' advocacy for it.

Yet, the wider decentralization literature informs us that investigating states' central–local relations helps us understand the consequences of decentralization (Hutchcroft 2001). Moreover, the nature of these relations also provides insight into how actors in any given system context perceive and receive decentralizing reforms. Central–local relations are also critical for managing disasters as such extreme events often overwhelm local authorities and call for assistance from the central national levels. This is one of the reasons for why effective management of disasters requires collaboration between central and local actors. Yet such collaboration does not follow automatically from decentralization reforms, despite their hypothesized effects of encouraging the inclusion of local perspectives and actors.

The wider decentralization literature has also established that lest the decentralization efforts are properly planned and implemented, they may bring unforeseen effects, including recentralizing backlashes. To be properly implemented, decentralization attempts must be carefully attuned to "the preexisting character of central-local ties" (Hutchcroft 2001, p. 46). Proper implementation of decentralization reforms also depends largely on political culture that manifests itself in the nature of state–society relations and decision-making structures (Garschagen 2015). The character of central-local relations, political culture, state-society relations, and decision-making structures largely stem from the character of a country's political and administrative system. One study even noted that the characteristics of states' political and administrative systems were what "most significantly influenced what was possible in terms of the scope, process, and speed of reform" (Sozen and Shaw 2002). The desired traits of decentralization and collaboration, as conveyed by the international disaster risk reduction discourse, are rarely present in the system setup of countries that are repeatedly hit by natural disasters. Instead, these countries are often rather centralized and hierarchical: Turkey, a country frequently hit by floods, earthquakes, and landslides, is a case in point. To manage the consequences of such extreme events in a more effective manner, Turkey attempted to decentralize their disaster management system a decade ago, but before long, the contours of a recentralizing backlash were noticed. Before getting more acquainted with Turkey and how this turn of events came to pass, the decentralization concept and some observed benefits and drawbacks related to decentralizing reforms and their implementation will be outlined below.

## The Decentralization Concept

In general, decentralization implies that authority is "spread out from a smaller to a larger number of actors" and from a central authority to a less central authority (Pollitt 2005, p. 373). Decentralization can be administrative, political, and fiscal. Administrative decentralization entails the delegation of responsibility for certain issues to local branches that are appointed by the central government. Political decentralization brings more independence to local authorities as it not only involves the delegation of power but also the devolution of exclusive authority. Importantly, these local authorities are not appointed but elected, and they are hence accountable to the electorate. Fiscal decentralization involves to what extent lower tiers of the government can "define their own tax bases, set their own tax rates, and determine their own public spending" (Treisman 2007, p. 25).

## Potential Benefits and Drawbacks of Decentralization

Research on decentralization reforms have identified a number of potential benefits and drawbacks of administrative and political decentralization. Public sector efficiency is one benefit. Administrative decentralization reduces information overload which may speed up decision-making, which in turn, may boost innovation. Local decision-making is also associated with being more responsive to citizens' specific needs and with reducing central governments' political intervention in local matters, which may reduce political tension (Pollitt 2005). Administrative decentralization may also improve employee motivation by making the results of employees' efforts more visible as opposed to "just being a cog" in a large centralized bureaucracy (Haase and Antoun 2015). Turning to political decentralization, its promoters propose that it brings political power closer to citizens and makes politicians less remote and more accountable. It may also increase participation, both during and between elections.

Decentralization reforms can clearly also have negative effects. For example, it makes it more difficult to retain a critical mass of experts and it also increases fragmentation, which challenges efficient coordination of policies and programs. Also, having autonomous local authorities may increase the likelihood of citizens receiving unequal treatment, which can cause increased ethnical or political tension (Pollitt 2005). Decentralization further brings more intricate accountability systems, which may create opportunities for blame shifting and/or avoidance. These downsides shed some light on why natural resource management and public service delivery researchers point out that we are amiss if we equate decentralization with more effective service delivery (Bardhan 2002; Hutchcroft 2001; Jesse et al. 2006; Rumbach 2015).

Within the disaster and emergency literature, a rich body of research has developed arguing the benefits and drawbacks of placing the main burden for managing crises and disasters centrally, regionally, locally, or a combination of the three which is often the case. Against this background, many studies also discuss intergovernmental coordination between these levels and various jurisdictions, which is crucial for disaster management. More specifically, researchers have also looked into how decentralized structures impact certain aspects of disaster response, like information flow (Koehler et al. 2014) and evacuation (Waugh and Ruback 2014). Studies like the ones just mentioned often study disaster management systems already in place while this chapter is more concerned with the reaction to, and the dynamics of, the decentralization process(es) itself.

As mentioned above, the potential of decentralization reforms is hypothesized to depend on the institutional context and the political culture and circumstances in which they are embedded "Bureaucratic Culture". Critical aspects to ponder before attempting to decentralize are whether local jurisdictions have the needed capacity and financial resources and whether they are prepared to assume the responsibilities handed to them (Haase and Antoun 2015; Jesse et al. 2006). Other relevant context features include the

strength of monitoring and accounting systems and accountability mechanisms (Bardhan 2002). Initiating decentralization reforms without the presence of these conditions may lead to problems occurring locally and when (rather than if) central governments undertake countermeasures to address these problems, a recentralization "backlash" often follow. Ineffective and/or dysfunctional decentralization processes have been observed in a variety of political-administrative system contexts, like the Middle East (Haase and Antoun 2015), South Asia, West Africa (Agrawal and Ribot 1999), and Latin America (Jesse et al. 2006). In addition to the conditions already mentioned, Rumbach (2015) notes that within the disaster management sector, gaps between de jure and de facto decentralization may affect the feasibility of such reforms. Such gaps often emerge when decentralization initiatives are launched by central governments to appease international donor agencies or domestic constituents without being willing to cede power.

Turning back to Turkey, it has long been emphasized that the Turkish disaster management system needs stronger local actors and more collaboration between actors (Ganapati 2008; Kapucu 2012; Unlu et al. 2010). Steps were actually taken towards realizing both as decentralization reforms were initiated following unprecedented earthquakes in 1999. The development was partly spurred by the international aid organizations involved in the restructuring of the disaster management system. Yet, despite initiating decentralizing reforms during the decade that followed the 1999 earthquakes, the de facto development of the disaster management system has taken a centralizing turn, particularly so in the wake of new earthquakes in 2011. How could this come to pass?

## Central Governments May Delimit Decentralization

Studying decentralization reform within the forestry sector, Jesse et al. (2006) showed that central governments use a number of strategies to thwart or limit decentralization processes. One strategy is to introduce new systems of oversight in the wake of decentralization, which reduces local authorities' newfound autonomy. Another strategy is to not match local authorities' increased responsibility with increased funds, which makes it hard to fulfill their newfound responsibilities. Both strategies were present in Turkey's recentralization process. First, attention is given to how the central government introduced new systems of oversight.

### Introducing New Systems of Oversight

One major change in Turkey's disaster management system following the earthquakes in 1999 was that the Disaster and Emergency Management Presidency (AFAD) was created. This is a central agency, placed in the Prime Ministry, but in addition to its headquarters (HQ) in Ankara, provincial and regional AFAD offices were also created with provincial managers to strengthen local authorities. At the outset, in 2009, when AFAD was created, these local offices were attached to the provincial governor which entails a decentralizing move. Yet, following the experiences made from dealing with new earthquakes in 2011, centralizing changes were made in AFAD's organization. The changes tied AFAD's provincial offices closer to the HQ in Ankara (act 6525; AFAD 2015) by altering how AFAD's local managers are appointed. AFAD's local managers are still responsible to the provincial governors in day-to-day activities, but the governors no longer appoint them – AFAD's president and the deputy prime ministers do. On the one hand, this may allow for appointing officials who are loyal to the current central perspectives, perspectives that often diverge from local ones as actors at different levels in a system not necessarily share understanding or priorities. On the other hand, centralizing appointment procedures may reduce the risk of basing appointments on local partisan pressures. Favoritism is widespread in the Turkish political-administrative system, both at central and local levels (Çaha 2009; Kalayçıoğlu 2001).

In addition to changing this appointment procedure, the budget procedure was also changed. Previously, the activities of the local AFAD offices was covered by the provincial governors' budget. Since the change, the local AFAD offices

instead come under central AFAD's budget. As it is commonly difficult for local officials to motivate the spending of money on disaster preparedness (unless a disaster has recently happened), centralizing the budget for such activities may ensure that initiated capacity development projects are carried out and not postponed due to other competing local issues. On the other hand, provincial governors generally have a superior knowledge of local conditions and the type of preparedness activities that are most needed. Regardless of whether the changes bring better or worse outcomes; centralizing the power to decide over local appointments and spending not only entails introducing new systems of oversight. The changes go further than that as they clearly restrict local authorities' room to maneuver and thwarts the decentralization process.

Another aspect related to moving beyond the introduction of new oversight systems is the character of AFAD's mandate. Its location within the Prime Ministry would normally grant them a regulation and coordination mandate. In the Turkish administrative system, implementation mandates reside with the general directorates within the other ministries. AFAD has, however, gradually become involved hands-on in disaster management operations and has, in practice, been bestowed with an implementing mandate. AFAD has thus moved away from oversight, engaging merely with policy and planning, to also conduct operative activities. This shift may be understandable given the currently low disaster management capacity locally (Unlu et al. 2010), but regardless, the development in itself entails a further centralization of the disaster management system.

### Mismatch Between Responsibilities and Funds

The central government may also thwart decentralization reforms by withholding funding to local levels ▶ "Local Governments and Crisis Management". It is noteworthy that following the devastating earthquakes in 1999, nearly every type of local authority (including municipalities) existing at the time saw an increase in their power, duties, and responsibilities related to disasters (Balamir 2013; Gül and Kiriş 2015). According to a report from the Turkish Ministry of Public Works and Settlements (2009), the increase in local authorities' tasks and responsibilities meant that "most of the [disaster] mitigation, preparedness, planning, and recovery works have been transferred to them" (p. 7). There was indeed a serious decentralization attempt – on paper. Yet changing responsibilities on paper does not change capacity, especially not when central governments increase responsibilities without coupling it with increased financial and human resources. Fiscal decentralization generally remains very limited in Turkey (EU 2014). Turkish disaster laws put a lot of responsibility on governors and municipalities but the capacity to manage disaster on these levels is low and adequate funds to be able to raise their capacity have not been provided. Having interviewed local actors in Van and Erciş that was struck by earthquakes in 2011, it became clear that the initial conditions needed for decentralization to succeed was lacking: interviewees, for example, mentioned feeling unprepared and incapable of assuming the responsibility handed over to them due to various capacity deficits. This is part of the so important conditions in the institutional context that must be considered before initiating, or advocating for, decentralization. Although some local authorities expressed the wish to be relieved of their current responsibilities, there was no unanimous desire to recentralize the system. Rather, some envisioned placing the responsibility for disaster management at the regional level, where knowledge and understanding concerning local conditions, which they considered very important, are more prevalent than at the central level.

### Low Levels of Central-Local Collaboration

In addition to central actors' introduction of new systems of oversight and withholding of funds to local levels, recent research suggests that central actors' refraining from collaborating with local actors may also shed some light on the fate of decentralization reforms (Hermansson 2018) ▶ "Collaboration in Crisis Management". Local disaster management capacity in Turkey not only suffers from inappropriate funds but also from

weak relations between central and local actors. An AFAD (2015) report mentions that the central–local relations must be improved as they strengthen the capacity of the responsible local agencies. Weak relations between central and local actors is problematic as it may contribute to that the proposed benefits of decentralized disaster management never see the light of day. Decentralization is, for example, hypothesized to increase local disaster governance capacity (Rumbach 2015), local participation, and incorporation of local knowledge in disaster planning (Escaleras and Register 2012). But these goals or preferred end states will be very difficult to attain, and maintain, without central-local collaboration. The management of the 2011 earthquakes in Van and Erciş, proffered many manifestations of weak central-local ties (even though some collaboration occurred thanks to individual initiatives, see Hermansson 2019). Interviewed key actors painted a picture of a disjointed political-administrative and disaster management system where local actors had a hard time getting the attention of AFAD to share their experiences and lessons learned. The disaster management system was also described as being very low in community and local authority participation. There was also a revealing distance between local and central actors' perceptions and interpretations of events connected to managing the earthquake. One example concerns local and central actors' perceptions of the earthquake response that were described as being "worlds apart, with one version describing quick and adept disaster response and the other suggesting that Turkey has a long way to go in terms of disaster management" (Ayasun 2011).

Another example concerns the planning and building of new residential areas following the earthquakes. The legislation surrounding earthquake reconstruction was modified in 2011 so that the previous decentralization of housing and urban planning issues was abolished and the issues related to urban renewal and land-use planning were recentralized (Balamir 2013; EU 2012). A provincial official shared that as result; everything concerning the new residential areas was decided by "Ankara," by people at the central level who were not familiar with the local conditions. Local actors felt excluded from the process and saw the implementation of these projects as far from ideal (Hermansson 2018). The new apartments were, for example, not adapted to local needs and residents' access to labor and social arenas became limited (Tercan 2015). An AFAD HQ report, however, conveys that the reconstruction of Van is a "best practice" that currently serves as a model for the future. When central actors dominate both the rebuilding processes and the post-disaster narratives in this manner, central perspectives are regenerated and central-local gaps reified. Considering AFAD's current implementing mandate and the lack of local actor participation in disaster management, their (central) voice becomes even stronger. In such an environment, decentralizing reforms do very little in terms of increasing local disaster governance capacity, local participation, and incorporation of local knowledge in various planning processes related to disaster.

## Conclusion

Following the lessons made from unprecedented earthquakes in 1999, a stepwise decentralization of the disaster management system was initiated in Turkey. Nearly all types of local authorities existing at the time were given more power and responsibilities, but in spite of this, recent developments indicate that a recentralization process is in the making. Decentralization research suggests that decentralization reforms risk being for naught if trying to implement them without proper preparations and starting conditions. In these instances, central governments who are often reluctant to give up power, find ways to circumscribe local actors' newfound authority and responsibility. They may, for example, as in the case of Turkish disaster management, retort by introducing new oversight mechanisms, omitting to match local authorities' increased responsibilities with increased funds, and/or avoiding to include and engage local actors in collaboration. These types of strategies are often enabled by highly hierarchical and centralized political-administrative systems, like the Turkish one, and

the political-administrative culture that they tend to give rise to. This awareness of how political-administrative contexts shape and color the potential for decentralization needs to be incorporated into the knowledge foundation that current disaster policy and advocacy is based on. Otherwise, what may come across like steps towards achieving a decentralized disaster management system, may be little more than the first step of a recentralizing process, in which the system returns to an even more centralized state than before.

Administrative decentralization; Decentralization; Deconcentration; Delegation; Devolution

### Introduction

Decentralization is defined as the reorganization or transfer of power and authority away from central governments toward regional and local actors (Pollitt 2005). In the Republic of Lebanon, advocates for political and administrative reform have long argued that decentralization would expand local participation and strengthen national unity. The foundations for this argument can be traced back to the mid-nineteenth century, when the Ottoman Empire began to establish local municipalities throughout what would become modern-day Lebanon. During the 1920s and 1930s, French mandate authorities continued this trend and expanded the number of municipalities (Favier 2001). After gaining independence in 1943, the Lebanese government began to decentralize political and administrative authority toward local municipalities. The Lebanese Civil War (1975–1990) weakened Lebanon's political and administrative systems and disrupted these municipal reform efforts. Discussions about decentralization began anew with the adoption of the Ta'if Agreement in 1989, which brought the Lebanese Civil War to a tenuous close. The Ta'if Agreement (1989) stressed that administrative decentralization would contribute to national reconciliation, local participation, and economic and social development. Despite the promotion of decentralization as a mechanism for peace and stability, Lebanon's administrative power and authority remain concentrated within the central government.

This entry reviews developments associated with administrative decentralization within Lebanon after the conclusion of the Lebanese Civil War. It begins with an overview of the evolution of Lebanon's administrative structures during the 100-year period that preceded independence. The discussion then shifts toward Lebanon's contemporary administrative structures, concentrating on both their institutional arrangements and their governance problems. The entry then highlights the recommendations contained in a major legislative proposal that focused on the decentralization of power and authority from the central government toward regional and local governments. Although commissioned by Prime Minister Najib Mikati and endorsed by President Michel Sleiman, the draft legislation has not been submitted to the government for approval, hindering the aspirations behind the proposed reforms. This entry concludes by highlighting the administrative and political obstacles that hinder Lebanon's ability to embrace decentralization.

## History of Lebanon's Administrative Structures (1861–1977)

Lebanon's contemporary administrative structures date to 1861, when following a conflict between Christians and Druze, the Ottoman Empire established the administrative region of Mount Lebanon. This administrative region, known officially as a Mutasarrifiyya, was placed under the authority of the mutasarrif, an Ottoman government official appointed by the Sultan. In an attempt to maintain their control over Lebanon, the Ottomans reorganized Lebanon's territory into seven districts (qada's), which were administered by an officer (qa'immaqam) who was appointed and overseen by the mutasarrif (Antoun 1995). Each district was subdivided into directorates (mudiriyyat), which were administered by directors (mudir) who were appointed and overseen by the qa'immaqam. The smallest administrative unit was the village, headed by a shaykh or a mukhtar, who was selected through local elections. After a period of rapid population growth and urbanization, the Ottoman Parliament promulgated the Municipal Law of 1877. This law established a modern form of municipal government and required all towns and cities to form municipal councils. This law also expanded municipal authority to include social services, public works, health, and sanitation. To maintain their control over municipal affairs, the Ottoman government appointed mayors and various members of the municipal councils.

After the collapse of the Ottoman Empire, Lebanon came under the purview of the French Mandate. The French adjusted Lebanon's political and administrative structures in 1920 and reorganized the territory into 11 regions (muhafazat), each headed by a muhafiz. The regions were further subdivided into directorates (mudiriyyat), each headed by a mudir. This arrangement was short-lived, however, as the territory was subsequently recentralized into five regions (muhafazat), which were subdivided into districts (qada's) and administered by an officer (qa 'immaqam). The French also adopted a new municipal law in 1922. While this law worked within the general framework of the Municipal Law of 1877, it redirected power and authority back to the central government. In addition, municipal council membership was expanded to include ex officio members such as the muhafiz, the qa'immaqam, and French counselors. Within this revised structure, the municipal council president, appointed for a 1-year term by the central government from among the council members, served as both the mayor and the agent of the central government. As a consequence of these reforms, municipal councils were left with little more than nominal power.

The Lebanese government, after independence, elected to retain the Ottoman and French models of administrative centralization. The first modification of the municipal laws, promulgated in 1947, specified the conditions under which municipalities could be created and established the rules that governed the management of municipal councils. Over the next 50 years, the Lebanese government amended the municipal laws nine times. These amendments not only adjusted the conditions under which municipalities could be established, they also adjusted how municipalities could manage their internal affairs (Mrad 1997). With the promulgation of Decree-Law 116 of 1959, however, Lebanon's central government initiated the formal deconcentration of administrative authority toward the muhafazat and the qada's. These reform processes continued until the adoption of the Municipal Law of 1977, the legal framework that governs Lebanon's municipalities today (Decree 118 1977).

## Contemporary Administrative Structures (1977–Present)

Lebanon's contemporary administrative structures are organized into four levels (Decree 11 1988). These structures, as indicated in Fig. 1, include the central level, the regional level (muhafaza, led by a muhafiz), the district level (qada', led by a qa'immaqam), and the local or municipal level (baladiyyat, led by a mayor). At the regional level, Lebanon is organized into eight

**Decentralization in Lebanon, Fig. 1** Levels of deconcentration and decentralization in Lebanon

muhafazat, which include Beirut, Mount Lebanon, North Lebanon, Akkar, Baalbek-Hermel, Beqaa, South Lebanon, and Nabatiyyeh. At the district level, including Beirut, Lebanon is organized into 26 qada's. At the local level, Lebanon's villages, towns, and cities are organized into more than 1,000 separate municipalities. In terms of the division of administrative power and authority, regions and districts represent levels of deconcentration and, as such, implement the policies and directives of the central government. In contrast, municipalities represent levels of decentralization and have the statutory authority to govern their affairs through autonomously elected bodies. Despite this institutional distinction, regions, districts, and municipalities all fall under the control of the central government's Ministry of Interior and Municipalities (MoIM).

The responsibilities of Lebanon's regions and districts are predominantly administrative, as they do not possess any legal personality or independent authority. At the regional level, the duties of the muhafiz involve the local implementation of policies established by the central government. The muhafiz also coordinates with the central government offices and officials in the region. The muhafiz is assisted by a council (except in Beirut), an advisory body composed of all the qa'immaqam in the region, a financial officer, and two civil society representatives from each district, who are appointed by a decree from the Council of Ministers. Although the law requires the establishment of these councils, they have not been formed in any of Lebanon's muhafazat. At the district level, the duties of the qa'immaqam are similar to the duties of a muhafiz, except they do not represent or coordinate the central government ministries and offices. Although Lebanon's territory is organized into 26 districts, 5 districts are classified as regional capitals and are administered directly by a muhafiz.

Lebanon's local administrative matters are governed by the Municipal Law of 1977, which established the legal and financial authority of Lebanese municipalities. According to the Municipal Law of 1977, all Lebanese cities, towns, and villages are permitted to have a municipal authority, provided that their population exceeds 300 persons and their annual revenues reach a minimum threshold (Decree 118 1977). The legal responsibilities of municipalities have been broadly defined to include "all actions of a public nature or with a public interest within the municipal boundary" (Decree 118 1977, Article 47). Matters of local governance are handled by the municipal president (mayor) and a municipal council, the size of which is determined by the size of the authority's registered population. All elected municipal officials serve 6-year terms, except in Beirut, where executive authority is possessed by the muhafiz. Municipalities also have the authority to form municipal unions, which can promote municipal cooperation on projects of public interest, for example, large-scale technical projects that benefit their member municipalities.

To finance their operations, Lebanese municipalities have the authority to access seven different sources of revenue, of which three are the most important. The first is direct revenue, which, according to Lebanese law, can be generated by

36 different tariffs and fees (Law 60 1988). Only three of these fees are financially significant: those on the rental value of built real estate, those on construction permits, and those on sewerage and pavement maintenance. The second source is derived from VAT taxes and service surcharges collected by public, semipublic, or private organizations. The third source comes from the Independent Municipal Fund (IMF), an intergovernmental grant system that redistributes tax and fee revenues from the central government to the municipalities and municipal unions. These revenues are disbursed by decree following the recommendation of the MoIM. The MoIM uses a formula established by law, which requires 60% of the distribution to be based on the registered population and 40% to be based on the actual direct revenues collected during the previous 2 years (Decree 1917 1979).

## Problems with Lebanon's Contemporary Administrative Structures

Discussions about Lebanon's administrative structures are contentious. Those in support of the status quo argue that these structures enable the central authorities to preserve one of the oldest democracies in the Middle East. Others argue that these structures deny local communities the opportunity to participate in decision-making and impede Lebanon's social and economic development. Notwithstanding the significance of this debate, there are four problems that undermine the effectiveness of Lebanon's contemporary administrative structures.

### Central Control

The first problem is that municipalities do not have the autonomy to manage their internal affairs. The Municipal Act of 1977 (Municipal Act) states that municipalities enjoy financial and administrative independence and have the authority to establish public services, set tax rates, regulate transportation, and develop and manage public programs related to infrastructure, public health, and utilities (Decree 118 1977, Article 1). Despite what appears to be an expansive allocation of authority, municipalities are not able to pursue their own policy agendas. For example, the Municipal Act empowers three central government officials – the qa'immaqam, the muhafiz, and the Minister of the Interior and Municipalities – to oversee municipal decisions related to budgets, financial transfers, tax rates, the purchase of supplies and real estate, and the development of social programs (Decree 118 1977, Articles 60–64). To illustrate the extent of the central government's control over local affairs, municipal expenditures over LL20 million (~$13,333) must be approved by the qa'immaqam and those over LL80 million (~$53,000) must be approved by the muhafiz. Moreover, the central government also has the power to delay the implementation of any municipal decision in the interest of national security (Decree 118 1977, Article 65).

### Municipal Fragmentation

The second problem is that the central government has granted municipal authority to communities that are too small to provide their populations with essential public services (Atallah 2014a). By way of example, in 2012, approximately 70% of the 1,000 municipalities registered with the central government had populations of less than 4,000 people (Atallah 2012). Given their size, many of these municipal authorities do not have the resources or capacities needed to develop and sustain critical infrastructure systems, to take advantage of modern information systems, or to promote long-term development projects. The problems that can be caused by the size of Lebanon's municipalities are especially revealing in the area of human capital. Estimates suggest that 400 of Lebanon's municipalities do not employ a single public servant (Atallah 2012).

### Revenue Generation

The third problem is that municipalities do not have the authority to generate the revenues necessary to carry out their legal responsibilities. This is because the Municipal Act does not allow municipalities to establish taxes or fees or define their own tax base (Atallah 2014a). Rather, municipalities can only set their taxes and fees at rates that are established by the central government. More specifically, however, many municipalities do not

have the capacity to maintain tax schedules and are not able to identify existing or potential sources of revenue. In many instances, municipalities are not able to generate revenues because they do not employ sufficient numbers of tax collectors. These revenue problems also extend to the collection of municipal fees, which are not only set by the central government but have not been adequately revised after the devaluation of the Lebanese pound in the late 1980s and the early 1990s. Moreover, municipalities cannot access information about how much money they ought to receive from the collection of taxes and fees by the central authorities. Consequently, even when taxes and fees are collected by other public and private entities, authorities cannot ensure that the revenues are transferred to the appropriate municipality.

### Revenue Transfer Dependency and Inequality

The fourth problem is that many of Lebanon's municipalities are dependent on IMF transfers from the central government. According to the IMF disbursement formula, revenue transfers favor municipalities with large registered populations and sizeable direct revenues (Decree 1917 1979). Since the collection of direct revenues is dependent on real estate, for example, rental value fees on residential and commercial units, the disbursement formula also favors urban municipalities over rural municipalities. There are also uncertainties related to the amount and timing of the revenue disbursements that are made by the central government, which have an impact on municipal cash flows and undermine municipal public service programs and long-term development projects. The timing of the disbursements is especially problematic, as the central government can take up to 19 months to issue IMF distribution authorization decrees, twice the time required by Lebanese law (ICMA 2011).

## Decentralization Options

The 1989 Ta'if Agreement specifies that Lebanon is a state that possesses a strong central government. The Ta'if Agreement also calls for decentralization at the qada' level, where a council would be elected to ensure local participation. Despite its recognition that decentralization would promote national unity and development, the Lebanese government has yet to meet the goals of the Ta'if Agreement. An initial attempt was made in 2009, when the Lebanese Government approved the Council for Development and Reconstruction's *National Land Use Plan for the Lebanese Territory*, which called for regional decentralization. This plan was not realized, however, because it was not accompanied by the regulations and reforms needed to implement its decentralization directives.

A second attempt to meet the aspirations of the Ta'if Agreement occurred when former President Michel Suleiman and former Prime Minister Najib Mikati established a committee in November 2012 to draft legislation to transform Lebanon's qada's into regional developmental actors. Under this arrangement, the central government would focus on policy-making and regulation and the local authorities would focus on service delivery. The draft legislation, announced in April 2014, clarified responsibilities, provided fiscal support, and contained a mixture of incentives and disincentives to improve the capacity of local politicians and administrators. Substantively, the decentralization reforms detailed in the draft legislation were organized around five pillars (Atallah 2014b).

First, the legislation would establish representative regional councils at the qada' level, which would be held accountable to voters through elections. Second, the legislation would require the election of a 12-member executive team, including a president and vice president, elected by the members of the regional council. These executive teams would be responsible for guiding local planning activities in their qada'. Third, the legislation called for executive teams to be held accountable by their regional councils, which would approve decisions related to budgets, strategic plans, large contracts, loans, and grants. Regional councils would also receive the power to establish committees that would provide recommendations and expertise on key policy issues and put the members of the executive team up to a

vote of confidence. Additionally, independent and external auditors would oversee the financial activities that occur in each region. Fourth, the legislation made provisions for transparency, as all decisions and data concerning the region would be regularly collected and published. Finally, the legislation contained reforms that, if approved, would ensure that each region would have access to the financial resources needed to carry out their individual mandates.

The draft legislation would also adjust the fiscal system used to generate and distribute municipal revenues. Under the new system, the regional councils would be given the authority to administer a taxation system that is built upon the collection of real estate fees. These fees, in combination with the direct taxes and fees imposed by the qada', would account for 60% of regional revenues, while transfers from the central government would account for the remaining 40%. The IMF would be replaced with a "decentralization fund" that would have strengthened governance structures and expanded financial support. The fund would be administered by an oversight board, whose 18 members would be apportioned and elected in a manner that ensures the representation of qada's of all sizes and socioeconomic levels. The fund would be replenished through national revenues generated from 25% of VAT, 25% of customs revenues, 10% of total mobile phone bills, and 25% of inheritance fees. Allocations would be directed to qada's using the following criteria: (1) their level of development, with poorer qada's receiving more funds, (2) their surface area and population, and (3) their tax collection rate.

Formal consideration of the draft legislation was placed on hold after Prime Minister Mikati's resignation in February 2014 and President Michel Sleiman's term of office concluded in May 2014. Lebanon's next Prime Minster, Tammam Salam, did not raise the decentralization matter with the Council of Ministers. However, after the National Dialogue debates, which brought together Lebanon's major political groups in August 2016, the draft legislation was discussed as part of a basket of administrative reforms. It is not clear whether, following these developments, the draft legislation will find support among Lebanon's political elites and be recommended to the government for consideration.

## Decentralization Obstacles

Debates about decentralization in Lebanon often reference federalism, which can awaken macro-level fears that the country will fracture into sectarian cantons – a narrative associated with the civil war and the desires of some political groups to operate autonomously within self-administered territories. This narrative is often supported by those who view decentralization as a threat to Lebanon's consociational political structures, where power is shared at all levels of government by different sectarian groups. Ironically, when the central government does take steps to decentralize power and authority, it often does so to weaken opposition groups by concentrating them within institutional structures that can be controlled or constrained. At the microlevel, however, two practical obstacles explain why Lebanon has yet to pursue comprehensive decentralization-based reforms.

### Low Administrative Capacity

According to Lebanon's Office of the Minister of State for Administrative Reform (OMSAR), Lebanon's government and administrative officials are limited in their capacity to develop and implement public policy (OMSAR 2011). The deficiency in administrative capacity affects all levels of government, but it is especially problematic for municipalities. Assuming the central government adopted legislation that decentralizes power and authority, municipalities would struggle to undertake administrative tasks related to strategic planning, data analysis, decision-making, program evaluation, budgeting and financial management, the use of information technology, and the management of human resources. Moreover, there are also concerns that those employed by the civil service are not committed to undertake the reforms that would be necessary to improve the country's administrative

capacity (OMSAR 2011). Consequently, to be effective, Lebanese policy-makers must compliment decentralization reforms with substantial investments in administrative capacity.

### Elite Interests and Political Conflict

Lebanon's post-civil war governments have not embraced decentralization as envision by the 1989 Ta'if Agreement (Harb and Atallah 2015). As has been the case throughout much of the country's recent history, sectarian divisions, clientelism, and rent-seeking activities can prevent important policy issues from obtaining agenda status within Lebanon's governmental institutions (Bou Jaoude and Morachiello 2012). More specially, however, the lack of action on the issue of decentralization also relates to perceptions that shifts of power and authority would exacerbate political competition and antagonism. Given that confessional, demographic, socioeconomic, and family rivalries often paralyze Lebanon's political and administrative institutions, one concern is that decentralization may actually intensify struggles over the country's scarce resources. Therefore, as long as the consequences of decentralization are perceived to threaten the interests and stability of Lebanon's political elites, administrative reforms based upon notions of decentralization will remain an aspiration.

## Conclusion

Lebanon's contemporary administrative structures do not provide local municipalities the autonomy they need to manage their internal affairs. This problem has two interrelated dimensions, which create a predicament that undermines the ability of Lebanon's municipalities to deliver public services and engage in long-term development projects. On the one hand, Lebanon's municipalities do not possess the financial resources they need to develop effective and efficient administrative capacities. On the other hand, without effective and efficient administrative capacities, Lebanon's municipalities will not be able to generate the revenues they need to undertake administrative reforms. To overcome this predicament, Lebanon's central government can limit its control over local affairs through the decentralization of power and authority toward municipal authorities. The central government can also reconsider the minimum population thresholds used for the establishment of a municipal authority, promote the development of administrative capacity across all levels of government, and improve municipal revenues, for example, by modernizing the distribution formula and processes used by the Independent Municipal Fund. Given Lebanon's unique social and political contexts, however, reforms advanced in pursuit of decentralization will only be accepted if the political elite agree that alternative institutional arrangements are preferred over the status quo.

# Decentralization in Local Government Empowerment of Bangladesh

Shah Md Azimul Ehsan
Department of Public Administration, Jagannath University, Dhaka, Bangladesh

## Synonyms

Decentralization in Bangladesh; Decentralized governance in Bangladesh; Decentralized local governance; Local governance in Bangladesh

## Definition

Decentralization refers to a process of transferring authority and responsibility from the central/national government to the local government so that local entities can make effective decisions suitable for local needs.

## Introduction

Decentralization has become a buzzword and a much-debated policy issue in the academia and development parlance for the last few decades. It was put forward by the Western scholars and development agencies (World Bank, United Nations) as a means by which the transitional economies could overcome the ills of centralization which were haunting them since their independence. The theoretical rationale for the adoption of decentralization is that the transfer or devolution of authority and resources from central government (hereinafter referred to as CG) to local government (hereinafter referred to as LG) units would empower those units to undertake more effective self-governance and development activities suitable for local needs (Awortwi 2010; Bardhan and Mookherjee 2006; Balagun 2000; Oyugi 2000). In other words, such a mechanism not only limits the capacity of the CG in interfering over the affairs of those LG units but also helps to strengthen them (Rees and Hossain 2010). The policy response has been quite remarkable as most of the countries of the world undertook some form of decentralization (Manor 1999).

However, the question remains, has decentralization lived up to such expectations? Many scholars have boldly challenged the real benefits of decentralization drawing on the experiences from sub-Saharan African, Latin American, and few Asian countries (Crook 2003; Adamolekum 1999). Bangladesh, a country in South Asia, also belongs to this bloc. There is a plethora of literature that suggests that although the nation made several experiments and reforms with decentralization for strengthening local government institutions (LGIs), it did not yield the expected results.

In this milieu, the specific objective of this entry is to understand whether decentralization can really strengthen LGIs? If yes, then why the results have not been uniform for every country? In order to answer these questions, this entry takes Bangladesh as a case study and further dig into the literature for unraveling the constraining factors behind the country's limited success with decentralization. Having set the background in the introductory part, the next section starts with conceptualizing decentralization, followed by a brief discussion of various forms of decentralization and the "sequential theory of decentralization." The following section makes a review of

the potentials of decentralization in strengthening LGIs from a critical lens. The latter part of this paper sheds light on the Bangladesh case study, i.e., why decentralization has not taken roots in the country.

## Conceptual and Theoretical Underpinnings

### Decentralization

Scholars have defined decentralization from various perspectives. According to Falleti (2005), decentralization is a state reform process that consists of policy decisions regarding the transfer of responsibility, authority, and resources from higher to lower levels of government in the context of a specific type of state. Rondinelli (1981) comprehensively defined decentralization as a process of transferring the legal and political authority for planning, managing, and resource-raising from CG to field units or subordinate units of CG and autonomous or semi-autonomous LG bodies. Hence, decentralization is related to the transfer of power and authority to the local levels of government (Panday 2011).

### Forms of Decentralization

Countries have adopted different types of decentralization which include political, administrative, and fiscal decentralization. Rondinelli and Nellis (1986) have discussed four different forms of administrative decentralization, viz. deconcentration, delegation, devolution, and privatization. In deconcentration, the decision-making authority and financial management responsibility is shifted from CG officials to those officials or staffs working in regions, provinces, or districts. Local administrative units that are located outside of the national capital but subject to the supervision of the CG are examples of deconcentration (Panday 2011; Rees and Hossain 2010). In contrast to deconcentration, delegation is a more extensive form of decentralization. Here, responsibility for decision-making and administration of public functions is transferred to semi-autonomous bodies from CG. Although these bodies are not entirely controlled by the CG, they are ultimately accountable to them. However, in terms of decision-making, these organizations usually have a great deal of discretion (Siddique 2005). Interestingly, in the case of devolution, the LG units are strengthened with more autonomy which empowers them to operate remaining outside the direct domain of the CG. In other words, devolution provides the opportunity to local people for electing their representatives who then have the mandate and authority to raise revenues and make investment decisions. In such systems, LGs operate in well-defined geographical boundaries that are legally recognized. According to Wibbels (2004 cited in Panday 2011), this type of administrative decentralization underlies most political decentralization. While in privatization, CG transfers a few of their responsibilities to private entities or even voluntary organizations.

### A Sequential Theory of Decentralization

Falleti (2005) provided another perspective for understanding why decentralization outcomes have not been uniform across the globe. She developed a theory termed as "sequential theory of decentralization" drawing on the elements of path dependency, self-reinforcing sequences, mechanisms of reproduction, and institutional change with empirical evidence from Latin American countries. Falleti (2005) argued that the sequence in which the decentralization reforms take place in countries has a significant implication in strengthening or weakening the LGs. In other words, she stated that in an ideal situation, the sequence of decentralization reforms must start with political decentralization (i.e., devolution) followed by fiscal and administrative decentralization. However, in reality, most transitional countries start the decentralization process through administrative decentralization (i.e., either with deconcentration or delegation). As a result, more responsibility is transferred to LGs albeit with less power and resources. Consequently, inadequate funding affects the capacity of LGs in fulfilling their responsibilities. As a matter of fact, those LGIs get dependent on CGs which force them to comply with various terms and conditions related to those grants. Thus, such a situation is created that benefits the CG politicians and the bureaucrats and so

they stall further attempts to empower LGs. Falleti (2005) further expounded that whatever experiments or reforms might not be done in the name of strengthening LGs, the inherent intention remains to reinforce more control at the hands of CG. This results in further retardation of LGIs (Awortwi 2010).

## Potentials of Decentralization in Strengthening LGIs: A Critical Review

Proponents of decentralization strongly believe that decentralization has the potential to strengthen LGIs. They regard the decentralization of power to the local people as a fundamental component of democratization, good governance, and engagement of citizens. These advocates also argue that if the real power of decision-making, planning, managing, resource-mobilizing, etc. is devolved to the local representatives, then LGIs can be really effective. Those LGIs then would formulate policies as per the aspirations of the local people. The implication of such a policy will be the enhanced quality of public services which would foster local development (UNDP 2009; Francis and James 2003; De Vries 2000). Few empirical studies conducted by Blair (2000), Parker (1995), and Rowland (2001) also suggest that decentralization did improve the democratic governance in both large cities and small towns in India, Brazil, Bolivia, Colombia, Honduras, Mali, Mexico, the Philippines, Ukraine, and Mexico.

However, critics of decentralization negate such propositions of decentralization advocates. Rather, this group of scholars opines that decentralization does not necessarily strengthen LGIs. The most compelling and glaring empirical evidence which they refer to is the case of sub-Saharan African countries where decentralization has significantly failed and led to "elite capture" (Crook 2003; Francis and James 2003). Arguing in the same vein, Khan (2016) and Panday (2011) noted that decentralization in Bangladesh has remained more as policy rhetoric. Moreover, few observers also commented that decentralization reform attempts in Bangladesh also resulted in "elite capture." Scholars like Fan et al. (2009) and Prud'homme (1995) went one step further and stipulated that decentralization fosters corruption. Their line of argument is that decentralization will lead to the creation of more tiers of government at the local level, which will open up more avenues for filling up pockets of the local bureaucrats making the situation deplorable.

So, which bloc is right as both the group of scholars have their arguments? Manor (1999) rightly noted that albeit decentralization is not a panacea for the ills of over-centralization, it has got many virtues and is certainly worth pursuing. Therefore, this chapter takes the side of the first camp that decentralization can make the LGIs strengthened, provided it is handled with real intentions of devolving power. Having said that, it must also be remembered that not all forms of decentralization will yield similar results. Rondinelli and Nellis' (1986) "forms of decentralization," as discussed in the earlier section of the paper, provide a conceptual framework to understand and analyze why LGs in few countries are stronger while the scenario is a total reverse one in other countries. This is because their framework clarifies what extent of power CG retains and what sort of autonomy LG enjoys. For instance, if a country has such a decentralization scenario which has more elements of devolution with a limited amount of deconcentration and delegation, then that country will have robust LGs with more autonomy. Conversely, if the same country has a decentralization that heavily relies on deconcentration and delegation with a limited amount of devolution, then the LGIs of that particular country will be weakened. In other words, LGs of that country will suffer from lack of funding, limited resources, and lesser discretion in making local decisions. All these will make those LGs dependent on the CG.

Falleti's (2005) sequential theory, as discussed in the earlier section of the paper, also provides some valuable insights for understanding this complex phenomenon. According to her findings, LGs can be strengthened provided the process of decentralization maintains a sequence, i.e., starting with political decentralization (devolution), followed by fiscal and administrative decentralization. However, she rightly observed that a coalition is often formed in transitional countries between CG and bureaucrats who do not want to

devolve the power to LGs. As so, the sequence of decentralization gets reversed. In other words, they mostly introduce administrative decentralization (deconcentration or delegation) at first instance. As such a decentralization fulfills the interest of both the CG and the bureaucrats, they further reinforce it. Often CG makes attempts to strengthen LGs by bringing changes in the structure or nomenclature of LGs (as the case of Bangladesh will reveal in the next section). Nevertheless, the real motive behind such so-called reforms is simply to solidify the position of the CG. And the scenario is perpetuated which makes LGIs further weak and to exist just in the name!

## Analyzing the State of Decentralization in Bangladesh

This section will shed light on the state of decentralization in Bangladesh and analyze why decentralization has had limited success in such a country that has a rich history and legacy of establishing and promoting LGIs. Before moving on to the discussion, it is important to understand the national context in which LGIs operate here. Bangladesh is a unitary state composed of divisions, districts, subdivisions (Upazilas), municipalities, and city corporations, having Union Parishads (UPs) at the lowest level. The country is governed through a unicameral legislature that guides public policies through a wide network of bureaucratic agencies. In this context, LGIs have practically no scope to operate independently of the influence of overwhelming CG (Huque and Panday 2018).

Bangladesh inherited the colonial structure of local government since the country was under the British Raj and Pakistan for 190 years and around 24 years, respectively (Panday 2011; Ehsan 2020). Hence, the subsequent governments since independence made several attempts to strengthen decentralized local governance. The aspirations for LGs have also been enshrined in the constitution of Bangladesh (Article 11, 59, 60). Nonetheless, the actual role and contribution of these institutions to augment citizens' participation and consolidate democratic practices have often been below par. Overwhelming central interference, abuse, and manipulation by authoritarian regimes to perpetuate their power have been the predominant reasons for Bangladesh's limited success in decentralization (Siddiquee 1997; Rahman 1994; Sarker 1990 cited in Khan 2016).

However, over the past decade, major efforts have been undertaken in Bangladesh for strengthening the role and capacity of LGIs (Ehsan 2018). Development partners, over and again, echoed their voices for stronger, effective, participative, and accountable LGIs. Various policy documents, including five-year plans (sixth and seventh), reflect the commitment of the Bangladesh government in complying with such suggestions to consolidate decentralization (Aminuzzaman et al. 2015). Moreover, several attempts have been taken for transforming the traditional and largely unresponsive UPs into increasingly participatory and pro-people institutions through the introduction of participatory platforms like Ward Shavas, Open Budgeting System, and Standing Committees (Bhuian 2014). Furthermore, legal provisions for LGIs to play a stronger role have clarified and expanded. In simpler terms, currently, there are separate systems for rural and urban areas of LGIs which are guided by their own separate and operational framework. Meanwhile, fiscal transfers to LGs have also significantly grown in size. Another commendable recent trend has been holding regular elections at various LGIs (Khan 2016). Ahmed et al. (2014) and Aminuzzman (2013) noted that, due to these recent initiatives along with the project-based local development activities patronized by the development partners, LGIs are increasingly looking to play a meaningful role, both as platforms for deepening local democracy as well as mechanisms for the improved localized services.

Contesting such claims, which mostly emanate from the consultancy reports patronized by government and donors, many scholars argue that despite recent reforms, the country is still plagued with such a LG system where CG holds a dominating position. In other words, the main principles of decentralization are being done in the spirit of deconcentration and delegation with the limited scope of devolution. This means that the CG retains control over LGIs through various means, depriving them of adequate power for making

decisions even on local issues. Despite the delegation of power to act on certain matters, LGIs are restrained through procedures and requirements for approval that make them accountable to local field offices of the central government. For example, the budget of the UP requires final approval from the Upazila Nirbahi Officer (UNO) before implementation (Huque and Panday 2018). Such an authoritative relationship pattern created scope for field-level government officials, i.e., the Deputy Commissioner (head of the administrative unit of the district) and UNO (head of the administrative unit of subdistrict) to control the LGIs. Moreover, the current legal provision empowers the CG to issue circulars for controlling activities and conducting inquiries of LGIs, and even suspending the elected representatives in the event of misconduct (Huque and Panday 2018). Bhuian (2014) rightly noted that, given the national political culture, this power is most likely to be abused by the CG if it fails to ensure that the elected representatives of LGIs do not adhere to its instructions or policies.

Again, recent local government laws have transferred many responsibilities (health, family planning, education, etc.) from the CG to LGs but with few resources. Although LGs have the authority to raise the tax from the local sources, it so happens that the amount of taxable items is so low that it becomes insufficient to meet their day-to-day expenses (Panday 2011; Ehsan 2020). Consequently, LGIs have to depend on central funding which typically comes in the form of "block grants" and other project aids. Khan (2016) rightly pointed out that these resources remain a major avenue for central manipulation and interference as there is no clear budgetary formula for the allocation of resources for LGIs.

Another recent phenomenon that has sparked much controversy is about the national MPs being provided with an advisory role on LGIs, who is neither elected nor has any voting right in those LGIs. Earlier the Shawkat Ali Commission and more recently Khan (2016) and Islam (2018) argue that the so-called "advice" of MPs often turns into an "executive order," overriding and controlling development plans and actions by the elected representatives at Upazilas. As a matter of fact, such a role of MPs not only curtail the autonomy of LGIs but also make them subordinate to the party in power. Regarding recent elections of LGs, many independent observers, for instance, Majumder (2014) and Hussain (2014) reported about the widespread fraudulent practices and manipulations. As a result, the outcome of those so-called elections has been simply "elite capture" and consolidating the local support base of the ruling regime.

Therefore, it is evident from the above discussion that the current state of decentralization in Bangladesh is in no way facilitating the pathways for the effective functioning of LGIs. Rather, LGIs are operating simply as agents of CG. The interesting thing to note here is that there have been several regime shifts since independence but this grey situation of decentralization has remained constant for the last 50 years. This pinpoints a vital issue that the political masters in Bangladesh never believed, and perhaps, still do not believe in real devolution of power. Quite astonishingly, this is one of the rare areas where both the government and the opposition have been on the same wavelength (Panday 2011). Again, the decentralization policy in Bangladesh is mostly concentrated on the principles of deconcentration and delegation, where CG retains most of the authority and control of LGs. This has been another factor behind Bangladesh's limited success with decentralization. Rondinelli and Nellis (1986) considered this sort of decentralization as less desirable. And it is rather ironic that this has been perpetuated for around half a century in Bangladesh! But why? It is because, as mentioned above, political leaders in Bangladesh never wanted to devolve power and change the ongoing status quo of weak LGs as it has been benefiting their interest. So, when such a situation prevails, Falleti (2005) rightly noted that CG keeps on reinforcing decentralization efforts through the strengthening of deconcentration and delegation with fewer elements of devolution. The case of Bangladesh reveals a similar scenario where recent decentralization reforms have transferred more responsibility to LGs but with less power and resources

which has not only affected their capacity of effective functioning but also led to central dependency. Moreover, Falleti (2005) also pointed out that CG will stall any reforms for empowering LGs to ensure that their vested interests are not threatened. The same picture was seen in Bangladesh back in 2007–2008. The military-backed caretaker government brought some radical reforms for strengthening LGIs. Quite interestingly, those were entirely ditched by the next political government when they resumed office after the ninth parliamentary national elections (Khan 2016). Rather, they followed the footprints of their predecessors.

## Conclusion

The purpose of this entry was to understand if there is a positive impact of decentralization in making LGIs stronger. The study found that decentralization has got enough potentials to offer to policymakers which if implemented with good intentions can make LGIs more effective. Having said that, the entry argues in the same vein as (Faguet 2018), and challenges the popular notion that decentralization is not like a switch that will have symmetric results everywhere. Rather decentralization has to be viewed from the political-economic lens, i.e., as a political initiative and as a political process, to better comprehend its consequences in a particular setting (Samoff 1990). This implies that whether decentralization will lead to robust LG will depend on the contextual factors where it is applied. The case of Bangladesh revealed that the unwillingness of the political masters to devolve real power to LGs was the prime reason that decentralization did not yield expected results there. However, the reason might be quite different when investigated and analyzed for other countries.

## Synonyms

Administrative reform; Governance; Public services; Strategy

## Definition

Decentralization — It means transfer of power and authority from the central government to local or sub-national units of the government for the meeting of grassroots people's demands.

It is a sociopolitical process that transfers

| | |
|---|---|
| | authority and responsibility in planning, management, and decision-making from central government to local authorities. |
| Centralization | It is defined as the concentration of decision-making authority in the organization. Concentration of authority in strategy-making can be defined as the number of people who are involved in the decision-making process of the most important goals of the organization. It can emerge if a decision needs to be approved by higher hierarchical levels. |

## Introduction

Optimizing the quality of public service is imperative for governments worldwide. Poor quality might be rooted in organizational structure. For example, Burns and Stalker's (1961) classical model predicted that mechanistic structures characterized by high formalization and centralization would improve performance under conditions of low environmental uncertainty. As a result, the primary reason behind calling for decentralizing the public sector is the strong belief that decentralization has potential for improving the quality of services provided, and allowing for better coverage, thus leading to increased equity in the service delivery. This is consistent with the Ugandan government that introduced decentralization so as to improve service delivery. This was enshrined in the Constitution of the Republic of Uganda (1995) and operationalized by Local Governments Act (Cap. 243). Public services were, indeed, taken nearer to the citizens as a result of increased participation in decision-making at various levels of local governments. This is seen in the case of Bushenyi Local Government in Western Uganda that brought on board all councilors at the community level to engage in health, education, food security, and income initiatives. The higher local authorities in local government came up with resolutions that were found to be binding and always adopted.

The territorial dispersion of authority has in recent years gained increasing attention and is especially apparent through a wave of reforms that addressed service administration and delivery. This trend involves activation policies directed at social assistance recipients. Hence, there are several reasons for promoting decentralization, including increasing service delivery effectiveness, efficiency of resource allocation, public worker motivation, financial lucidity, and community participation and representation, in addition to equity and private sector participation. Nonetheless, the success of decentralization in meeting these objectives depends on many dynamics and circumstances. It is believed that by expanding the power at the district level and by moving to a more horizontally structured system of the public sector, resistance to change may develop among those who are at risk of losing power from decentralization. Initial losses in efficiency and increased liability may also occur as power is transferred to lower levels until administrators become accustomed to their new responsibilities. Other reasons for practicing decentralization include increasing local ownership and accountability, strengthening integration of services at the local level, creating a realistic and integrated public service that accommodates local preferences, controlling costs of targeted communal programs and improving their implementation, and reducing discrimination that results in differences in government delivery of services to rural and urban populations (Kassak et al. 2007).

Authors have advanced that centralization of indirect tasks in institutions, as shown by separate staff-line divisions, is harmful for job autonomy. As a result, they posit that organizations need to decentralize indirect tasks from supervisory, administrative, or managerial units to more productive service units. Huys et al. (1999) relate the centralization or decentralization in organizations to task segregation or task integration in jobs.

First, they demonstrate that highly centralized organizations have more vertically segregated jobs, meaning that these jobs may consist of both direct tasks in service units and indirect tasks in separate supervisory, administrative, or managerial units. In other words, because indirect tasks are assigned to specialized units, these tasks cannot be assigned to individual service jobs. Second, they state that organizations with a decentralized structure have a higher chance of vertically integrated jobs, consisting of indirect and direct tasks. This can be explained in terms of the absence of specialized units for fulfilling indirect tasks. Nonetheless, organizations with a decentralized task division can still include a vertically segregated job structure. A useful example would be the specialized employees in teams that fulfill all the indirect tasks (e.g., quality control, maintenance, and repair).

## Dimensions of Decentralization

Decentralization is the transfer of authority from a higher level of government to a lower level. The main rationale for decentralization is that people at the lower level of a hierarchy are more knowledgeable about their own needs and challenges. This is conceptualized from the thinking that people have more control and input into their own lives at a local level which enhances development initiatives from the popular majority, particularly the local poor. It assumes that there has been centralization before the decentralization. As a concept, it means different things to different people and can be seen from different critical perspectives: political, social, and administrative. It has been defined as the movement of powers and functions from the center to territorial sub-national units of government. Koontz and Weihrich (1990) argue that decentralization is a tendency to disperse decision-making authority in an organized structure. Lutz and Caldecott (1996) define decentralization as a process by which property rights and bargaining powers are redistributed among the levels of society.

Decentralization has been a continual focus of attention of both scholars and practitioners for more than half a century. Even though there is general agreement on what decentralization is, there is no consensus about how it should be measured. This entry builds on the existing body of literature that specifies three major dimensions of decentralization: political, administrative, and fiscal. Political focuses on citizens participating in electing their local leaders. Administrative also (unpacked in terms of deconcentration and delegation) pays attention to implementation and optimum utilization of resources in a delegated form, while fiscal decentralization transfers two things to local governments: funds to deliver decentralized functions and revenue generating power and authority to decide on expenditures. It is both an economic and a political process involving the transfer of financial authority from the center to the local governments in order to carry out decentralized functions effectively. Fiscal decentralization may also be designed to bring about cost containment and greater financial control. Here, local priorities are mainly focused on streamlined and targeted programs that should lead to greater efficiency when compared to programs run by the center. This makes public investment in local government more progressive and responsive to the people, including disadvantaged groups, than is the case with centralized government.

## Decentralization in Uganda

Since Uganda attained independence in 1962, the management of public services has been alternating between different stages: centralization, decentralization, and recentralization. By and large, decentralization is about shifting decision-making responsibility from the central government level to the local level within a country. Local self-governance was made operational in Uganda since the 1990s. During the 1990s there was significant progress in the development of public systems under the framework of long-term public plans and policies, guided by a vision

of equitable access and the principles of community participation. This was through the Constitution of the Republic of Uganda (1995), under the democratic principles that directed thus: *The State shall be guided by the principle of decentralization and devolution of governmental functions and powers to the people at appropriate levels where they can best manage and direct their own affairs.*

The constitution therefore legalized decentralization through which local governments were established as body corporate entities with powers to provide services to the citizens. The reforms respond to traditional political systems in some parts of the world, particularly in Asia, which have been highly centralized for centuries. Therefore, local governments were introduced in many developing countries through colonization and development assistance, often taking a form that neither met their intended purpose nor gained acceptance from the local people. Uganda's attempt to decentralize was first registered during colonialism when colonial masters set up local administration in Uganda in 1919 by passing the African Native Authority Ordinance which provided unlimited judicial, executive, and legislative powers to chiefs and made them entirely responsible to central government. The chiefs collected taxes, presided over native courts, maintained law and order, and constituted native councils at district and lower levels (Nsibambi 1998).

The center-local relations deteriorated in 1966 when the conflict between Buganda (in central Uganda) and the central government was resolved militarily. A year after the 1966 crisis, the 1967 Local Administrations Act which centralized power and stifled local decision-making was enacted. In the period 1972–1985, institutions of local self-governance atrophied while centralizing tendencies were reinforced. The situation started changing in 1986 when the National Resistance Movement took charge of the government of Uganda after a 5-year people's uprising that transformed into a protracted war against the previous leadership that was accused of disabling structures of democracy despite being a product of universal adult suffrage. From the onset, the government set out to empower the people and reawaken the spirit of local participation in all spheres of local governance, and decentralization was considered fundamental in this process. The government of Uganda instituted a Commission of Inquiry into the local government (LG) system (GoU 1987). The commission collected views from all parts of the country and recommended that Uganda should adopt a decentralized system of governance. In 1992, the decentralization policy was officially launched, and this was followed by enacting the Local Governments Statute (1993) which legally devolved certain powers and responsibilities to LGs. In 1993, the highly centralized administrative structure of Government including budgetary management in Uganda was decentralized. Decentralization was strengthened by its inclusion in the Constitution of the Republic of Uganda (1995) and consolidated further in the Local Governments Act 1997 (Cap. 243).

The Local Governments Act 1997 (Cap. 243) and Uganda Constitution 1995 gave local governments autonomy to formulate and approve own budgets and budgeting in 1994/1995 with the first batch of 13 districts receiving a vote system. The local government decentralization program devolved functions and services to these local governments. Decentralization was implemented in phases involving only recurrent expenditures. The first batch of 13 districts operated a vote system in 1993/1994. The line ministries, whose services were decentralized, identified the activities and computed the amount of money spent on those activities in the fiscal year before decentralization was transferred to the local governments. The second phase started in 1994/1995 and the third phase in 1995/1996 which involved 14 and 12 districts, respectively. In the second and subsequent years, the districts received block grants. The decentralized system allowed the District Council to allocate the funds according to its priorities since the funds previously provided under the vote system and earmarked for specific activities were aggregated and sent to the district as a block.

## Merits of Decentralization

There are several reasons for promoting decentralization, including increasing service delivery effectiveness, efficiency of resource allocation, health worker motivation, financial lucidity, and community participation and representation, in addition to equity and private sector participation Nonetheless, the success of decentralization in meeting these objectives depends on many dynamics and circumstances. It is believed that by expanding the power at the district level and moving to a more horizontally structured system of healthcare, resistance to change may develop among those who are at risk of losing power from decentralization (Aitken 1998). Initial losses in efficiency and increased liability may also occur as power is transferred to lower levels until administrators become accustomed to their new responsibilities (Bossert and Beauvais 2002). Other reasons for practicing decentralization include increasing local ownership and accountability, strengthening integration of services at the local level, creating a realistic and integrated health service that accommodates local preferences, controlling costs of targeted health operations and improving their implementation, and reducing discrimination that results in differences in healthcare delivery to rural and urban populations.

Another important reason for decentralization is the better understanding of the local situation of the units. Decentralized activities can adapt to the local environment more easily than centralized ones. Several studies show decentralized organizations can be more resistant because divided responsibilities help institutions to make better decisions and adapt faster. Meyer's (1982) research shows that a decentralized structure fosters organizational learning even in the time of crisis. Moreover skill-intensive institutions can witness larger productivity growth after decentralization. These can be supported by new knowledge and viewpoints. Decentralization can foster entrepreneurial behavior within the organization as well.

Political devolution has been a major milestone of the decentralization in Uganda. In particular, electing of local leaders, political representation, and legislation in councils have been positive. The citizens have been enabled to choose their leaders periodically through adult suffrage. Another achievement of the decentralization policy has been the reversal of centrally driven to area-based planning and budgeting. This has facilitated the inclusion of locally felt needs and dealt with unique locality challenges such as bridges, food security, and needy students' scholarships that could not be anticipated or determined at the central government level. There has also been increase in volume, access to, and quality of social services in local governments over the past two decades.

## Conclusion

Many developing countries, Uganda inclusive, have at some point in their quest for improved public service delivery considered decentralization as a strategy. This entry demonstrates the power of decentralization in fostering public service delivery using the Ugandan experience. In conclusion, the system in Uganda before 1992 was centralized; however, after that period and as a result of decentralization, the structure and quality of public services improved. This is largely attributed to lowering decision-making that affects administrative efficiency to the local level. All in all, decentralization is associated with increased service access, utilization, and improved service delivery. This is consistent with previous scholars (Anderson 2004; Bossert and Beauvais 2002; Lutz and Caldecott 1996) who provide evidence that decentralization enhances service-level performance. This study found that community-managed public services have merits: developed ownership, empowerment to enhance planning and monitoring, greater transparency, and improvements in resource management by local government authorities.

## Introduction

The principle of local autonomy in Japan has been protected and guaranteed by the Japanese Constitution promulgated in 1947. Under the preceding Meiji Constitution, the system of local autonomy had no constitutional basis for its existence. The mere notion of local autonomy was arbitrarily rendered subject to parliamentary laws or interpretation of administrative rules by the central government officials. Now, under the new Constitution of Japan, a new chapter of "local autonomy" was provided, and a "Local Autonomy Act" was legislated. Both the new Constitution and the Local Autonomy Act were enforced on May 3, 1947.

While the new Constitution incorporated the provisions on guaranteeing local autonomy, even under the new Constitution, there remained the prewar customary procedures of the central government delegating national administrative matters to chiefs and other officials of local governments that would function as subordinate administrators of the central government. Such delegated administrative services were conducted by local chiefs that came under direct instructions by the central government. The enhanced guidance and intervention in local matters by the central government are derived from the following reasons: (1) the need for the central government to readjust the then widening regional differences and discrepancies in the degree and pace of economic development during the high economic growth period of Japan, (2) the volume of matters uniformly and nationally to be administered augmented, and (3) the population outflow from local communities into large cities left behind sparsely populated regions that came to fail to perform properly in local administration, thus seeking dependence on help from the central government.

But the centralized system that functioned properly during the postwar high economic growth period gradually came to reveal symptoms of what may be termed "institutional fatigue." It is true that on the one hand, the centralized system founded in the Meiji period did properly function in providing administrative services across the country uniformly. On the other hand, however,

regional differences or individualities and diversities were not duly considered. The central government, by way of its subsidy grant and partial redistribution of tax revenues to local governments, kept intervening in local matters. Consequently, local governments were discouraged from addressing on their own local community development, which came to disrupt a well-balanced efficient administrative and financial comanagement of local communities.

After the 1970s, under the unfavorable conditions of stagnant economy, both national and local governments came to suffer financial plight. In order for the entire nation to address the issues of globalization of economy and aging population, the hitherto operational system of centralization came to prove irrelevant. Rapidly and radically changing international circumstances required the central government to deal rapidly with those changing external conditions. This new development pressed the central government to reduce the degree of its involvement in local communities and in turn to devote more of its capacity to issues of foreign policy and national defense. Meanwhile the issues of aging society and declining birth rate called for further direct involvement of local governments operating in the communities of daily life of local residents. At present, not only the resident population but all the services of industry, finance, information, and culture are densely concentrated in the Tokyo metropolitan area. This is contrasted to the situations in local communities where depopulation continues to induce disruption of local economic structure. To reverse such negative trends and to foster human capitals that can contribute to revitalizing local communities, some kind of institutional reforms came to be considered in order. Such new reform plans would call for management of different local communities in such a way that best suits its local conditions and features, rather than trying to apply uniform administrative methods across different communities.

The local administrative system reform plan intended for a radical restructuring of relations between the central government and local governments was started for the first time after 1945, with the resolution of June 1993, respectively, declared in the Japanese Lower and Upper Houses, the "Resolution on Promotion of Decentralization Reform," as cited below:

> The heavy concentration of things in Tokyo that incurs various problems must be redressed in such a way that can help develop in a well-balanced way our national land. For the entire nation to create a society where people can enjoy a leisurely affluence, much work is expected to be accomplished by local public entities. The existing system of centralized administration of local matters should come under an in-depth review and further devolution or decentralization of public administration is strongly called for. It should be an urgent task for the central government to respond positively to the wishes of the people, to review the existing relations between the central government and local communities, to delegate some central authorities to local governments, to enhance local tax revenue sources and thus help strengthen autonomy and self-rule of local communities, which should all help establish a local system of autonomy commensurate with the newly emerging needs in the 21st century. Accordingly, relevant legislative and other measures must be urgently pursued and implemented all out in a resolute manner.

D

## Decentralization Reform

### Basic Principles for Decentralization and a System to Promote Decentralization

The "Fundamental Principles for Promoting Decentralization" as determined in December 1994 by the Cabinet meeting called for, in the same manner as the above-cited resolution by both Houses of Diet, as part of the essential ground rule for promotion of decentralization, a review of responsibility sharing between the central government and local governments, promotion of delegation of authorities from central to local governments, and enhancement of financial ground structure of local communities.

By the "Decentralization Promotion Act" enacted in May 1995, the "Committee for the Promotion of Decentralization" was inaugurated in July of the same year, marking a real start-up of the process. The committee conducted surveys and deliberations to promote decentralization, made recommendations to the Prime Minister on specific guidelines to be set to promote decentralization as formulated by the government, oversaw

how actual policies were conducted to implement the decentralization as planned, and reported its findings to the Prime Minister.

During its 6 years of activities (1995–2001) (by the revised Decentralization Promotion Act of May 2000, its activities were extended for 1 more year), the Committee for the Promotion of Decentralization sent five recommendations to the government. Those recommendations induced formulation of two government plans on decentralization determined, respectively, by the Cabinet meeting in May 1998 and in March 1999. Finally in July 1999, the "Omnibus Decentralization Act" was enacted.

Thereafter on, the Committee for the Promotion of Decentralization continued its oversight on implementation of the two decentralization plans and, on two occasions in August and November 2000, presented its findings to the Prime Minister with its advice. In June 2001, the committee submitted its final report, and in July of the same year, the committee was disbanded. Those measures of local community reforms as implemented according to the committee recommendations are called the "First Phase of Decentralization Reform."

In the final report of the committee, specific cases of positive results of the First Phase of Decentralization Reform were featured, and the following six items were raised as remaining tasks to be pursued: (1) restructuring of local public financing system, (2) relaxation of obligatory and compulsory conditions, (3) exploration of some new structure of local autonomy, (4) delegation of administrative authorities, (5) expansion of autonomy by local residents, and (6) specific implementation of "real nature of local autonomy" as stipulated in the Constitution.

With a view to continuing the task of the First Phase of Decentralization Reform, the "Council on Promotion of Decentralization Reform" was instituted on July 3, 2001 as a consultative body for the Prime Minister (temporary measure until 2003). Noting that the positive results of the First Phase of Decentralization Reform were confined to the matters previously agreed upon between the Committee for the Promotion of Decentralization and the ministries concerned, this new council raised a banner saying "no sanctuary is allowed before the reexamination of division of work between local communities and the central government." The new body came to conduct surveys and deliberations on "the ways for the central government and the local communities to split their respective work, their tax revenue sources, their promotion of administrative and financial reform plans, and other relevant important matters."

Then the system of promoting decentralization was taken over, under the first Shinzo Abe Administration, by the "Committee for the Promotion of Decentralization Reform" which was instituted by the "Decentralization Reform Promotion Act" enacted on December 8, 2006. The Committee upheld the slogan "local communities must play the principal role in nation building."

The committee issued four recommendations which led to legislation of a series of seven laws: "Laws on recompiling relative laws on promotion of reforms to uplift autonomy and independence of local communities." (First Package Law, April, 2011; Second, August 2011; Third, June 2013; Fourth, May 2014; Fifth, June 2015; Sixth, May 2016; Seventh, April 2017). These seven laws have been enacted under the government of Democratic Party of Japan (Sept. 2009–Dec. 2012) and the Second Abe government (Dec. 2012~). Under these laws the "Second Phase of Decentralization Reform" has been implemented.

The present structure of the decentralization reform promotion was launched in March 2013 under the leadership of a newly set up "Headquarters for Promoting Decentralization Reform" that replaced the "Local Sovereignty Strategy Council" instituted under the government of Democratic Party of Japan. The headquarters comprise the Prime Minister acting as chairman and all cabinet members. The ground work to be reexamined by the headquarters was supposed to be first developed and reviewed by the "Advisory Council on Decentralization Reform" instituted in April 2013 under the Minister of State for Decentralization Reform.

## Results of the Proposed Decentralization Reform

Hereunder to be reviewed are the results of how the reform plan fared according to the rules set in

the "Fundamental Principles for Promoting Decentralization" of 1994.

### Explicit Division of Work Between the Central Government and Local Governments

After the enactment of the Omnibus Decentralization Act, the Local Autonomy Act underwent an extensive revision. The revised law, under Item 2 of Article 1, stipulates the principle of division of work between the central government and local governments. Under the same Item 2 of the law, the law defines the role of local governments as "promote welfare of local residents" and "administer in an autonomous and comprehensive manner local public services. The same law in the following paragraph 2 defines services to be administered by the central government as those relating to "matters affecting due existence of our nation state in the international community," "matters affecting people's activities that should hopefully be nationally standardized or matters relative to basic rules on local autonomy," and "implementation of policies and undertakings that should be conducted on a national scale or from a national perspective." Further, the law requires the central government to do the following: "Essentially administrative services to be conducted closer to local residents should be turned over to local governments. Thus the central government should properly exercise the division of work with local governments and see to it that autonomy and independence of local government are duly and fully established and developed."

### Transfer of Authorities from Central to Local Governments

**Abolition of the System of Delegated Functions**

The most notable positive result from the First Phase of Decentralization Reform was the abolition of delegation of services from central to local governments. The erstwhile system of administrative service delegation from central to locals deemed governor and mayors or those chief executives of local governments as organs of the central government. The latter were to execute the delegated services for the central government. This system that placed local governments in the subordinate positions and under the supervision by the central government really symbolized the nature of "upper versus lower echelons of governments or of superior versus subordinate relations." There persisted controversial issues from a perspective of legitimate local autonomy: the chief executives directly elected by local residents had to execute matters delegated from the central government, functioning simply as a subordinate body of the central government; the local assembly or council could not establish any rule on matters delegated from the central government or intervene in matters delegated from the central government.

The Omnibus Decentralization Act categorized into two groups administrative services to be administered by local governments: "statutory entrusted services" and "self-governing services." "Statutory entrusted services" are defined as follows under the Article 2, Item 9, Paragraph 1: "Among the services determined by laws or executive orders derived from such laws as to be executed by the local governments, such services that should be in principle executed by the central government. The central government must see to it that such services be properly executed." Other than these, in principle, those other services that are not legally delegated services from the central government come under direct jurisdiction of local governments (Article 2, Item 8 of the Local Autonomy Act).

**Intervention by the Central Government and Rearrangement of New Rules on Necessary Supervision**

- Establish New Rules on Intervention by the Central Government

  Together with the abolition of the delegation of central government services to local governments, the comprehensive oversight by central ministers regarding matters hitherto delegated to local governments was also abolished. A new set of rules on central intervention was incorporated in the Local Autonomy Act. The law in its Article 245, under Item 2, "intervention based on legal stipulation,"

D

requires any central intervention to specifically refer to a relevant legal ground from a law or an executive order derived from such a law.

Further under Item 3 of the same Article 245, the law explicitly stipulates the ground rules that any intervention from the central or prefectural governments into ordinary local public communities must be limited to a minimum necessary degree and that due consideration must be given to autonomy and independence of the local communities concerned. Conforming to this ground rule, as to cases of intervention by the central and regional governments into local communities, there are stipulated, from the Item 3 of the same Article 245 of the law to the Item 6 of Article 250, essential rules on intervention, standards of administrative disposition, and intervention procedures, covering the following matters as listed under Article 245, Item 1 of the Local Autonomy Act: advice, recommendation, demand of reference materials, demand of correction, consent, approval, recognition, instruction, subrogation of administrative acts, and consultation.

In anticipation of a case of dispute on matters concerning central and regional governments' intervention into local community matters, an impartial and neutral body of deliberation on legitimate legal interpretations was instituted in 2000 within the Ministry of Internal Affairs and Communications. This Central and Local Government Dispute Management Council is composed of five members confirmed by both Houses of Diet and appointed by the Minister of Internal Affairs and Communications. The five members are appointed for a term of 3 years, and the chairman is co-opted from among the five members. When an order from the central government to a local government to rectify things or permit things is denied by a local government or when grievances are brought up from local governments to the central government regarding other central exercise of government prerogatives, such controversial cases are brought before the commission. When the government case is judged illegal, the committee advises the government to take necessary measures to rectify things. When the original plaintiff party of the local government does not agree with the rulings by the commission, the local government can bring up the case to a court against the chief executive of the central government.

- Recompilation of Mandatory Control by the Central Government

  Mandatory control by the central government over local governments is a way of central intervention into local administrative systems. This is intended for cases of delegating central administrative matters to local governments. To secure a certain level of quality and quantity of national administrative services rendered to the people, local governments are required to assign personnel, provide facilities, and appoint qualified specialists. There are three broadly divided areas of control: (1) assignment of qualified personnel; (2) matters concerning administrative body, system, and facilities; and (3) institution of deliberative bodies and such other attached service systems.

  The call for relaxation of mandatory control came from the recognition that such control restrains the right to organize autonomy of the local governments and the right to determine number of local legislative representatives and local personnel management policy. The new concept intends for the local governments to offer administrative services relevant to locality and also flexibly to establish and use local systems on their own. Central control was reduced to the necessary minimum, and now when a new control is to be set, a new law or an executive order derived from such a law should be referred to.

**Transfer of Authorities and Deregulations (Review of Obligation and Framework Imposition)**

The transfer of authorities from central to locals and the deregulations realized by the waves of decentralization reform essentially aimed to realize autonomous and comprehensively competent local administration. The waves of deregulations were implemented with priorities given to city-, town-, and village-level administrations that deal with matters closest to local residents.

- Transfer of Authorities

Transfer of administrative matters and power from the central government to local authorities was conducted according to the Fourth Package Law. For example, designation and oversight of professional training facilities such as those for nurses (32 kinds of qualifications relating to 25 pieces of laws) were transferred from the Ministry of Health, Labor and Welfare to local governments (Regional Offices of Health and Welfare). Hitherto required central approval (Bureau of Economic and Industrial Affairs of the Ministry of Economy and Industry) of modification of articles of incorporation of a local chamber of commerce was replaced by mere reporting from the local party concerned, and other related matters came to be placed under the jurisdictions of local governments and specially designated large cities. Matters concerning registration and oversight of passenger transport business venture run by private automobile owners that had come under the jurisdiction of a local branch of the Ministry of Land, Infrastructure, Transport and Tourism were brought under the jurisdiction of local governments that desired such an authority transfer. For the cases of those local communities that did not want such an authority transfer, the oversight authority was granted to those adjacent communities that wanted it. Consequently, of all the 96 items of matters that had been recommended by the Commission on Promotion of Decentralization Reform to be transferred to local governments, 66 items or 69 % of the originally recommended items came under decentralization (http://www.soumu.go.jp/main_content/000327098.pdf).

As to transfer of administrative matters and power from prefectural governments to lower autonomous communities, by the Second and Third Package Laws, 169 items were recommended to be transferred, of which 113 items or 67 % of the originally recommended items for transfer were actually transferred downward (http://www.soumu.go.jp/main_content/000327098.pdf).

The transferred administrative matters and power comprise those relative to visit and guidance for premature babies, grant of medical service to premature babies, approval of ownership transfer of farmland, guidance and oversight for household item sales business, determination of city planning, and incorporation of specific nonprofit legal entities.

As for transfer of matters and power from local governments to designated cities, together with the cases of transfers from central to locals, the Fourth Package Law realized the following cases of transfers: cost bearing by the prefecture for expenses of public junior high schools, expenses of teachers salary, determination of admissible number of students for junior high schools and number of classes to be run, authorization of opening a new hospital with more than 20 beds for inpatients, license for manufacturing explosives, and license for manufacturing high-pressure gaz. Overall, of those 64 items of matters that had come under the review, 41 items or 64% of the original items were transferred to the lower levels of administration (http://www.soumu.go.jp/main_content/000327098.pdf).

- Review of Mandating and Framework-Setting

By the First, Second, and Third Package Laws, then existing mandating and frame-setting imposed by the central government on local governments came under review, and the prerogatives for the local authorities to establish their own regulations came to be expanded. This reform was intended for local communities to determine and execute things on their own, through locally determined regulations, and apply their own standards different from those that had been imposed by the central government. According to the Committee for the Promotion of Decentralization Reform, mandating meant "mandating local governments to engage in certain activities to address certain tasks which comprise an obligation to work on planning on certain categories of activities." Framework-setting meant "setting a framework for local activities relative to organization, procedures and judgment criteria" (http://www.cao.go.jp/

D

bunken-suishin/gimuwaku/gimuwaku-index.html).

Out of the total number of 4076 items that had come under the review and recommendation, 1316 items were deemed to require rectification, of which 975 items or 74% of the original number were actually rectified (http://www.soumu.go.jp/main_content/000327098.pdf).

The target matters to be rectified comprised such things as "standards of setting and management of facilities and public facilities;" "consultation, consent, permission, grant, approval;" and "formulation of a plan and its procedures." The thitherto legally required standards of road structure and required conditions for residing in public housing facilities and such other standards for managing public facilities and assets were turned over to local regulations. The requirements for the locals to consult with the central government and notify and report thereto were abolished. As to planning and modification of planning on different matters, the hitherto required prior approval by way of consultation with the central minister or local governor concerned was now replaced by post-factum reporting. The mandatory consultation with the minister and the governor concerned for a case of decision on or modification of a planning was abolished. A number of rules on planning and formulation of fundamental policies and their application procedures were either abolished, curtailed, or incorporated into a larger legal framework or simply relegated into a category of desirables.

### Bolster Local Financial Basis: "A Three-Way Reform"

In the national account settled for the fiscal year 2014, the total revenue of national tax and local tax amounted to 94.6 trillion yen. About 40% of the revenue or 36.8 trillion yen was accounted for by local tax. Of the total expenditure by the national and local governments that amounted to 167.8 trillion yen, local expenditure represented approximately its 60% or 97.8 trillion yen (http://www.soumu.go.jp/iken/zaisei/28data/2016data/28010000.html).

This illustrates that despite the rectified central vs. local relations into equal/cooperative ones, the tax revenue sources distribution ratio remains 6 for the central and 4 for locals, while the expenditure ratio of 4:6 remains, which requires further improvement.

The gap between local revenue and expenditure has long been covered by two main additional revenue sources: (1) Locally transferred national tax (which local governments can use freely). Part of national tax revenue is transferred to local governments with a view to adjusting local discrepancies in financial conditions arising from differences in degrees of economic development of local communities. This financial support from the central government is intended for standardized administrative services to be delivered in the local communities. The transferred tax revenue is composed of 33.1 % of national income tax and national corporate tax, 50% of alcoholic beverage tax, 22.3% of sales tax, and the total amount of local corporate tax. (2) National subsidies or specified resources whose spending purpose is predetermined and locally issued public bonds (http://www.soumu.go.jp/english/lpfb/index.html).

"The Solid Policy Plan 2002" enunciated in June 2002 reviewed comprehensively the three-way tax revenue distribution policies of national coffers subsidy, tax transfer, and cession of tax revenue sources. The government aimed to finalize within a year a reform plan with a specific road map. Conforming to this policy direction, a base plan called "a three-way reform" on administrative and financial structures and policies was presented by the then Prime Minister Koizumi to the Council on Promotion of Decentralization Reform. But regarding the issues of abolition or reduction of local ventures dependent on national subsidies, the commission failed to reach an agreement among its members. The deliberation left stalled in confusion, and the task of developing a specific method to address this issue was turned over to six local bodies. The central government and local governments were to discuss directly a forthcoming proposal from the six bodies over the table of the Council on Economic and Fiscal Policy.

Consequently, from 2004 to 2006, approximately 4.7 trillion yen of national coffers subsidy

and 5.1 trillion yen of locally transferred tax revenues were, respectively, curtailed, which resulted in about 3 trillion yen of tax revenue source transfer from the central to local governments.

The essential objective of the three-way reform plan was to expand the latitude of local autonomy through revision of the national coffers subsidy system and to strengthen the basis of local autonomous public finance by ceding tax revenue sources from central to locals. But it turned out that the degree of local latitude and discretion did not increase as much as expected. Abolition of national coffers subsidy which was to bring a new revenue source to enable transfer of tax revenue was mostly postponed, while the portion of central subsidy was reduced and central intervention in local affairs persisted. An additional blow was dealt to local governments with the curtailment of locally transferred national tax. These developments seriously damaged those local governments with weak financial underpinnings. The series of reformative attempts simply ended up in widening the gap in financial strength among local governments.

After all, the consequences of the three-way reform attempt confirmed anew how much it would be difficult to restructure the existing system for the central government to intervene in local administration by way of financial control. Central ministries raised strong objections to the proposed reform plan on national coffers subsidy as it would call for an in-depth review of central versus local authority delegation and central intervention in local affairs. Also there arose an internal dispute between the Ministry of Finance and that of Internal Affairs and Communications, the former calling for curtailment of locally transferred tax from the central government and the latter demanding more of such transfer to local governments. This interministerial difference of views contributed partially to hampering the projected in-depth reform.

## Conclusion: A Decentralization Reform yet to Be Achieved

The report, compiled in June 2014 by the Prime Minister's Office through a series of deliberations at the "Advisory Council on Decentralization Reform" and titled "Create autonomous local governments and communities that can feature their respective individual traits – Perspective of consolidated decentralization reform," recapitulated what has been done over the past 20 years in the way of decentralization reform and set forth what steps are yet to be pursued along the same lines (http://www.cao.go.jp/bunken-suishin/soukatsutotenbou/soukatsutotenbou-index.html).

The report cited three items as positive results of the past reformative activities: 1) abolition of the system of delegated functions, 2) new rules set on central intervention into local affairs, and 3) implementation of a series of deregulations. The report raised as prioritized issues to be addressed relative to the decentralization reform, further transfer of central authorities to locals, further deregulations, establishment of autonomous and independent local financial basis, expansion of local residents' autonomy, and such other matters that the thitherto conducted reform plans had failed to fully address. The report also emphasized the need for further decentralization reforms commensurate with different local circumstances. The thitherto pursued reform policy line applied uniformly across the country, led by the central government, was deemed yet to be converted into a new reform policy line more commensurate with different local features and locally arising issues. As to specific methods to promote such reform measures, the report proposed such approaches that may enable selective central-to-local transfer of authorities in response to local initiatives.

As shown in the report, what should be prioritized most in the yet to be implemented decentralization reform is establishment of financial autonomy on the part of local governments. Under the circumstances of administrative and financial predicament at both national and local levels, further attempts are called for to address in-depth the issues of tax revenue source transfer, national coffer subsidy, and uniform revision of the system of locally transferred national tax. By further streamlining of the categories of centrally subsidized local ventures or by rigorous reassessment of subsidy grant conditions, some financial leeway must be created for the proposed

transfer of central tax revenue to locals. Regarding the locally transferred central tax, the required total transfer amount must be stably secured in such a way that both the function to secure revenue source (for every local government to secure necessary revenue sources to maintain a certain level of administrative service) and the function to adjust different public financing capacities (among local governments with different financial conditions) should be adequately exercised.

Moreover, for continuation of the current decentralization reform, the so far shelved issue of autonomy of local residents must be urgently addressed. The so far implemented central-to-local authority devolution and deregulations increased the extent of autonomous decision-making by local governments and the accompanying wider responsibility on their part, which all led to an increased degree of local autonomy. But for the local governments to exercise their own locally appropriate and effective decision-making, they must foster human resources conversant with local conditions and equipped with special knowledge and technologies. Execution of locally conceived policies should likewise require competent locally reinforced human resources. Another urgent task should be for the local governments not only to strengthen local legislatures or assemblies but also to broaden chances for the local residents to participate in the local policy formulation process. It is also essential to promote cooperation between local authorities and residents in the process of policy implementation so as to establish a system whereby local people can participate in assessing and rectifying locally run public services and policies.

## Synonyms

Decentralization; District chief executive; Local governance; Partisan

**Definitions**: Decentralization involves the transfer of political authority, power, and resources from the central government to local spheres of government. In Ghana, it involves transfer of political authority to metropolitan, municipal, and district assemblies.

**Local governance**: A political subdivision of a nation state, which is constituted by law and has substantial control of local affairs, including the powers to impose taxes or to extract labor for prescribed purposes. In Ghana metropolitan, municipal and district assemblies are by law mandated to control local affairs of the citizens

**Partisan:** Is a strong support of a group of people for political party activities directed at the

success or failure of a scheme or a plan.

**District Chief Executive:** District Chief Executive is the local government. In Ghana, District Chief Executive is appointed by the president; therefore, he is the local representative of President and expected to promote the vision of the President and local people

## Introduction

A remarkable development in developing countries in the last three decades has been the decentralization of government, where power is devolved to lower tiers of subnational structures as a means to promote democracy, governance reforms, and inclusive growth. Decentralization is basically described as a set of policy reforms aimed at transferring responsibilities, resources, or authority from higher to lower levels of government (Falleti 2004). Kauzya (2007) has argued that the search for inclusive and participatory governance has given impetus to the decentralization agenda as it provides local communities the opportunity to shape their destiny.

Because of the popularity of decentralization, many studies have been conducted to examine both its determinants and impact with mixed results as many of the studies ignore the role of political institutions (Bowen and Rose-Ackerman 2003). More than five decades ago, Riker (1964) observed that political parties exercise a decisive influence over the distribution of fiscal power between state and the national government. Riker (1964), in his classic study reported that the success of federalism depends on two key factors: the extent of subnational control by the center and the strength of national parties. However, these issues have not been given the desired attention in much of the literature on Africa. These issues motivate the study to contribute to the debate on the role of parties in the decentralization process.

In Ghana, the Local Government Act, 462 of 1993 seeks to achieve the autonomy of district assemblies through a non-partisan Assembly as specified in the mode of elections to the Assembly (Section 7 of the Act):

A candidate seeking election to a District Assembly or to a lower local government unit shall personally appear before the electorate as an individual and shall not use a symbol associated with a political party. A political party shall not endorse, sponsor, offer a platform to, or in any other way campaign for or against a candidate seeking election to a District Assembly or to a lower local government unit. A candidate who contravenes subsection (1) commits an offence and on conviction the Electoral Commission shall cancel the nomination of that candidate.

Consistent with the neoclassical approaches to the allocation of authority, decentralization is treated as a depoliticized issue, which according to Rodden (2006) is reducible to the establishment of the optimal number of territorial jurisdictions. Obviously, understanding the role of parties in decentralization is important, since decentralization touches on the core of politics (Tarouco 2016; Hopkin and Van Houten 2009). This study is motivated by the fact that the agency expected to synchronize the policies of national and constituent administrations is a political party, however not much focus has been given to this in the context of decentralization. This paper contributes to the decentralization research agenda by systematically exploring the partisan links between national and state politicians on decentralization from the perspective of citizens. This will provide recommendations as to how to improve the decentralization process in African countries more generally, and Ghana more specifically as one of Africa's most committed to the decentralization process. The rest of the study is organized as follows; the next section presents the literature review after which the methodology is described, results are then discussed and policy implications and concluding remarks offered.

## Literature Review

Two main perspectives (First and Second Generation Theories) underlie the benefits of decentralization. The First Generation Theories (FGT) of decentralization (Oates 1972; Tiebout 1956) analyze the benefits and costs of decentralization from the standpoint of resource allocation while ignoring agency costs. The basic assumption is that local governments have the proximity advantage, which translates into informational advantage for better service delivery. Decentralization is, therefore, expected to lead to better public service provision because local government officials are better positioned in delivering services that match local preferences (Oates 1972). The inter-jurisdictional competition, associated with decentralization, according to Tiebout (1956) gives opportunity to citizens to vote and move to localities that meet their needs in terms of public goods provision and tax incentives.

The Second Generation Theories (SGT) of decentralization draw from various perspectives including principal agent, theory of the firm, and organization theories. Unlike the FGT which assume that both local and central government officials are benevolent social planners, the SGT show that government officials at all levels are constrained by political incentives that often do not lead to maximization of citizen welfare (Weingast 2014; Hanke and Heine 2016). While the FGT provide a normative agenda, the SGT give a positive theory of decentralization.

Opponents of decentralization, however, argue that the benefits of decentralization have been overstated and, in certain cases, may lead to negative economic outcomes especially in African countries with weak political institutions. For example, inter-jurisdictional competition may lead to what Zodrow and Mieszkowski (1986) describe as race to the bottom, where productivity-enhancing public goods are underprovided by the subnational units in an effort to attract taxable but mobile factors of production. Thus, the SGT deal with political economy of capture and corruption and agency costs issues that are ignored by the FGT. It is not surprising, therefore, that while some authors support the view that partisan politics is good for decentralization, others argue otherwise. Empirically, Harbers (2010) reports that political and fiscal decentralization have a robust negative effect on nationalization through different model specifications and trade-offs between decentralized governance and nationalized party systems. Tarouco (2016) demonstrate that when political parties manage electoral competition, there is a greater likelihood of concerns about the fairness of the election.

## Research Methodology

The study is a cross-sectional study based on a national sample survey of 3018 citizens of voting age from the ten regions and 72 districts of Ghana. The survey sample size and distribution is captured in Table 1.

A total of 72 research assistants were recruited and trained to administer the questionnaires in the respondents' own language of choice.

## Findings of the Study

The discussion of the findings of the study is divided into two main parts, descriptive and logistic regression results.

## Descriptive Results

Two substantive questions guided the study. They were: should the DCEs be elected or appointed?; and is the District Assembly (DA) partisan or not? Over 68% of the respondents indicated that the DAs were already partisan and only 961 (31.8%) respondents held the view that DAs were non-partisan. The respondents were then asked to give their personal opinions on whether or not the DAs should be partisan; the responses are presented in Table 2.

The results show that while over 80% reported that the DAs were already partisan only 18% suggested that the DAs should not be partisan. The findings also show that only 20% want the DAs to be partisan and 25% reported that partisan politics at the local could help to enhance national cohesion. Interesting though is the observation that nearly 70% of the

| Partisan politics at local level could enhance national cohesion | 25.0 | 57.7 |

Source: Survey Data, 2018

respondents indicated that political parties at the local should be strengthened as a means of promoting democracy. The reason for this finding per informal discussions with the respondents is that promotion of partisanship at the local level could provide an opportunity for building political competencies for those having aspirations of being involved in national politics. It is worth mentioning that both those who support partisanship and those who argue against it at the local level agree that some degree of partisan politics already exists in the MMDAs. Additionally, 69% of respondents were of the view that the District Chief Executives should be elected while 31% said they should be appointed.

The study's findings are supported by a recent survey by the Center for Democratic Governance (CDD-Ghana) which reported that the majority of Ghanaians would want the MMDCEs to be elected. The survey which was conducted in September 2017 is the Round 7 findings on local government and the election of MMDCEs**.** The survey which sampled 2400 respondents showed that 69% of Ghanaians want the position of MMDCEs to be elective, while 25% prefer the current system of appointment of MMDCEs to be maintained.

The regional analysis of the data helps to provide more information on the issues discussed (see Table 3).

Source: Survey Data, 2018

The results show that many of the respondents of the more developed and cosmopolitan regions (Greater Accra Region (GAR), Ashanti Region (ASR), Northern Region (NR)) support the election of MMDCEs than the least developed regions (Upper East Region (UER), Upper West Region (UWR), and Central Region (CR). The assumption is that the more developed the locality, the more people are willing to take their lives into their own hands and have less trust in government. The results also show a similar pattern on the issue of whether the local government should be partisan or not. The poorest regions of the country (UER and UWR) were more comfortable with the status quo.

The logistic regressions (not shown here but available upon request) also show some interesting findings. The results show that religion and location of constituency (rural and urban) determine the outcomes of the respondents in terms of the institutional arrangement for decentralization. Non-Christian religion influences the perception of being partisan or not. It is significant at 5% and the odds ratio is between 1.016 and 1.43. The results suggest that those in rural areas are more likely to accept the partisan nature of district assemblies. On the election versus appointment question, the results show that religion and age of respondents were key determinants of the choices made. The results show that non-Christians are likely to perceive that elections are better than appointments by the President. Additionally, age is a critical influence on whether one supports the status quo or would want the MMDCEs to be elected. The results show that older (41–60+) people in Ghana are more likely to suggest that the DCE should be elected compared to those 40 years and below.

## Policy Implications and Concluding Remarks

The study examined the role of political parties in the decentralization process of Ghana. The results show that the majority of the respondents believe that the process is already political, which is not consistent with the spirit of the 1992 Constitution that seeks to establish a party-free local government system. The findings provide two main policy implications.

First, the review of the literature and findings of the study show that the very context of decentralization is political; therefore, any discussion of decentralization as a party-free process would be

inadequate. Obviously, the ability of national executives or subnational politicians to shape decentralization is determined by the structure of political parties, which provide the medium through which such bargaining takes place. If indeed, decentralization is a process that relocates power from the center to the subnational to promote not just efficiency but also citizen engagement in providing services that best meet their needs, then it is imperative that political parties as mobilizing agents should be allowed to play a role in the process.

Secondly, decentralization provides an opportunity for the local government and civil society to engage in such a way as to help in the maintenance and development of democratic institutions. In many African countries, the desire for change necessitate the strengthening of political parties because pressures for internal organizational changes are more likely to take place where subnational party elites gain some form of independent control of zones of uncertainty in the electoral arena.

On the other hand, democratization and increased political competition can create pressure to decentralize, and the resulting political openings could provide opportunities for political entrepreneurs and newly organized social groups to challenge not only the inefficiencies of centralization but also its political exclusiveness. The indication is that although decentralization may promote participation and reduce the likelihood of dictatorship, it may also lead to authoritarian enclaves in peripheral regions if the central government and society are too weak. The findings of the study contribute to the literature on multilevel governance and conclude that a party-free analysis is incomplete as it ignores the political context of decentralization. Political parties, therefore, are very important actors that establish the linkages between the political institutions and, more importantly, national stability is dependent on the strength of political parties. Obviously, the essence of decentralization is rooted in a partisan logic, which invariably explains the very timing and nature of the decentralization process. Further research is needed to ascertain the moderating of the role of demographic and economic factors on the perception of people on the institutional arrangement for Ghana's decentralization process.

# Decentralizing Governance

Giorgio Oikonomou
Department of Political Science and International Relations, University of the Peloponnese, Corinth, Greece

## Synonyms

Decentralization; Decentralizing authority; Decentralizing power

## Definition

Decentralizing governance is the process of promoting the role and enhancing the status of – principally – formal subnational institutions, namely local and regional authorities, in the policy process, by transferring responsibilities and – financial and human – resources from central state authorities to them.

## Introduction

Since 1990 onwards, the term "governance" has become a highly popular one (for an etymology and genealogy see: Jessop 1998, pp. 30–31). However, there has not been a single definition of the concept so far; instead, various uses have been proposed (Rhodes 1996). Generally, it has been suggested that the concept denotes "a change in the meaning of government" which allows for "a *new* process of governing, or a *changed* condition of ordered rule; or the *new* method by which society is governed" (Rhodes 1996, pp. 652–653; italics in original). In the same vein, it has been argued that it refers to "patterns that emerge from governing activities of social, political and administrative actors" (Kooiman 1993, p. 2). From another perspective, governance is about hierarchy in the sense of self-organization, and "co-ordination of independent activities" (Jessop 1998, p. 29), and shortly the "pursuit of collective interests and the steering and coordination of society" (Peters and Pierre 2006, p. 209). A critical component of the concept is the plurality of new actors that can be involved in policy-making processes, a feature which characterize modern states and supranational organizations. Among the new actors involved in policy-making are other than the traditional dominant central state authorities, namely, subnational institutions; in other words, regional and local authorities.

## Governance and the Concept of Decentralization

Governance is not about allocating competences among central and subnational institutions or selecting between centralization and decentralization (Rhodes 1994, p. 151), though the interinstitutional arrangements within states are closely linked with the concept. In this regard, decentralization or, alternatively, the policy of transferring authority and resources from institutions of the central government to regional and local bodies is an inherent and rather latent part of the "ordered rule," and stands for a new governing method aiming at improving the efficiency and effectiveness of public policy delivering. Respectively, the decentralization of governance in essence is related with the process of advancing the role of – principally – formal subnational institutions in public policy-making, by attributing responsibilities and – financial and human – resources to them; in that respect, decentralization constitutes a powerful tool for reorganizing the process of governing, in other words reorganizing governance. The process represents a political choice controlled by central authorities, a characteristic which is rather oxymoron since it may entail some degree of "hollowing out" of the overall power of the central administration. Notably, the decentralization process is characterized by the perceived role and institutional power the center should retain for itself vis-à-vis the role and power that should transfer to its periphery. The greater the degree of power that is transferred, the higher the potential gains for the substate entities in terms of their institutional and administrative capacities; however, this should not be always taken for granted. In times of economic crises, the center may be tempted to shift responsibilities to subnational authorities, yet omitting to transfer sufficient financial and human resources.

In general, in many European countries and elsewhere, decentralization constitutes a central feature of the administrative reform agendas. By and large, decentralization has been considered a tool for promoting local autonomy and democracy, while it has also been linked with the new public management literature (Pollitt 2005, pp. 371–372) according to which economy, efficiency, and effectiveness (the tree "E"s) should be the driving forces of public institutions. Regarding a working definition of the term, it has been argued that

providing one depends upon the time period and the political context of a country (Loughlin 2007, p. 393). According to the World Bank, decentralization results in the transferring of administrative and economic power as well as responsibility for governance issues and public service delivery from a higher administrative level to a lower one (World Bank 2008, p. 31).

## Factors Inducing Decentralization

A main exogenous factor favoring decentralization initiatives is the supranational (globalized) economic pressures and calling for efficiency and effectiveness of the public sector as a whole. In conjunction with the external environment, domestic national policy preferences dealing with the type and mode of decentralization, as well as subnational institutions' own interests constitute two significant factors that define the scope and the depth of the efforts for decentralizing governance. In addition, the participation of countries in international or regional formal organizations may induce pressures for institutional (re)arrangements in favor of decentralization. In this context, the European Union stands as a critical pattern in terms of posing adjustment pressures to its member states, that favors decentralization efforts (John 2000, p. 878; Loughlin 2007, p. 394) and advances another model of state reorganization which is closely linked with the promotion of the concept of multilevel governance (Hooghe and Marks 2001; Piattoni 2010). In that respect, the relationship between decentralization and multilevel governance can be characterized as a causal one, since it provides explanations on how the former (decentralizing governance) can really affect – in terms of fostering – the latter (multilevel governance).

## Types and Modes of Decentralization

From a theoretical point of view, in the literature of decentralization, there has been proposed a variety of different types (for instance, see: Kuhlmann and Wayenberg 2016; Pollitt 2005; Shabbir-Cheema and Rondinelli 2007; Saito 2011; World Bank 2008). The most prominent types are political, administrative, and fiscal decentralization, whereas another pattern is the organizational form of decentralization. Broadly speaking, the form of political decentralization relates with an increased institutional autonomy and power derived from directly elected leadership for the substate entities. The type of administrative decentralization entails mainly the transferring of competencies from the central to the subnational level. Regarding fiscal decentralization, this type is linked with the fiscal federalism literature, and stands for the shifting of financial resources and decision-making power for controlling local taxes to subnational institutions. In addition to the three aforementioned types of decentralization, there are two other complimentary forms, namely, the territorial and the organizational decentralization. The former indicates the transferring of responsibilities to local and regional authorities for exercising them within a predefined territorial area; the latter form of decentralization suggests that tasks are decentralized within a public service (i.e., vertically-hierarchically) or between public services (i.e., horizontally, that is from old to new administrative bodies).

Due to the fact that the boundaries of the different types of decentralization are often blurred, some degree of overlapping may de facto occur. In addition, one category does not necessarily presuppose the (pre)existence of another. In that respect, a decentralization initiative may take the form of a radical reform effort or can simply aim at partly altering some features of the institutional or administrative environment of the subnational setting.

For example, administrative decentralization allows for deconcentrating state power, a feature which is also traced in organizational decentralization. In addition, one category may exclude critical elements of another that should have been taken into consideration. For instance, political decentralization may not always entail fiscal autonomy (Ezcurra and Rodríguez-Pose 2013, p. 389), thus prolonging subnational authorities'

dependency on central government subsidies and subsequently raising questions about their institutional autonomy altogether, despite the initial reform effort for providing more political autonomy.

Along with the proposed decentralization types lays the mode of implementing them. De-concentration, delegation, and devolution of power stand for the main policy tools that determine the depth of decentralization (Saito 2011; World Bank 2008, p. 32). De-concentration denotes that central government functions are to be implemented by state personnel, thus allowing for the central authorities to focus more on policy formulation issues rather than implementation (Hague and Harrop 2004, pp. 505–506). Delegation is related with the transferring of competences to and the respective implementation by local government authorities. Finally, devolution is considered to be the most powerful mode of decentralization, due to the fact that legislative power is attributed to subnational institutions along with authority for autonomous decision-making. The combination of the types with the modes of decentralization shows that devolution is mostly linked with political and fiscal decentralization, whereas organizational and territorial decentralization suggests deconcentration and delegation measures; the latter also pertains for administrative decentralization. The combination indicates that the scope of decentralization is contingent upon the depth of its mode: the greater the depth (i.e., devolution), the higher the scope (political decentralization), whereas the opposite does not seem to be always the case.

## The Pros and Cons of Decentralization

When considering the advantages and disadvantages of decentralization, it must also be taken into account the argumentation in favor and against the concept (Pollitt 2005) since the results are not always positive for citizens. Decentralization literature has provided contradictory findings regarding the overall implications (for a discussion see: Kuhlmann and Wayenberg 2016, pp. 235–238). In that respect, it has been suggested that when a political decision backs decentralization reforms, some critical dimensions should be taken into thorough consideration such as effectiveness, efficiency, coordination (vertical and horizontal as well), democratic control, and equity as well (ibid., pp. 237–238).

In broad terms, on the side of the spectrum that favors decentralization initiatives are reasons for (potentially) improving the responsiveness of governance since local authorities are closer to citizens' real needs and have direct access to their needs, as well as enhancing the quality of democracy by increasing the proximity of constituencies with political leaders and engage citizens in political affairs. In the same vein, territorial competition creates pressures for improving the delivery of local public policies. The counter-argumentation treats centralization as the key-element for achieving economies of scale, utilizing expertise found more easily in central authorities, allowing for single and consolidated public policies strategies, as well as treating all citizens equally rather than in diversity. On the side of criticism are also found arguments about obstacles in citizens' free movement and choices about continual resettlement; moral hazard issues that arise in cases where subnational authorities shift their (i.e., financial) burdens and/or policy failures to central authorities easily as well as phenomena of local élit capture by strong clientelistic networks operating at the territorial level of governance; greater income inequality between and even within rich and poor territories. In this respect, the nexus between decentralization and centralization constitute a "political enigma" when a policy decision regarding the architecture of governance – that is decentralization or re-centralization – has to be reached, since there is not a single solution that fits with every given political process and system of governing.

## Conclusion

In a nutshell, governance is about a new process of governing and a method that societies

are governed, whereas decentralization is related with transferring authority and resources from institutions of the central government to regional and local institutions. Respectively, decentralizing governance is the process of enhancing the role of substate entities, that is, local and regional authorities in the policy process. On the one hand, decentralizing governance has certain advantages such as promoting democracy and accountability as well as increasing the effectiveness of public policies due to better information about the local needs; on the other hand, it may entail costs such as regional competition, moral hazard issues, and local élite capture by local vested interests. In addition, there have been proposed various types and modes of decentralizing governance which better describe the scope and depth of the degree of decentralization within a sovereign state. All in all, decentralizing governance constitute a "political enigma" since there is not a single solution that fits with every given system of governing. Thus, there is not a straight and unitary answer when dealing with trilemmas like centralizing, decentralizing, or recentralizing governance, but it rather depends on preexisting institutional arrangements, political priorities, and citizens' real needs.

# Decision Making

David Landsbergen and Jos C.N. Raadschelders
John Glenn College of Public Affairs, The Ohio State University, Columbus, USA

## Synonyms

Agreeing to do; Bounded to do; Obliging to do

## Definitions

A *decision* is the moment in time between a period that various alternative solutions to a problem are considered on the one hand and the period that people attempt to implement what they determined to do on the other.

*Decision making* (DM) is a process of, hopefully, careful consideration of the issues, resources, and feasibilities in the (re)solution of a problem.

## Introduction

Decisions are central to human activity. They are made all the time, by individuals, by groups of people, and by people in organizations and in societies. The scholarly literature on DM has increased exponentially since the Second World War, and it has particularly grown in economics and psychology. The references at the end of this entry cannot be complete, but they will provide the reader an entry into the recent literature.

## Importance of Public Sector Decision Making

Decision making in the public sector is particularly important for several reasons. First, and perhaps foremost, government is the only institution in (democratic) society that has the authority to make binding decisions on behalf of all residents in a country. Second, only government can marshal the financial and personnel resources needed to deal with society-wide problems and concerns. Third, government often deals with so-called "wicked problems" (Rittel and Webber 1973) that nonprofit and private actors do not deal with because (a) the both these do not have the decision making authority and resources government has and (b), for the latter only, because it is not profitable. To put this differently, it is governments especially that deal with DM under risk (i.e., when the probability of an outcome is knowable and can be calculated) and uncertainty (i.e., when the probability of an outcome is undetermined and thus unknowable). This element of DM regarding wicked problems will be further explored in the next section. Fourth, only government can act as a neutral decision maker in conflicts between citizens and in disagreements between citizens on the one hand and private/nonprofit organizations on the other. Finally, fifth, public sector decision making is unique in the sense that government in a democracy restrains its use of decision making power vis-à-vis citizens, interest groups, and private and nonprofit organizations and companies. That is, *chapeau* Locke, a democracy can only thrive when all institutional, organizational, and individual actors exercise self-restraint so that others will be free.

In this entry, we focus on public sector decision making as manifest at the individual, group, (inter)organizational, and societal levels. Before we do so, however, the nature of problems in public affairs needs to be briefly explored. There will be a few references in the text, but the references at the end will provide the reader with entries in the literature that was consulted in preparation for this encyclopedia entry.

## Nature of Problems in Public Affairs

The most simple prescriptive models of "good" decision making involve, more-or-less, five basic steps: (1) identify (or agree on) the problem, (2) identify the goals, (3) define alternative solutions, (4) gather information, and (5) analyze which alternative is the best. With some variation, this is the approach taught to school children from the time they enter school until they graduate. It is the most common norm by which decision making is judged. While useful in simple decisions, it becomes clear, with just a little inspection, that this model does not apply to most of the bigger decisions in public affairs.

Each of these "ideal steps" is now compared against the reality of public decision making. They are more aptly characterized as "wicked problems" that require additional tools to support good decision making. First is the assumption that

problems can be easily identified, or as a second-best solution, agreed upon. In reality, decision makers really begin with "problematic" situations – something hurts or is painful. These problematic situations somehow need to be diagnosed before resources and managerial attention can focus on the specific policy or managerial interventions that need to take place. Poverty is problematic. Is the problem the lack of job opportunities? the lack of a work ethic? lack of education or job preparation? psychological in origin? the result of other social problems like the inability to obtain child care? Aside from the problem of "clearly identifying the problem," there is the added complexity that citizens have differing values as to what is important. Politicians are keenly aware of the power of framing a problem as it will dictate the range of allowable solutions, and ultimately the goals being sought (Schattschneider 1960).

There is also the added difficulty that there are interdependencies, such that many of these candidate explanations may have a role. A closely related characteristic of public problems is that they are complex and are interdependent so that actions taken to improve upon one problem do not always consider the effects of, or effects on, other attempts to deal with public problems and so lead to "unintended consequences" (Merton 1936). Finally, these problems are dynamic – their intensity and direction change over time. In a strict sense, decision makers already fail in the first step, clearly defining the problem. However, something must be done and so decisions about the problem are made without a clear unanimity of what the problems are. Public problems need special tools and institutions to agree on what the problems are.

Moving on to Step 2, defining alternatives to the problem, suffers from many of the same problems as in Step 1, defining the problem. In addition, there are time, resource, and cognitive limits on the ability to identify the many possible alternatives. There is also an urgency that decisions should be made soon so that the problems can be ameliorated. As a result, big assumptions are made about what facts are important, how important the problem is, and how many resources are to be devoted to the problem. Step 2, therefore, is not perfectly completed because it is never clear whether all the important alternatives are identified.

These resource constraints also limit how much decision making can do in Step 3. In addition, there are also limitations on the data that are available. Even if the resources are there, very often the data are simply not there or are not collected in a form that it is useful. In the public sector, this brings up the problems of good data management, which is only recently being seen as a necessary prerequisite to decision making. As will be discussed later, society is changing in its "taste" for the need for good information planning and management as well as availability of the tools to accomplish this. Limitations in human cognition also limit the quality of the analysis (discussed in individual decision making, below).

Finally, public decisions are most often judged by short-term outputs and to lesser degree by longer-term outcomes (think here several years if not decades). Now, given their inherent uncertainty, the quality of public decisions should also be judged by the process by which they were made, namely and ideally with all stakeholders involved. Government is not a private business.

In summary, while the public is very well educated as to the basic steps in decision-making, the characteristics of public problems require significant departures from this ideal model. The difficulty is when the public judges these departures not as a practical accommodation, but as flaws in the decision-making process.

## Taxonomies of Decision Making

As mentioned in the introduction, the literature on decision making is vast and it is therefore no surprise that it has been organized in a variety of ways. One of the most common distinctions is that between normative, descriptive, and prescriptive theories (Bell et al. 1988). *Normative theories of DM* assume that decisions are predominantly made on a rational basis. Rational models are

based upon "ratio-", the Latin for "reason." Rational models must articulate an explanation that links a set of facts logically towards a conclusion. Rational models will vary according to the norms that are posited for what a good decision looks like. The best-known example is the simple problem-solving approach discussed above, the so-called rational-synoptic model (also known as the expected utility model) that holds that decision makers have complete understanding and knowledge of the problem at hand, the costs and benefits of alternative solutions, and can thus determine the best and only possible solution. This is the model that has informed economic theory during the nineteenth century and for much of the twentieth century. In addition to the rational-synoptic models, there are additional normative models that have their own set of norms and logics by which decisions are made including technical rationality where administrators make decisions based on administrative rules, legal rationality, and political rationality (Murray 1986). Each of these kinds of rationality is also important to public affairs but is not addressed here because of page limitations.

Since the 1960s, the "faith" of economists in rational decision making has been challenged by psychologists giving rise to behavioral economics and behavioral psychology. The focus of these *descriptive theories of DM* is on how people actually make judgments and decisions. Researchers in this tradition are concerned with actual behavior and reflective judgments, seeking to test these behavioral assumptions empirically. Finally, *prescriptive theories of DM* make an effort at outlining how people can make better decisions by making them aware of (a) the limitations of human judgment and (b) practical problems of implementing policies (Table 1).

In the table below, the various theories about decision making are organized on the basis of the distinction between individual, group, organizational, inter-organizational, and societal levels. As far as we know, those are not really theories that specifically address DM at societal level. However, (neo-)institutional theories suggest that individual behavior is very much influenced by environmental factors and trends.

## At Individual Level

Many DM-theories focus on the individual level and they can be placed on a continuum from completely rational to completely irrational. Economic man theories assume that decisions are made on the basis of complete information about (a) the nature of the problem that needs to be solved and (b) the costs and benefits of all possible alternative solutions. This leads automatically to the one best decision. That is, there can be only one best decision, irrespective of who the decision maker is. Thus, the economic man model assumes that decisions have no political content. This type of theory has come under scrutiny especially since the 1940s. Herbert Simon was the first to question the omniscience implied by the economic man model and with his concept of "bounded rationality" emphasized that decisions were never maximizing, merely satisficing (am eighteenth century Scottish word: a conflation of satisfying and suffice). Also, decision makers should focus on facts and leave value judgments to elected officeholders and their civil servants.

Within the study of public administration, various other normative models have been suggested, but they all assume that some degree of rationality is possible. Lindblom's incrementalism is a DM-model where decisions are made as successive limited comparisons and the best example is the cyclical nature of the budget process. Yehezkel Dror developed his normative-optimum model in response to, what he felt to be, Lindblom's conservative view on DM. He advocated rationality should be enhanced by explicating goals and searching for new alternatives, while at the same time clarifying the values upon which a decision is pursued. Dror's model is closer to Simon's. Amitai Etzioni's mixed-scanning model sits somewhere in the middle of the continuum between rational and irrational models. He argues that some decisions are fundamental and contextuating, setting the tone for many bit-by-bit decisions. His model is thus something of a compromise between Simon and Dror on the one hand and Lindblom on the other. These three models focus on the nature of decisions as well as the DM process, and not on the

**Decision Making, Table 1** Approaches to decision making (expanded from Koppenjan and Klijn 2004, p. 44)

| Level | Nature of decision making | Central insights | Approaches/authors |
|---|---|---|---|
| Individual as economic man | Individual (central) decision maker assesses alternatives on basis of utility and/or profit maximization | Rational-synoptic decision making; social development is aggregate of individual behavior | Neoclassical economic theory, economic man; Gaming theory |
| Individual as administrative man | Individual (central) decision maker assesses alternatives on basis of his own and/or group objectives and upon as complete information as possible | Information-processing and digesting capacities are limited: Bounded rationality | Critiques and amendments: Incrementalism, Lindblom (1959); satisficing, Simon (1947); mixed scanning, Etzioni (1967); normative-optimum model, Dror (1964); public choice, Downs (1967); Niskanen (1971); heuristics and biases, Tversky and Kahnemann (1974); Thaler (2015); Hastie and Dawes (2010); Kahneman (2003); (Thaler and Sunstein 2009) |
| Group | Decisions are made in groups; group processes influence course and outcome of decisions | Group process influence information provisions, value judgments and interpretations | Social-psychology: Groupthink, Janis (1982); Nondecision making, Bachrach and Baratz (1970); |
| Organization | In modern societies, decisions are made in and by organizations | Organizational filters and intra-organizational contradictions influence information processes and the decisions based upon them | Garbage-can model, Cohen, March and Olsen (1972); organizational process and political-bargaining or governmental politics model, Allison (1970) |
| Inter-organizational | Decision between mutually dependent organizations are taken in horizontal settings with a highly "disjointed" nature | Subjective perceptions, power relations, dynamics and coincidence influence information and decision making | Disjointed incrementalism, Lindblom (1959, 1979); game approach, Allison (1970), Crozier and Friedberg (1980); multiple streams model, Kingdon (1984). |
| Societal | Decision making is influenced by the societal context | Institutions matter; individual and organizational behavior are highly influenced by the cultural, social, economic, political, historical context | (neo-)institutional theories, Peters (2012) |

individual who makes the decision(s). Downs and Niskanen's ideas are different in that they specifically look at the decision maker, and then especially at the bureaucrat who is out to enhance her/his own influence through successfully negotiating larger budgets and/or more personnel. However, their public choice theory of bureaucratic self-serving behavior (as presaged by "Brutus" in the Anti-Federalist Papers) is not corroborated by empirical evidence. That is to say, all people will now and then engage in self-serving behavior and it is thus not a behavior characteristic for career civil servants. Furthermore, it has been shown that civil servants are perfectly capable of making decisions resulting in budgetary and personnel cuts (Dunleavy 1991).

Since the 1970s important contributions to decision making have been provided by scholars working in behavioral psychology and behavioral economics. The work by Israeli psychologists Amos Tversky and Daniel Kahnemann has been very influential. They pointed out that DM is a process more grounded in heuristics and

biases, i.e., mental shortcuts, than many people would like to believe or accept. Heuristics such as the representative heuristics (using resemblance between different object or events), the availability heuristic (estimating likelihood based on how easy it comes to mind), the anchoring heuristic (reliance on the first piece of information available), and the framing effect (influencing judgment by framing, e.g., drug use as health or as criminal problem) are now standard language in decision making theories. Biases are too numerous to list (one can simply google and pages with examples of biases will show up), but each of those shows how people are pattern-seekers and hard-wired into perceiving regularities and imposing structure upon what they perceive. What makes their work important is that decision makers have become much more aware of how ubiquitous heuristics and biases are. Where Simon's bounded rationality mainly concerned human being's limited information storage and information processing abilities, the work of Kahneman and Tversky brought home the message that many decisions are driven by, what Kahneman has called, System-2 thinking that is quick, intuitive, and impulsive. System-2 thinking is much harder, for it concerns doubt and the suspension of disbelief.

The economist Richard Thaler has further expanded the understanding of how much economic decisions are influenced by cognitive limitations, by self-control problems, and by social preferences. One solution to these problems in decision making in the public sector (developed with Cass Sunstein) is that governments should "nudge" people into making better economic decisions (Thaler and Sunstein 2009). However, as Martin Lodge and Kai Wegrich pointed out, this implicitly assumes that a public decision maker actually knows what is best for the individual(s) (Lodge and Wegrich 2014). Lodge and Wegrich thus conclude that "nudge" assumes bounded rationality, but at the same time that the decision maker has a more comprehensive understanding of what is good for the individual. In the view of the authors of this entry, Thaler and Sunstein's libertarian paternalism is reminiscent of Plato's guardians or philosopher-kings.

## At Group Level

While ultimately individuals make the decisions, it is usually through groups that these decisions are made. In an age of increasing complexity and specialization, it is even more important that group decision making be better understood, so that collaborative decision making is managed well.

Assembling individuals into groups can theoretically improve decision making as it increases the variety of perspectives, knowledge, and skill sets that can be applied to a problem. This can lead to alternative ways to view the problem or a more robust evaluation of the facts, analysis, or the outcomes. On the other hand, when individuals enter groups, they bring their individual biases as well inducing new kinds of biasing behaviors. If the advantages of groups are not managed appropriately, groupthink can occur that works to limit the quality of the decision. Rather than providing alternative perspectives, groupthink can reinforce errors instead of identifying and eliminating them. Similar to improving individual decision making, improving group decision making means identifying these biases and managing them with the appropriate tools.

Surowiecki (2005) *Wisdom of the Crowds* recounts a famous experiment conducted by Francis Galton in 1907 that shows the power of individuals working together to make a decision (Surowiecki 2005). The experiment involved having fairgoers guessing the weight of an ox. Surprisingly, in this experiment and many others, it turns out the average guess of fairgoers was more accurate than the individual guesses of individual experts. The important reason this worked, as it turns out, was because the guesses were independent and could count on the individual guesses averaging out towards the expected mean. On the other hand, experiments which involved situations where individuals were influenced by the guesses of others resulted in less accurate predictions. Under the right conditions, people working in groups are quite intelligent. Plainly, groups have advantages over individuals, but it is also true that biases in groups need to be managed to realize their full value.

In group decision-making, some of these biases have come to be known as "groupthink" (Janis 1972, 1983) and they occur when there are strong pressures to conform. Soon after assembling individuals into a group, group norms and identities form and social cohesion develops. While this is a more comfortable state for individuals, these tendencies can also negatively result in pressures to conform, essentially, taking away what individuals can contribute to a group by suppressing controversial or different views, ideas, and values. Counteracting these natural tendencies requires explicit focus on encouraging diverse perspectives to be raised and evaluated.

Another way to think about group decision making is whether the inappropriate use of individual heuristics, discussed earlier, is reinforced or countered by the group. Sunstein and Hastie (2015) review the behavioral decision-making literature to better understand how groupthink occurs. They conclude that too often groups amplify the negative effects of individual heuristics. Individuals indulge in the "planning fallacy" or bias, the inability of individuals to accurately assess their capacity to accomplish things within a time period. Groups also exhibit these same biases.

In conclusion, groups have theoretical advantages over individuals, and under the right circumstances, those advantages can be realized by managing the biases that individuals bring to groups and managing group-level biases. There has been a great amount of empirical research on the large number of individual and groups biases, but some simple management principles and tools have emerged: (1) at the individual level, encourage decision makers to examine their own biases and support their efforts by the provision of information to counter biases and suggest the development of models, and (2) at the group level, encouraging debate and question through "priming" critical thinking, using devil's advocate thinking and "red teams," and tools like the Delphi method (Sunstein and Hastie 2015), as well as other tools like systems dynamics simulation, nominal group techniques, and Q methodologies.

Although Simon's call to have the study of public administration focus on the importance of decision-making occurred almost 70 years ago, widespread understanding of the importance of decision-making to the success of groups has only recently appeared in the popular discourse. Perhaps driven by the ongoing desire to improve policy and management through better evidence and analysis, and assisted by advancements in ITC to collect, store, and analyze information better, the trend towards formal and explicit attention to decision-making will continue and grow.

## At (Intra)Organization Level

Perhaps decisions in the past were made by individuals (think authoritarian or dictatorial rulers), but they were not implemented by that individual. In other words, decisions always were a function of organization. Nowadays, decisions are always made in a specific organizational context. Two theories address this organizational level. The so-called garbage-can model of Cohen, March, and Olsen suggests that decisions in organizations are random and unsystematic, that at any time multiple decisions are made in an organization, and that most decisions are made under high uncertainty. Sometimes this theory is considered to address some degree of anarchy in organizational decision making, and this is especially visible in organizations, for example, with two categories of highly educated professionals such as nurses and doctors in hospitals and professors in universities versus professional administrators (CIO, CFO, CEO).

Another way of looking at organizational decision making was provided by Graham Allison in his analysis of the Cuban missile crisis where he distinguished between three different models, each providing a specific focus on understanding the events of 1962. The rational-decision making model focuses on objectives, rational explanations, clarity of choices, and the organization as a whole. The organizational process model emphasizes routines and procedures (standard operating procedures (SOP)) and sheds more light on the "behavior" and interests of subunits in an organization. The political-bargaining or governmental politics model stresses that the decision making space is limited by the interests of individuals and organizations.

Both the garbage-can model and the three foci of Allison are relevant to understanding intra-organizational decision making. John Kingdon's multiple streams model extends the garbage-can model to the intra-organizational environment (Kingdon 1994). The problem, policy, and politics streams seldom coincide, and when they do the decision maker(s) jump(s) through a policy window. These streams also are not "controlled" by one organization only; there are very few, if at all, policy areas where the authority to make and implement decisions rests with one organization only.

## Decision Making and Society: The Role of Government

Democratic society is about public decision-making through collective action. Democratic governments are creatures of the Enlightenment, a period in which empirical observation, rational analysis, and decision-making are core principles of both the scientific method and democratic governance. Common to both were an expectation that decisions need to be explained, that those justifications be based on evidence, information, and cogent analysis. Individuals could now understand the world and make it a better one through reasoned discussion. Central to the success of science and democracy is a forum by which claims are discussed and adjudicated. The success of democracy is based on an educated citizenry.

Citizens have a choice as to the kinds of fora in which these collective decisions are made: through hierarchies or organizations, markets, and more recently, networks. The question about the appropriate forum in which to make these collective decisions is known as the "governance" question (Thompson et al. 1991).

Interest in making good decisions is now increasing. The claim that we are an "information society" is really another way to say that we are society that needs information to make decisions. There is a push in many professions to make evidence-based and data-driven decision-making. In addition to this cultural shift, there are now ongoing and significant innovations in ITC to collect, store, communicate, and analyze information. Not too long ago, access to good information was the primary limitation on decision-making, but with these exponential increases in the power of technology, the problem is now of decision-maker "information overload" (Toffler 1970) where the new constraint is how to use this information effectively. Now that information access is improving; the new restraint is finding organizational and analytical tools to make sense of this information. There is a growing interest in data analytics and Big Data. Yet, despite the advancements in ITC, public decision-making will always involve the collective evaluation of information in the context of public values.

## Conclusion

Decision making used to be a topic of interest in the study of public administration. At the moment there are few PA scholars who write about public sector decision making (Morçöl (2006); Raadschelders and Whetsell (2018); Moynihan and Lavertu (2011)). The most important advances in DM-theory have been made in behavioral psychology and behavioral economics. It is important to point out that elected officeholders, career civil servants, and scholars nowadays very much emphasize evidence-based decision making, which is a process where scientific knowledge and facts drive the decision to be made. While there is nothing wrong with gathering evidence, we cannot overlook the fact that decisions are just as much influenced by organizational knowledge (i.e., the strategies, rules, techniques, procedures, routines, and interests of an organization), by societal knowledge (i.e., what values are shared in society, are advanced by the political party (in the USA, UK) or the coalition (in continental European countries) in power), and by individual knowledge (i.e., preferences of individual decision makers as influenced by religious and political affiliation, life experiences, upbringing, and ethical preferences). Much public sector decision making concerns tame and simple problems, and decisions made about these are generally not what drives research into decision making. Public sector decision making that concerns wicked and complex problems, though, requires awareness of the

various knowledge sources that decision makers consciously and intuitively tap into.

## Synonyms

Administrative arrangements; Central government; Discretionary; Federal government; Governance arrangements; Mandatory; Required; Voluntary

## Definition

| | |
|---|---|
| Accountability | Responsibility for showing the performance or cost of a service |
| Public management networks | Networks of organizations that work together and are responsible for providing a public good or service. |
| Network administrative organization (NAO) | The coordinating body of a public management network. |

## Introduction

The advent of government collaboration and the disarticulated state has altered traditional conceptions of public service delivery and accountability, which in this paper we define as accountability for public service cost and performance. These collaborations of public organizations are discussed here as public management networks or just networks. Public management networks have been the focus of much attention in public administration for over a decade, as scholars have borrowed and extended network ideas from sociology to develop key network concepts. The shift from hierarchically managed organizations to horizontally self-organizing collaborations logically has implications for organizational decision-making in these new types of public management networks.

Since O'Toole's seminal (1997) study, public management networks have been studied extensively. Some, such as Provan and Kenis (2008), study the differing structure of networks, and others have looked at the effectiveness of networked organizations (Provan and Milward 1995). Some studies have noted the importance of trust and reciprocity (Provan and Kenis 2008; Thurmaier and Wood 2002), and others have noted the contractual (Cohen and Eimicke 2008), hierarchical (Rethemeyer and Hatmaker 2008), and jurisdictional (Agranoff and McGuire 2004) dimensions of networked service delivery. Most recent studies tend to find that the structure of the network leads to differences in decisions and outcomes.

In this entry on decision-making in networks, we first define networks and the types of evaluative decisions of which we are going to discuss. Then we discuss decisions related to cost and performance, which are critical to further discussions about the network. In the conclusion we discuss how network cost and performance decisions feed into other decisions about the network such as decisions to expand the network to other partners or expand the network to other types of services. Ultimately, the cost-effectiveness and performance of the network may determine whether the network grows and thrives or is scaled back or terminated.

## Defining Networks and Network Typologies

Since much of the literature has distinguished between types of networks and their features, it is important to make some of these key distinctions here. These distinctions influence both the type of network and the decisions that are made in the network.

In the literature, we see that there are many types of networks. Importantly, we must first distinguish between whether it is a hierarchical network or a horizontal network. The first type is the hierarchical network and pertains in cases such as when a central, or federal, government works with a network of local governments to provide a service. Examples of this type of structure include examples such as the network of mental health provision in the United States that are primarily provided by local mental health clinics that are managed at the county and state level and that receive funds from the federal government. Others have noted that there are services, usually at the local level, where autonomous organizations that have the same level of authority in adjoining jurisdictions work together to provide services. Examples of these types of services are things like road networks and collaborative solid waste pickup.

Closely related to hierarchical and horizontal organizational network structure is the issue of whether the collaboration is mandatory, required,

or discretionary, voluntary. Both hierarchical and horizontal collaborations can be either mandated or discretionary. For example, the federal government may require law enforcement agencies to work with its federal law enforcement for many types of issues, or it can provide grants to incentivize issues like information and communication technology interoperability. In the latter case, the networking of the communication technology is incentivized but discretionary. Likewise, at the local level, the federal government can strongly incentivize collaboration through its use of federal funds to establish regional planning and road networks. In contrast, local governments may collaborate completely independently for things like solid waste pickup, and the decision to participate in these networks is completely voluntary. It is likely that collaboration and networked service provision exist on a continuum of networks from completely required to completely voluntary. In this entry, we examine network decision-making in networks that are horizontal and voluntary because these networks should have the most discretion in their decision-making about the network.

Additionally, we make the distinction between extant and emerging networks and distinguish between networks that have a central agency and those that are completely disaggregated in their decision-making. First, it should be noted that networks and networked service delivery are new and fashionable service delivery options. So, many networks are new or emerging and may not have had time to fully develop into a functioning service provider. In other words, they may exist simply "on paper" and may provide very little or no service. Conversely, extant public management networks are already in existence and providing a service to their network members. Because local and regional cooperation has been important as a planning concept at least since the 1960s and 1970s, some networked organizations that we have studied are over 50 years old. The decision-making about an organization that is decades old is very different than that of a newly conceived network. Secondly, the organizations that have been around for some time are likely to have governance and administrative arrangements that allow for greater coordination and structure than newer networks that may be more disaggregated in decision-making and lacking in network structure. This network coordinating body is known in the literature as the network administrative organization or NAO. This organization often provides or coordinates the service for the member organizations.

In this entry, we further distinguish decision-making in extant public management networks, and these public management networks further often have NAOs. The characteristics of the public management networks of interest are thus that they have (1) three or more members, (2) a shared or overlapping purpose for network membership, (3) joint oversight, and (4) coordinated interaction between members and not just interlocking contractual relationships. In other words, the organizations are aware that they belong to the network and can make decisions about the network as a whole and not just individually reacting to other organizations with which they have relationships.

Within these horizontal and extant networks, scholars have noted that there are distinct subtypes of networks (Agranoff 2007; Mitchell and Thurmaier 2016). The first subtype of network is the informational network that allows network members to share information about "policies, technologies, and solutions" (Mitchell and Thurmaier 2016, pp. 50–51). The second type of network is known as the developmental network that provides education and training for member organizations. The third type of network is the outreach network that does things such as "…shares information, coordinates programming, jointly pursues resource opportunities…." The final type of network is the action network where the members work together to actually provide services across their jurisdictions. The literature shows that different types of networks are likely to have different network structures and different network decision-making processes. In the next section, we discuss how we have found evidence that decision-making varies significantly in these different subtypes of networks.

## Decision-Making in Networks

Since we have already stated that we are going to focus in this entry on horizontal and extant networks, we need to briefly discuss the types of decisions that we focus. Because the public management network is extant, the decision about whether to start the networked organization is already made, and many of the main governance arrangements, such as rules for organization and conduct of member organizations, have also been established. Therefore, the primary decision-making issues are primarily evaluative in nature; particularly we focus on decisions about performance and cost. In the discussion section that follows this one, we note how other decisions like the expansion of the network or changing organizational arrangement can be influenced by these important evaluative decisions about the network.

Generally, the importance of trust in networks cannot be overstated. The literature has broadly found that trust is one of the key elements of decision-making and structure of networks (Provan and Kenis 2008; Thurmaier and Wood 2002). Having trust in the relationship reduces transaction costs and increases the ability to coordinate the network. Research broadly finds that networks where trust is high are more effective in delivering services and better at responding to needs in the environment. As a structural feature of public management networks, most are run by a board of directors. Usually the board is made up of an equal number of representatives from the participating jurisdictions, and sometimes the NAO is given representation on the board. The board tends to make decisions that are highly consultative with their member organizations so as to maintain trust in the network.

Because network boards are usually highly representative of the membership and the decision-making process is consultative, we are told that network decision-making is not often confrontational. Particularly in developmental networks, outreach networks, and action networks, the organization often gets a level of training, outreach, and service that it simply could not achieve on its own simply through economies of scale. These characteristics of networked services make them easily justified to the governing bodies of member organizations, and network members often describe the network service as a "bargain" (Mitchell and Mohr 2019). However, in spite of the often easy evaluative decisions about network performance and cost, there are important ways that decision-making about performance and cost vary by types and subtypes of networks.

Mitchell and Mohr (2019) find support for an ecological model of accountability in networks. They find important differences in how organizational members evaluate cost and performance in networked organizations. They find that the trust of focusing on a common purpose reduces additional cost monitoring in the network much like the literature would suggest. The policy salience or importance of the service was associated with an increase in cost monitoring in the network. Likewise, conflict as a proxy for a lack of institutional balance in the network increased cost monitoring. Finally, perceptions of network cost effectiveness were associated with reduced monitoring of additional costs in the networks.

When it came to performance, the decisions about network performance were primarily of the programmatic output type: X number of things produced or Y number of people trained. Interestingly, one of the most important programmatic outcomes noted in the Mitchell and Mohr study was the cost-effectiveness of the networked service delivery. When the networked organization could produce the needed good or service at a savings for the organization, it was often easy to justify the performance.

Finally, within different subtypes of organizations it was found that decisions to monitor cost varied significantly. For example, no organization that participated in information and outreach networks did additional cost monitoring beyond reviewing the payment that they made to the NAO. In other words, they could easily see what their network participation provided, and there was no need to monitor costs further. In action networks, a little over 14% of the organizations monitored costs to their organization outside of the budgeted payments but organizations that participated in developmental networks had

significantly more than the other three types of networks (26.7%). In the words of the participants, the action network participants do not often have issues of trust, but occasionally there may be an issue like an employee of the network stealing that may create conditions for additional cost monitoring. However, in the developmental networks, there are significant and ongoing costs that must be monitored such as the amount of time that employees spend in training and related costs. Interestingly, these costs are often associated with reasons that justify the use of the networks. For example, if the network can provide training for an employee locally that would otherwise require travel across the state or out of state to get the required training, then the cost savings can justify the network membership.

In summary, in decisions about network cost and performance, the research shows that trust is key. The recent Mitchell and Mohr study found a quantitative link that has primarily been shown through qualitative studies previously. The research also showed that common purpose, institutional balance, and perceptions about cost-effectiveness influenced cost and performance monitoring. From this study, it appears that one of the key dimensions of public management network performance is often the cost-effectiveness of the network service.

## Discussion and Conclusions About Decision-Making in Networks

This entry has discussed evaluative decisions in extant, horizontal networks. While this discussion of evaluative decisions about cost and performance may at first appear limited, it is important to note that evaluation decisions about cost and performance influence other important decisions about the network. For example, the decision to add new members will likely be influenced by the perception of whether the new members will further increase the economies of scale that can be achieved by the network. If the network is already cost efficient, further reducing the cost of the service can only be seen as beneficial. If it is decided that the cost of the network is a concern, the network may seek out new members to lower the per member cost. Finally, if the cost and performance of the network are not sufficient, then the networked organization may be terminated. While these conclusions are logically derived from the literature, there have been few studies that have looked at these issues in the public sector, and we believe that more studies should look into these issues. Likewise, issues of cost and performance are likely to either promote or hinder the further expansion and development of public management networks. In sum, the evaluative decisions around cost and performance are likely to be highly important in any network that is not mandated by a higher-level authority.

# Decision-Making in Nonprofit Organizations

Charity R. Remington
The Mission Haiti, Lake Placid, FL, USA

## Synonyms

Decision-making; Organizational strategy

## Definition

The process of making a choice from various alternatives to achieve a desired outcome.

## Introduction

In general, the decision-making process consists of identifying the problem or opportunity, developing alternatives, evaluating alternatives, and choosing and implementing the best alternative and then evaluating the decision. In a nonprofit organization, decision-making is impacted by both the internal and external environment. Everything from the size of the organization to the resources it has available and to the goals and strategic plan of the organization and their feasibility of implementation can play a vital role in an organization's decision-making process.

Organizational decision-making models are multiple and diverse and frequently serve as reflections of organizational design. Hierarchical organizations tend to have leadership-centric decision-making processes, while flattened organizations often push decision-making out to the wider group. Decision-making processes can fall across a broad spectrum, from centralized and tightly controlled to fully democratic and highly inclusive. Most organizations fall somewhere in the middle of this spectrum by allowing open participation in some decisions and making other decisions exclusive to a select group.

### Background in the Nonprofit Context

In the nonprofit sector, there is a wide range of decision-making strategies that vary both in terms of scope and structure. While decision-making strategies are similar to those employed in the private sector, there are multiple factors that make decision-making unique within the nonprofit context. Organizational characteristics of nonprofits limit both the types of decisions that can be made and the range of feasible solutions available for solving problems. Unlike for-profit entities, which are created to fulfill the primary mission of producing economic gains for owners or stakeholders, nonprofits organizations are created to fulfill a public good. The not-for-profit organizational structure both confers privileges and imposes restrictions. Nonprofit organizations can solicit public donations and are exempt from federal taxation, but they also face greater public scrutiny and strict regulation. These rights and restrictions create an initial filter for nonprofit decision-making, constraining organizational options to those which are legally and ethically available.

In a similar manner, a nonprofit organization's mission and values are primary drivers of decision-making (Butler 2016). A clearly defined mission automatically precludes certain decisions and actions. Choices that fall outside of the mission's scope are excluded. Instead, decisions must be made that further the organizational mission and goals. This missional filter exists for more than just organizational efficacy. Because nonprofit organizations solicit donations for the accomplishment of their mission, decisions must be made that are in keeping with that mission and that are consistent with the message communicated to donors. Integrity and transparency in the use of donations (and therefore within the decision-making process) ensure both accountability to donors and beneficiaries alike.

There are other constraints on nonprofit decision-making, as well. For example, many smaller nonprofit organizations may have limited technical or organizational capacities and small resource bases. These organizations may have weak linkages with other resources and community actors in development. Limited strategic perspectives, constrained by a nonprofit's vision, mission, or organizational history, may also place explicit or implicit boundaries around decision-making strategy.

Additionally, a nonprofit's budgetary constraints or organizational structure may utilize volunteers instead of paid staff. This may limit the feasibility of certain activities or create the need for additional oversight or increased costs that simply are not deemed worth the trade-off. Moreover, there are many constraints on the types of solutions which can be utilized when solving problems in the nonprofit sector. For example, the relationship between the government and nonprofits may involve legal, ideological, administrative, and political constraints. Also, competition may exist between donor, management, and board priorities, mitigating the rate of organizational change.

Furthermore, in nonprofit organizations, funding is often limited, unpredictable, or earmarked for specific purposes. This uncertainty may automatically eliminate many possible solutions to problems, restrict innovation, and create further issues needing to be addressed through the decision-making process.

In the private sector, executives have some degree of autonomy and flexibility with respect to decision-making responsibility. In the nonprofit sector, decision-makers are faced with multiple layers of accountability. Nonprofits are accountable to stakeholders, donors, and beneficiaries as well as local and national laws and regulations of the countries in which they operate.

Nonprofit performance is not only measured by the amount of good the organization accomplishes. It can also be assessed in terms of the agency's management and decision-making processes, its demonstrable accountability and transparency, and how well the organization is governed. Decision-making processes must help management of the organization's resources in ways that are accountable, equitable, transparent, and responsive to the needs of beneficiaries (Kendall and Martin 2000).

As in the private sector, nonprofit organizations are invariably faced with a multitude of serious and complex decisions that involve multiple stakeholders. But in the nonprofit sector, such decisions have the potential to impact the lives of beneficiaries, for good or ill. In such a high-stakes environment, nonprofit organizations must often make difficult decisions about the most efficient ways to achieve their mandate and about the quality, quantity, impact, and value of financial decisions while maintaining responsiveness to beneficiaries. Nonprofits can also be held accountable for the reliability and independence of their organizational structures, such as the composition and role of the board, management and financial structures, and human resource management practices and policies.

## Decision-Making Processes

Before the decision-making process can begin, the organization must first establish who will make the decision, who will implement it, and who has the authority to approve the decision or even veto it. In a nonprofit organization, decision-making ambiguity can often occur between the board and staff, headquarters and regional branches, and at different levels of management. Without clarity on the decision-making process, confusion can ensue and organizational performance can begin to suffer.

To formalize the decision-making process, many organizations utilize specific decision-making frameworks and instruments. There are several tools available to help clarify the decision-making roles. While the majority of these tools originated in the private sector, they are frequently used in the nonprofit sector to help formalize decision-making processes. These tools and processes often have four or five steps in common that include some form of the following: identification of the problem or opportunity, developing alternatives, evaluating alternatives, choosing and implementing the best option, and assessing the decision. While there are numerous

variations upon this theme, these steps are a recognizable thread running through the most commonly held decision-making paradigms.

Some of these tools are:

RAPID (Recommender, Approve, Perform, Input, Decide)
LACTI (Lead, Accountable, Consult, Tasked, Informed)
CAIRO (Consulted, Approves, Informed, Responsible, Out of Loop)
IMRN (Input, Make, Ratify, Notify)
ASICK (Accountable, Support, Inform, Consult, Okay)
RACI (Responsible, Accountable, Consulted, Informed)

### Identification of the Problem or Opportunity

Any decision-making process must first begin with a clear identification of the problem or opportunity (Verschaffel 2011). Whether an organization is big and multi-departmental or run by a small staff of volunteers, each agency has unique goals. Within the organization, individual departments or teams also have goals, while external stakeholders, such as donors and community leaders, may have goals and expectations of their own. The establishment of clear and realistic goals serves as the foundation for identifying problem areas, deciding on courses of action, and evaluating the decision's outcomes.

When organizational goals are not being met, it is vital that leaders understand both why and how this is occurring. Anything from mission creep to inadequate funding to misappropriation and beyond can lie at the root of organizational problems. By carefully examining every situation through the filter of clear organizational goals, nonprofit agencies can begin to recognize superfluous programming, imbalanced budgets, and threats to effective functioning. The process of problem identification often requires a scan of the external and internal environments for issues that merit attention. Managers examine the world around them to establish whether the organization is progressing satisfactorily toward its goals and which forces and drivers are influencing it.

On occasion, an objective assessment may turn a problem into an opportunity. The strengths, weaknesses, opportunities, and threats (SWOT) analysis, for example, is an appraisal tool which aids in identifying the problem, analyzing the agency's larger ecosystem, assessing its internal strengths and weaknesses, and examining the organization's capacity to respond to the problem. A SWOT analysis takes into consideration the organization's internal strengths and weaknesses, along with external opportunities and threats in its surrounding environment. These factors are organized on a chart according to categories, and then they are analyzed and deconstructed in order to provide a fuller picture of the organizational system in which the agency exists.

### Developing Alternatives

After identifying a problem, it is time to begin generating alternative solutions. In developing these alternatives, nonprofit managers must first consider the organization's strategic vision and specify the goals that they expect to achieve through their decision (Zopounidis 2011). Strategic planning is a management process that combines a clear statement of the organization's mission, the identification of the organization's stakeholders, the outlining of its strategic objectives and goals, and the development of strategies to achieve them. If the organization already has a clear strategic plan, this step should be simple. If not, strategic planning quickly becomes an essential component of the decision-making process to develop alternatives which will satisfy the strategic vision of the organization.

Strategic planning is the backbone of strategic management, and it is a fundamental process in the conduct of strategic management in nonprofits (Kaplan 2001). The significance of strategic planning can be explained from four points of view including environmental scanning, strategy formulation, linking goals to budgets, and to the strategic planning as a process. For strategic planning to be useful and productive, there must be involvement and commitment across all levels of the organization to overcome problems such as rivalry among projects and departments, resistance to change, resource allocation issues,

resource requirements, and so on. Over time, the practice and concept of strategic planning have been embraced globally and across public and private sectors because of its contribution to fast-track performance and organizational effectiveness.

There are many factors that influence decision-making through the strategic planning process. Environmental uncertainties can hinder the development of long-term plans, while legislative changes can introduce new dynamics into a sector. Additionally, the complexity and size of an organization creates variables and uncertainties that need to be reevaluated on a regular basis. There are many reasons that organizations may need to revise their strategic vision, such as the need to better orient the organization to the needs of the community, to plan for growth and expansion, to accommodate changes in the regulatory environment, or to adjust to new economic realities (Lewis and Wallace 2000).

Effective strategic planning initiatives make organizations more viable and responsive by turning comprehensive goals into action steps and facilitating the creation of timetables for how long tasks should take to avoid sidetracking of efforts and helping to correct deviation from commonly held objectives.

Strategic planning is a continuous process that requires constant feedback on how the current strategies are working and makes adjustments to those strategies whenever necessary. Because of this, all alternatives for decision-making must be feasible and in keeping with the organization's strategic plan. The plan itself should act as a filter, weeding out aberrant alternatives and generating alternatives that advance the vision, mission, and values of the agency.

## Evaluating Alternatives

The next step of the decision-making process is the evaluation of possible alternatives. There are advantages and disadvantages to every possible solution, and nonprofit organizations must think holistically and strategically, weighing carefully the potential consequences and benefits of each option. In some situations, there may be more than one solution to a problem, and in other situations, there may be no viable solution and a whole new paradigm is required. It is essential that managers accurately appraise arguments for or against a particular alternative in order to have a clear and usable understanding of the choices they are facing. Alternatives must be evaluated not only for their possible results but also for their feasibility and their alignment with the organization's vision and mission.

One of the major factors determining the feasibility of a given alternative is the nature and dependability of the organization's funding. In many nonprofits, resources and institutional capacity are limited. Financial resources may be the determining factor in the organization's course of action and the timeline for implementation. Evaluating available resources and identifying resource constraints require decision-makers to think about new ideas, knowledge, procedures, methods, and strategies for the completion of work.

During the evaluation stage, reliable, current, and pertinent information must be collected and potential outcomes considered. Changes in external conditions, such as societal, political, economic, or demographic shifts, new regulatory processes, and even competition for funding may impact the viability of an alternative. Predicted shifts in key external conditions may reduce the impact of an alternative or even eliminate it altogether.

There are many decision-making tools which are useful when evaluating alternatives. One commonly used method is the scenario technique, a strategic foresight method used in decision-making teams to envision multiple possible futures and to decide upon the organization's preferred future and cocreate a strategy to help the organization create that preferred future for their agency. Another method for weighing alternatives is known as the "decision matrix," a tool that uses a chart and a point system to assign value to different components of each alternative. After completion, the points are totaled and the option that receives the highest total score is selected. Perhaps even more commonly used is the cost-benefit analysis. Traditionally associated with for-profit corporations, a cost-benefit analysis in a nonprofit organization measures the cost of

making a given decision against the potential benefits that decision may have. A cost-benefit analysis of each alternative can provide decision-making teams with a more accurate picture of possible ramifications and the costs attendant with each one.

### Choosing and Implementing the Best Alternative

A decision is made after generating and evaluating several alternative courses of action and carefully weighing each option for organizational fit. A decision is considered to be effective if it addresses the problem, achieves a predetermined set of goals, and is feasible using the resources available to the organization. Even more importantly, it must conform to the organization's vision, mission, and values and be ethically and legally sound. Alternatives that are feasible but fall outside of these parameters are eliminated from consideration. Unless criteria of success are established ahead of time, it is impossible for an organization to gauge the success of a decision after implementation (Forbes 1998).

After the selection of an alternative, managers must ensure that the chosen alternative is thoroughly carried out. The implementation of an alternative begins once the decision of choice is established. Effective implementation of a decision is as important as the decision itself, and many carefully made decisions are not realized due to a failure in the implementation phase.

In the nonprofit sector, effective implementation is the result of careful selection. The selected alternative must be viable and stay within budgetary constraints and be implemented by staff or volunteers. This requires careful planning and the creation of structures that allow for delegation, address issues of conflict management, measure execution, quantify the return on investment, and consider team motivation (Kaplan and Norton 1992). Without strategic implementation, the selected alternative has little hope of ever being actualized.

### Evaluating the Decision

The decision-making process does not end with implementation. The final step is to evaluate the decision based on specific outcomes, enhanced operations, social change, or other predetermined metrics of success. The decision's success or failure is based on how well it meet or did not meet these predetermined goals. Decision goals may be aimed at improving outcomes or operations. Outcomes refer to a nonprofit's social impact with respect to its mission. Assessing decisions involves identifying indicators of impact in order to measure outcomes. Evaluation of decision success may focus on measuring improvements with respect to internal processes, expansion of reach or influence, or shifts in organizational culture. Regardless of what is measured, the technique for tracking success must be specific and predetermined.

One technique for measuring success is the establishment of critical success factors (CSFs) before the decision-making process ever begins. CSFs are predetermined checkpoints that must be met if the decision-making process is to be considered effective. An organization can check the reality of what transpired against their list of CSFs to determine whether an initiative was successful. In a similar vein, key performance indicators (KPIs) serve as predetermined signals that an organization can watch for to gauge progress and assess decision-making efficacy. For example, donor retention rates, rates of growth, and changes in volunteer participation rates can each be KPIs that provide the organization with a better understanding of both implementation success and failure.

Another option for evaluating the impact of a decision is the use of a strong evaluative instrument, such as the Organizational Culture Assessment Instrument (OCAI). The OCAI assesses and plots an organization's culture before a decision-making process takes place and then reassesses and plots the organization's culture afterward, helping organizational members assess the success of their decision-making processes and the implementation of their goals.

No matter the metrics for measuring success, after a decision is implemented, the performance of the decision must be compared to the predetermined goals it was set to achieve. The evaluator must identify the deviation, if any, between the planned and actual performances, learning what worked, what did not work, and the reasons

behind both successes and failures (Herman and David 1999).

After evaluating the success of the decision, organizations then may find proactive ways to adjust the implementation of the decision or, if that is not possible, improve the decision-making process for greater success in a future scenario. This may include seeking direct feedback from employees through surveys, focus groups, or roundtables. It may also include outside evaluations, assessments by beneficiaries, or a formal appraisal of expectations versus reality. Outside consultants can often help the organization better understand why implementation of a given initiative was successful or unsuccessful and can probe for answers, discover blind spots, and result in insights that those within the organization may be unable to see. A thorough understanding of the impact of decisions is crucial to refining the decision-making process if an organization is to remain effective over the course of time.

## Conclusion

Decision-making in nonprofit organizations begins, first and foremost, with the establishment of the nonprofits' mission, values, and goals as central to and the basis for the decision-making process (Hicks 2005). The decision-making process involves several steps and selecting from various alternatives in order to achieve a desired outcome. Outcomes represent measureable changes that are indicative of the impact – or social change – a nonprofit seeks to make with respect to its mission. Achieving desired outcomes requires a strategy for the selection process that meets the needs of the organization and its stakeholders. Effective nonprofit organizations do more than make ad hoc decisions; they also learn how to systematize the successful decision-making process and use it again for future decisions. By identifying the problem or opportunity, developing and then evaluating alternatives, choosing and implementing the best alternative, and evaluating the decision, nonprofit organizations can make quality decisions which turn problems into opportunities and satisfy the mandate of their stakeholders while continuing to meet the primary needs of their beneficiaries.

# Decline of Coal as an Energy Resource

Debbie Firestone[1] and Warigia M. Bowman[2]
[1]Environmental Energy & Natural Resources Advocates, Tulsa, OK, USA
[2]University of Tulsa College of Law, Tulsa, OK, USA

## Introduction

The USA and most of the Western world are turning away from coal production and generation, so it may be surprising to some that coal remains the largest source of electricity generation internationally. Coal continues to be used as an

energy source in part because it is plentiful, and in part because it is relatively inexpensive.

Coal creates significant negative externalities, both during the mining process, and after mining wastes are released into the environment. Societies face a choice: live with those negative externalities or address them through government action. Whether it is through regulation, control, or taxes, we look to our decision makers to address the overarching issues that accompany coal-powered energy generation, especially with regard to climate change.

## The Height of Coal

Coal is plentiful, and people have used coal as a source of energy for millennia. The Romans and ancient Chinese civilizations used coal (*Coal, Unearthing Ancient Mysteries* 2000). As an energy source, coal became prominent during the Industrial Revolution from the late eighteenth to the late the nineteenth centuries (Trueman 2015) when it was discovered that coal burned cleaner and hotter than wood charcoal (*Fossil Energy Study Guide* 2020). The steam engine harnessed coal energy, but machines used in manufacturing were the real catalyst for increased coal usage (Trueman 2015).

Coal is available in almost every country (*Fossil Energy Study Guide* 2020). As more countries have industrialized, coal consumption has risen. Coal generation has expanded in Southeast Asia and China (Malischek 2020). Over the past 20 years, 90% of all of the coal-fired capacity built worldwide has been in Asia alone (*World Energy Outlook* 2019). China relies heavily on coal, using it to generate more than 70%, and is the largest consumer of coal in the world (Inskeep and Westerman 2019). Today, India and China are two of the largest producers and importers of coal (*Coal Information* 2020).

## Upsides/Downsides

### Advantages

Coal use has its advantages. It is relatively inexpensive (Barber 2015). Since coal is found on every continent (*Where is Coal Found?* 2020), and since the infrastructure is currently in place to utilize it thanks to the Industrial Revolution, coal is seen as a tool to eliminate worldwide poverty (Mooney 2019). In addition, coal is abundant in the USA, particularly in the Appalachian region (Cherry 2015). The Cumberland Plateau's coal seams have had an incalculable impact on the politics, history, and economy of states like Tennessee, Kentucky, and West Virginia (*Id.*). The USA has a demonstrated reserve base with in-place coal that can be mined commercially at both underground and surface mines that would last over 300 years at current rates (*Coal Explained* 2019).

A stable, reliable energy source (Coal = Reliable Energy 2015), at its height, coal provided close to 90,000 mining jobs in the USA alone (*Thousands* 2020). Unlike renewable sources of energy such as wind or solar power, coal does not depend on weather conditions or other external forces (Coal = Reliable Energy 2015). Rather, coal provides continuous baseload power (*Id.*). In fact, the US Department of Energy, during the presidency of Donald Trump, created a strategic electrical generation reserve using coal for the purpose of national security (Schneider and Trotta 2018). The DOE cited grid resilience and grid reliability as their ultimate goals in establishing generation diversity and keeping coal a part of the national energy mix, although strong ties between the Trump Administration and the coal industry were likely a driving factor of that decision (*Id.*).

The so-called "clean coal" technologies capture $CO_2$ and address climate change to reduce emissions from coal (Clean Coal Technologies 2008). Tackling carbon-based emissions means not only creating new, clean infrastructure, but addressing existing systems and power plants. Current coal power plants can be made more flexible and efficient as to address carbon-based emissions and long-term sustainability goals (Malischek 2020). The International Energy Agency has considered three different options for reducing carbon emissions from existing coal-fired power plants: (a) retrofitting the plants with biomass co-firing equipment or carbon capture, utilization, and storage (CCUS);

(b) repurposing the plants to provide flexibility and adequacy while simultaneously reducing operations; or (c) retiring the plants early (*World Energy Outlook* 2019).

### Disadvantages of Coal as a Source

Unfortunately, coal has a severe environmental downside: it is one of the highest $CO_2$ emitters per unit of energy (Levin 2013). In 2019, coal accounted for 60% and natural gas for 38% of electric power sector $CO_2$ emissions in the USA (*Energy and the Environment* 2020). $CO_2$ emissions contribute substantially to the greenhouse gases that are affecting the world's climate (*Id.*). Additionally, there are health risks with inhalation of coal dust, with mining, and with the harmful chemicals used with coal, including pneumoconiosis and other respiratory diseases (*Coal Mine Dust* 2011). Inhalation of coal dust can cause premature death (*Id.*).

The transportation of coal to processing plants also presents significant dangers (Gleick 1981). Problems arise not only on railroad transport, but also on waterways (McBride 2005). Coal transport has increased to satisfy Clean Air Act obligations on mines in the East, leading to longer hauls from the West to Midwest and Eastern destinations (*Id.*). Accidents have triggered transporters to invoke indemnity, insurance, and force majeure clauses in contracts (*Id.*). Further, accidents are not the only issue, since coal dust contaminates the communities which are traversed causing incidental environmental impacts (Chadwick et al. 1987).

Coal mining has a negative effect on the human environment as well as on surrounding ecosystems and natural habitats. In a barren landscape of coal surface mining, it is easy to see the steep environmental price paid by the altered landscape (Coal 2020). Land erosion, drinking water deterioration, and wildlife habitat degradation result from mining, and the wastes produced from mining (*Id.*). Coal produces radiation via trace amounts of uranium contained in coal (Serle 2020). At the end of its fuel cycle, the radioactive waste generated from the spent fuel, fly ash, emits as much as 100 times more radiation than a typical nuclear facility (Cox 2011). Coal processing emits arsenic, cadmium, mercury, uranium, and thorium (Langsdorf 2017). Some studies show that communities surrounding coal power plants show the same, if not more, radiation than those areas containing a nuclear power facility (Cox 2011).

Coal use began when there was little understanding of modern, more efficient, cleaner sources of energy (Nijhuis 2014). Recently there has been a push toward the development of clean coal technologies in order to reduce global warming by the reduction of $CO_2$ emissions (*Clean Coal Technologies* 2020). Yet such efforts are costly. The coal industry struggles to remain competitive as it faces high costs to reduce coal emissions (*Id.*). Cleaning coal is costly because capturing carbon dioxide from hot flue gas streams following combustion is difficult considering $CO_2$ concentrations make up 14% or less of the total, with nitrogen making up the balance (*Id.*).

Aside from the difficulties caused by mining, coal use itself imposes heavy costs on society (Nijhuis 2014). The burning of coal produces coal ash that contains lead, ammonia, arsenic, mercury, and other toxic substances, which contributes to increased pollution (*Id.*). Coal ash is dumped in unlined ponds, which leads to toxins leaking into and contaminating groundwater beyond levels deemed safe for drinking water by the Environmental Protection Agency (*Mapping the Coal Ash* 2020).

In April 2015, the EPA promulgated a rule for the management of coal ash (*Util. Solid Waste* 2018). In a 2018 decision by the D.C. Circuit of Appeals, the court overturned some provisions of EPA's 2015 rule and remanded certain provisions back to the agency (*Id.*). Particularly, the EPA exempted from regulation unlined impoundments at inactive facilities, a provision the court determined was arbitrary and capricious (*Id.*). Since the remand, the EPA has been hard at work making changes to coal ash regulations to provide for the retrofitting or replacement of unlined impoundments to prevent leakage (*EPA Finalizes Revisions* 2020).

Yet, in August of 2020, the Administration of former president Donald Trump successfully managed to weaken the 2015 regulation

(Dennis and Eilperin 2020). The new "flexible, phased-in" approach allows coal power plants, the largest industrial source of toxic wastewater, to continue to leak toxic metals such as arsenic and mercury into lakes, rivers, streams, and groundwater (*Id.*). The new deadline is currently moved from 2023 to 2025, while entirely exempting dozens of coal-powered plants – those which are set to retire between now and 2028 (*Id.*). While the US Energy Information Administration reports that 121 US coal-fired power plants have been repurposed to burn other types of fuels between 2011 and 2019, with most of them converted to or replaced by natural gas-fired plants (*More than 100 coal-fired plants* 2020), the danger of coal ash from existing plants (both active and retired) cannot be overstated (*Coal Ash: Hazardous* 2018) Worldwide Coal Assessment.

Europe has experienced a strong decline in coal generation, with many countries focusing on aggressive policies phasing out coal use (Malischek 2020). This is partly due to the European Union's establishment of a cap and trade scheme, EU's Emissions Trading System (*EU Emissions Trading* 2020). Success has been shown in recent years as the EU transitions from phase 3 of the plan into phase 4 (*Id.*). Phase 4 runs from 2021 to 2030 toward reducing $CO_2$ emissions from coal and other fossil fuels to attain the emission reduction targets of the Paris Agreement (*Id.*; Paris Agreement 2015).

While in 2018 global demand for coal grew by 1.4% due to increased consumption in Asia (Hutzler 2020), the year 2019 saw coal-fired power plants' growth reach a decade low (Malischek 2020). Coal generation in China and Asia have helped to maintain coal's position as the predominant source of power generation worldwide (*Id.*).

Slowly, however, coal is being replaced by natural gas, wind, solar, nuclear, and hydropower, all of which have been significantly less affected by the economic disruptions caused by COVID-19 (*Id.*). If current trends continue for the foreseeable future, coal may continue to see more of a decline globally as renewable energy becomes more reliable.

## What Is Next on the Coal Horizon

### Changes in Coal Firing Strategies

Traditional plants burn pulverized coal. Power engineers are working to develop new coal firing strategies to help make coal a cleaner source. If coal is gasified before burning, it could help with the removal of $CO_2$ and also help make electricity generation more efficient (Nijhuis 2014). A new power plant in Kemper County, Mississippi was designed with gasified coal carbon capture in the design of the plant (*Id.*). Another idea is to burn coal in pure oxygen instead of regular air, which might make $CO_2$ from the flue gas a simpler process (*Id.*). Ultimately, however, coal generating electricity plants are switching to natural gas burning more than ever (Gossard 2015).

### Cap and Trade Control

One government response in environmental and economic policy vis-à-vis coal is to limit emissions from coal by means of a cap and trade system (Stavins 2008). The cap and trade arrangement involves a cap or upper-limit placed on greenhouse gas emissions from coal coupled with a market for trading the allowances (Farber 2012). As the total of the cap is split into allowances, each allowance permits a company to emit one ton of emissions (*Id.*). Companies may buy and sell the allowances at a supply-and-demand-driven price, giving companies a strong incentive to cut emissions in cost-effective ways (*Id.*). Cap and trade has already been utilized to regulate and limit the emission of sulfur dioxide, the primary precursor of acid rain (Driesen et al. 2016). Yet, businesses may find the uncertainty associated with cap and trade troubling (Lépissier and Barber 2014).

### Coal Carbon Tax

Technology has the chance to advance when governments require it, either by imposing a regulation on emissions or by the institution of a carbon tax (Nijhuis 2014). Carbon taxes are not a new concept. Congress has recently debated various different carbon tax proposals on fuels like coal that emit greenhouse gases (De Bolle 2019). An environmental tax on emissions is called a

Pigovian tax (Chelliah et al. 2005). The term is coined honoring British Economist Arthur Cecil Pigou who wrote about the idea in 1920 in his book, *The Economics of Welfare* (Hovenkamp 2009). Pigou described a tax as a way of equalizing the "marginal social damage of pollution" (Chelliah et al. 2005). The difficulty is that it is difficult to measure, but it centers on the concept of "the polluter pays" (*Id.*). A carbon tax is a market-driven device, which may be more efficient at reducing emissions than industry-level regulations like those used in the past (Lépissier and Barber 2014). A carbon tax could be the most cost-effective and business friendly way to reduce emissions from coal, and businesses appreciate its predictability (*Id.*). Taxing carbon is not new – 11 countries are currently pricing carbon (Ye 2020). Nine proposals instituting a new carbon tax were considered in the 116th Congress (2019–2020) (Energy Innovation and Carbon Dividend Act of 2019, 116 H.R. 763; Healthy Climate and Family Security Act of 2019, 116 S. 940, 116 H.R. 1960; The American Opportunity Carbon Fee Act of 2019, 116 S. 1128; The Climate Action Rebate Act of 2019, 116 S. 284, 116 H.R. 4051; The Stemming Warming and Augmenting Pay Act of 2019, 116 H.R. 4058; The Raise Wages, Cut Carbon Act of 2019, 116 H.R. 3966; The America Wins Act of 2019, 116 H.R. 4142; The Modernizing America with Rebuilding to Kickstart the Economy of the Twenty-first Century with a Historic Infrastructure-Centered Expansion Act of 2019, 116 H.R. 4520; The Carbon Reduction and Tax Credit Act, 116 H.R.5457; and, The America's Clean Future Fund Act, 116 S. 4484.). Most of the proposals tax carbon upstream, i.e., at coal mines (Ye 2020).

Burning coal causes harmful effects to third parties. A carbon tax would level those out by causing companies who mine or burn coal to internalize the costs. The typical example of a negative externality is a motor vehicle with non-compliant emissions, which produces exhaust that everyone around it has to breathe – everyone but the driver who is not internalizing the cost (Negative Externalities 2020). If a penalty or tax were imposed on coal producers, which is equivalent to the amount of harm coal brings about, then an equilibrium would result (*Id.*). The difficulty lies in calculating that cost.

In theory, a carbon tax would cost coal producers an amount equivalent to the harm that coal produces (Wihbey 2016). Since consumers would bear the brunt of the tax being passed on to them, in most of the bills considered by Congress in 2019, a redistribution plan was baked in (The Climate Action Rebate Act 2019). In The Climate Action Rebate Act of 2019, consumers would receive a sizable portion, 70% of the revenues, as a monthly dividend to US citizens and lawful residents (*Id.*). The rest of the tax revenues would be used for research, design, and development (*Id.*).

A domestic carbon tax could be seen as an impediment on international competitiveness of US companies, since the world's largest polluters, countries like China and India, have no such mechanism in place (Energy Innovation and Carbon Dividend Act 2019). The solution proposed is a carbon border fee, similar to a carbon tariff, which would be levied on imported fuels and carbon-intensive goods (*Id.*). The fee would evaporate when the importing country has implemented a climate policy equivalent to the proposed US program (*Id.*). Such a tariff would have the effect of prompting countries in the world to act so that they will not be paying money to the US government coffers, incentivizing them to implement their own carbon tax initiatives (Ye 2020).

While revenues from a carbon tax used to provide dividends to American consumers, it would not be the end of the benefits. A carbon tax would provide incentives to corporate innovation and an impetus to encourage global attention to an impending worldwide problem, climate change.

### The Biden/Harris Administration

President Joseph R. Biden has indicated that he plans to phase coal out and eliminate subsidies (Chalfant 2020). By selecting Michael Regan to lead the Environmental Protection Agency, the Biden administration has signaled its eagerness to have an expert at the agency handling the Trump environmental rollbacks (Beitsch 2020). Regan's key accomplishment in his role as North

Carolina's top environmental post was his reaching a settlement with Duke Energy to spend billions on coal ash cleanup, making it the largest coal ash cleanup settlement in history (Weir 2020).

Fighting climate change has long been a major policy focus of President Biden. The President Obama website touted an energy plan that supported clean coal, but then Vice President Biden said in one speech he made in Ohio, "We're not supporting clean coal" (White 2009). Power producers nationwide are adjusting to this change in tone, and making plans to exit coal and embrace renewables (Howland 2020).

## Conclusion

Coal has been a source of heat, warmth, and energy for centuries. Since coal is abundant and inexpensive, and since it is located conveniently in numerous countries on every continent, it has enjoyed a prominent place in the energy generation mix of nations on every position on the first-, second-, and third-world spectrum. Yet, due to its significant health and environmental impacts, most notably its massive contribution to greenhouse gases, coal is, and should be, in decline.

Whether governments pursue a cap-and-trade scheme, a carbon tax policy, or some other system not yet developed, it is the duty of government to lessen the negative effects of coal. In the USA, the new Biden administration will certainly pursue legislative and administrative means to curb coal use. This approach can provide leadership to other countries, which burn large amounts of coal. The recent efforts of the USA to re-enter the Paris Climate Accord also provide a positive signal regarding sustainable energy use. Globally, efforts to address climate change must incorporate efforts to quickly reduce dependence on coal as an energy source.

# Decoupage Governance: Design-Outcome Gap

Carlos Zamora-Bugueño[1] and Maite Jiménez Peralta[2]

[1]University of Viña del Mar, Viña del Mar, Chile

[2]Pontificia Universidad Católica de Valparaíso, Valparaíso, Chile

## Synonyms

Homeostatic governance; Informal governance; Micro-adaptative governances; Pastiche governance

## Introduction

At the international level, Chile appears as a model in design, solidity, and effectiveness of results in public policies (Aninat et al. 2006); however, an internal and local analysis reveals a discrepancy between compliance with the design (supported by indicators) and actions declared by local executers. The connection between them throughout the entire structure of the policy (design, dissemination, implementation, and evaluation) becomes artificial (Jiménez 2019; Zamora 2015). To look at public policies in a process perspective is to understand that it operates at different levels, from the definition of the public problem to the moment in which the effects of it are verified (Olavarría-Gambi 2007). Thus, its analysis is oriented to answer how the implementation of the policy responds (or not) to the intention of its design (Pressman and Wildavsky 1998). This is part of the formal and institutionalized process, where different actors explain their interests. The implementation resorts to a strategy where executers, as independent actors to designers, must materialize the stated purpose. It is not unusual for them to end up developing a language consistent with "their" politics, controlling information circuits, or changing relationships and balances of power (Stone 1998).

Since the 1980s, two perspectives are opposed in the way of understanding the process: (i) up-down perspective presumes that the executer develops activities according to the objectives and indications given by the authority (Meny and Thoening 1992); (ii) bottom-up perspective focuses attention on the set of formal and informal relationships that occur between different actors that execute the policy (Howlett and Ramesh 2003). Thus, the results do not always respond to the design (design-outcome gap), independent of the quality of said design (Olavarría-Gambi 2007).

The states and their administrations tend to participate in governmental relational processes for the purpose of governing and decisions that according to public policy are supported by laws and regulations. They are insufficient in the face of the complexity and magnitude of problems

faced by the executers, since they must satisfy broad and inclusive societal criteria to achieve a status of new public governance (Quintero 2017).

## Chile, Latin-American, and Policy Networks

As product of a history different from that experienced in Europe, the Latin-American identity is ambivalent (Gissi 2004). A cultural need to adapt prefers sapiential knowledge to the scientist (Morandé 1984), affecting how policies are designed (Armijo 2000; Tello Navarro 2010).

There is a discourse where practices and values converge that articulate the properties of a space that establishes the limits of what is and what is not (Petersen 2009; Spink 2001). Therefore, the problems and reasons of the state are more problems of the government than problems of the population (Silva Arriola 2009). All this, in a context of management practices, is led by indicators that regulate the performativity of the speaker (Avis 2003, 2005).

Chilean politics, analyzed as a heterogeneous socio-technical network (Grau et al. 2010), is constituted by systematic and varied associations between different actants: human and nonhuman (institutions, regulations, registers, etc.), articulating as a network thanks to these relationships and permanent coordination.

An analysis of actors and scenarios, in the process of formulating policies, recognizes the scope and type of function developed by them. Their interactions are delimited by a group of underlying factors (formal and informal rules, interests, preferences, and capacity) and by the expected behavior of other actors and characteristics of the scenarios in which they are located.

Two Chilean public policies will be presented: national plan for mental health and higher education. Their implementation can be seen as the execution of a set of activities aimed at achieving goals established by state interventions; it is revealed as a scenario in which the actors are neither passive nor neutral (Olavarría-Gambi 2007), since the roles they play will deviate from what is expected in formal rules and legally defined functions (Martínez 2008). An inscription mechanism would allow them to adjust to the text of the policy (Correa-Moreira 2012). As a complex process, it implies putting into practice a variety of mechanisms and procedures that involve a wide and diverse range of actors (Ramesh 2008). The theories of public policy decisions, the choice of intervention instruments, and the resources allocated during the formulation process are tested in reality (Olavarria-Gambi 2017), in a double game of policy execution and resolution of own interests.

## Mental Health and High Education Public Policies

In health policy, and especially in primary care, the action of the state transfers its public function to third parties; the most notable effect is an administrative "transfer" of its centers to municipalities (Law 19,378) (Jiménez de la Jara 2004), assigning them the role of executer and financiers of the action at the first level (Morales 2014). It established a relationship where the budget is mediated by performance indicators and the execution of health actions is managed to obtain resources.

Professionals are subjectivated through normative documents that regulate and establish their actions in detail; the registration systems that must be completed to inform the actions they carry out; and the interactions, and scope of these, which must be established with other members of the health network. Public networks are the most relevant component to fulfill their obligations (Sabatier 1986; Spink 2009). Primary health policies are now managed toward continuity between performance and compliance with indicators (cost-effectiveness) (Zárate 2010), to the point that the reading made by the executers is reversed and it is in the achievement of the latter where the former makes sense.

Although the indicators (and consequently the policy) are achieved, the implementation becomes ambiguous. A distortion of the nature of the task is deployed to avoid conditions that could discredit the participation of actors in the implementation

of the policy. The positions generated convert them into negotiated, defended, contested, and reconstituted borders.

In higher education, post-reform of 1981, it went from a centralized, elitist, and homogenous system to a regionalized, massified, and heterogeneous system where the participation of the private sector transformed the rules of the game (Fried and Abuhadba 1991). The construction of the public problem was based on the promise of mass access to improve opportunities in the workplace and boost the development of the country; the translation was to understand education as a private good instead of a public good (Schmal and Cabrales 2018).

The instruments were an opening to the participation of private agents, diversification of the offer, and change in the forms of financing through competitive funds and a lower participation of the state with regulation through supply and demand. As a central regulatory mechanism, an accreditation process was established. The transition to democracy perfected these processes (Brunner 1997; Gregorutti et al. 2016).

A more managerial and neoliberal governance looks toward the state as a custodian of resources. The university was "modernized" toward financial autonomy and academic capitalism (Slaughter and Leslie 1999). Knowledge is transformed into a consumer good, and the academic becomes a worker who works in a university industry. The academic career is transformed, and the competition regulates the quality of the system and its members (Rodríguez-Ponce 2011). The emphasis on relevance (Naidorf et al. 2007) and efficiency introduce a functional rationality (Ibarra and Porter 2007), shaped by economic incentives.

## Decoupage Governance

The agency theory (Kettl and Fesler 2005) understands the implementation of public policies as a network of chains of contracts. The authorities have the power to establish incentives and to guide the conduct of the agents toward the achievement of goals and sanctions to correct the deviations that may occur.

The decoupage character of governance recalls the technique of sticking paper cuttings of different colors on an object, to produce different visual effects (Pryce 2017).

The executers of the policies, in a performative action, are superimposing discourses to adjust the instruments to their own interpretations of the public problem, as well as the decoupage technique, creating the effect that the policy is being fulfilled because the result measured by the indicators points it out. However, there is a gap between the design and the result, since the public problems are not "out there" but are elaborated from the policy analyst (Subirats 1989).

In addition to this, although the institutional actors represent the "public thing," this does not prevent the presence and intervention of others that represent general interests, and the legitimacy of the action of the public powers is based on the capacity to respond to these sectors (and their interests) over their ideological arguments. Consequently, the different actors execute an "inscription" of the problem as an unfinished exercise, because the institutional logics come into conflict with the logic of the state and the market, resulting in different degrees of ambiguity of objectives, responsibility, and hybridity, which plays a crucial role in the achievement of the policy (Thomann et al. 2016).

## Conclusions

In the sphere of public policies, the time change requires a rethinking of the ways to explain the processes of formulating, elaborating, deciding, and implementing policies (Fuster and Morells 2012). Each policy generates its own space which is not neutral, and effects are produced both on the behavior of the different actors and on the modes of action chosen at the time of the public intervention (Lowi 1972).

The bottom-up perspective (Sabatier 1986; Sabatier and Mazmanian 1980) highlights the role of the subject as executor of public policies, observing what is happening at the lower levels of the chain or the implementation system,

providing access to how the administrative actors adapt, redefine, or block the decisions taken by the government (Thomann et al. 2016). The result is a deployment in which the subject executes himself, thus becoming an actor, to participate and faithfully execute the policy as requested but at the same time allows him to position himself according to his interpretation and interests.

The similarity of behavior presented by these two public policies, which are not linked, makes it possible to discuss a Latin-American style of government, a style that in form and results would fulfill what was expected for a public policy but that makes invisible the imbalances and significant errors that it has, with very different effects on the participants and recipients of these.

A decoupage governance is happening in both policies, due to the following:

- They express the nature of their actions as if they played a role in the system.
- The subject is presented from the agency, to become an actor in the network of the policy. This allows you to interpret the actions that drive the objective expected by the indicator. For this, he/she understands (decodes) the descriptions of the procedures, or the strategies, oriented to meet the indicators.
- The actors take advantage of the possibility to reinterpret the content of the indicators and organize informal relationships in the established networks protecting their identity.
- The actors tell a story in relation to others and in the need to interact as actors with objects that make possible their agency, positions of power, approval, and movement in the labyrinth of devices built by the policies.

There is an overlap of strategies that resolve the different forms of interpretation of a public problem on which a specific policy is based. This is not surprising, because the Latin-American identity is the product of an amalgam of traditions under permanent construction.

In a temporal dimension, processes are generated to implement a policy without canceling the previous ones, some coexisting, while others are hybridized to adjust to the new interpretation.

The result is a decoupage, where the speech is organized to be fulfilled despite this fragmentation. Because at the same time actors struggle to assert their own interests or ideas, they also seek to differentiate themselves from the individuals and groups that operate outside the space defined for (and by) the public policy.

# Defense Spending and Inequality

Hamid Eltgani Ali
School of Public Administration and Development Economics, Doha Institute for Graduate Studies, Doha, Qatar
School of Global Affairs and Public Policy, The American University in Cairo, Cairo, Egypt

## Synonyms

Reduction of defense spending; Restraining military expenditure

## Definition

Restraining military spending means reduction in military spending necessitates by curbing the ambitions it serves.

Peace Dividend: Saving accrued from reduction in defense spending.

## Introduction

The enduring prioritization of military spending across much of the world gives natural rise to questions about its causes and how to finally achieve reductions. Restraining military spending is essential for human security and world peace, but the reality is different since the end of the WW II until today, the defense spending upward patterns did not change, human society continues paying the price in lives and treasures. According to the Stockholm International Peace Research Institute, the world spent $71.304 trillion on armaments between 1948 between 2018 in constant dollars. If military spending during this period had remained steady at $1.093 trillion per year – roughly equivalent to the level at the end of the Cold War – the world could have saved $7.596 trillion, or $542 billion per year. These yearly savings, which are roughly equivalent to all United States defense spending in 2003, could have substantially benefitted social and economic development if they had been committed toward programs in these areas. Instead, as shown in Fig. 1, defense spending rose steadily through these decades, reaching its highest level in 2018 at $1.738 trillion.

Even as the end of the cold war transformed the international security landscape, States continued allocating resources to military-industrial sectors that were vying to safeguard their historical rights and privileges. Since then, these sectors have been leveraging technological advances to support new military doctrine and supply new types of arms, driving up the costs of new weapon systems and creating pressure for Governments to increase military outlays. Meanwhile, in-kind military assistance from advanced countries effectively subsidized weapons purchases for recipient countries that otherwise could not have afforded them. The resulting increases in military expenditures reduced the availability of funds for social and economic development, producing significant long-term impacts on peace and security.

These extreme opportunity costs to date underscore the need for new action to restrain military expenditure through curbs on arm producers, particularly in advanced industrial countries that reduced their defense burden only marginally at the end of the cold war. A proactive effort by the highest military spenders could have an outsized impact in restraining defense expenditure across the rest of the world.

The next section of the paper will discuss the country reasons for resisting restraining defense spending. The following section presents how to restrain military spending while maintaining security in developed countries, which are responsible for 90% of worldwide military spending. The following section will examine how to restrain military spending through technological innovation and curbs on so-called "rent-seeking" behavior, by which cronyism and corruption contribute toward distortions in government spending. The article will then conclude by presenting several proposals for the consideration of Governments and relevant stakeholders.

## Challenges for Restraining Defense Spending

Why do some countries resist such reductions? External and internal threats, whether real or perceived, can prompt military spending in anticipation of potential conflicts, particularly where the vulnerability of resources to rebels or neighboring countries may appear to pose a greater economic gamble. This is applicable to countries such as Iran and Saudi Arabia and current blockade of Qatar by neighboring countries. All are about the access to the resources and fears of the external threats. Additionally, Governments with access to wealth and advanced technology may predicate various strategic objectives on the pursuit of military hegemony, encouraging increases in defense spending. The size of a country's economy, the traits of its leaders, and the broader international security context also play a role; considerations in this regard include the existence and severity of current disputes as well as the military spending decisions of allies and adversaries, including those anticipated in the future (Nordhaus et al. 2012).

Other common obstacles to reductions include the political influence of entrenched military industries – with their webs of associated corporations, contractors, and lobbyists – as well as institutional interests resistant to smaller standing armies and streamlined bureaucracies. In developing countries, where the army is often a governing force entrenched in the domestic economy, disrupting the military's codependent relationship with business can pose a significant challenge in the absence of sustained international pressure.

## Restraining Military Spending and Security

This section will explore the potential for limitations on defense spending to contribute to economic development, economic equality, and global security.

Recent scholarship has highlighted yielded ample evidence that high military spending accelerates the arms race at the expense of social welfare, underscoring the potential for military savings to be invested in social programs to positive effect. Countries tend to accelerate or reduce their defense spending together in a "bandwagon effect," and the major industrial powers – responsible for 90 of the world's military spending from 1970 to 2018 – hold considerable power to help restrain the arms race.

### Military Spending, Economic Growth, and Inequality

A watershed study by Knight et al. (1996), and others by Smith (1995), Dunne (1995), and Kollias et al. (2007), produced consistent estimates of the growth-retarding effects of military spending through its adverse effect on capital formation and resource allocation. These

researchers found, in short, that military spending contributes relatively little to broader economic growth, thus retarding growth as it lowers the availability of capital, increases the cost of borrowing, and starves private enterprise of needed funds.

Meanwhile, a substantial body of literature has uncovered a robust relationship between military spending and economic inequality, showing that rising military spending negatively impacts economic inequality, growth, and per capita income in rich and poor countries alike (Ali 2007, 2012; Lin and Ali 2009). Although progressive tax structures and spending in areas such as health, education, and pensions can help address these economic problems, unconstrained military spending tends to crowd out such social spending while forcing tax rates to remain at comparatively high levels. States that accept such a trade-off are likely to invoke national security as a justification for the continued prioritization of this defense programs over social and economic development.

Yet where this policy priority has impeded on economic and social development, social tension and ethnic conflict can result, sometimes prompting further spending on military assets for domestic use (Ali 2011). As economic inequality increases, military spending should be expected to rise and vice versa (Ali 2007). Developing countries have been particularly vulnerable to this dynamic, sometimes resulting in conflicts that drag on for years and claim significant resources. The war in Darfur, for example, consumed up to $5 billion a year for more than a decade, and it may have been averted through $500 million in infrastructure improvements (Ali 2014).

Global military spending, as a percentage of gross domestic product, has consistently tracked economic inequality as measured by the Theil Index. As shown in Fig. 2, the levels of military expenditure and economic inequality rose together until 1973 and then again from 1980 until 1991, when military expenditures began to fall and inequality followed soon after. Military expenditure and economic inequality began to rise again in the aftermath of 11 September 2001, a period that included the second Gulf War and the invasion of Iraq. Then from 2009 to 2014, these levels fell again amid a decline in oil prices and the global economic crisis, despite a temporary jump in military spending by most Middle Eastern and North African countries following the 2011 Arab Spring and a similar international response to the Russian Federation's 2014 annexation of Crimea.

D

### Impact on Global Security

Military spending cannot ultimately achieve peace. As developed countries increase their defense expenditures, they drive higher outlays elsewhere, increasing the risk to international security. As defense spending and weapon procurement accelerated during the cold war, for example, certain hosts of NATO military assets in the Gulf region increased their military spending to provide logistical support in the event of a major conflict. Even poor countries with strategic locations allocated significant portions of their foreign aid from industrial countries for military purposes. These major defense allotments never achieved peace; rather, they accelerated regional conflicts and civil wars. In other words, aid that could have supported economic development was instead crowding out private capital and adversely affecting capital allocation to civilian industries (Ali 2014).

The reduction of defense spending by leading industrial countries during the Cold War had a positive effect, encouraging reciprocal steps by regional powers to create an environment conducive to further reductions. This process can help divert attention toward economic development as a vehicle for improving global security.

### Impact on Regional Security

Restraining the regional arms race and conflict, there is a need for regional-level political order. Strengthen the economic ties and regional cooperation by the regional power facilitates reduction on arms race. In the absence of an effective regional-level political order to help keep the peace, any increase in the material wealth of a developing State is likely to encourage an appetite for aggression that wealthier countries will seek to satisfy, whether to provide markets for their arms exports or to protect indigenous resources in

Data source: SIPRI and University of Texas Inequality Project.

**Defense Spending and Inequality, Fig. 2** Global economic inequality measured by Theil Index and military expenditure as percentage of GDP (1963–2015). (Data source: SIPRI and University of Texas Inequality Project)

which they have a financial interest. The developing country is likely to pursue military spending in either case, as its growing income lowers the opportunity cost of acquiring more expensive weapons.

Governments in Asia steadily increased their defense spending from 1949 to 2018, reflecting the effects of increasing wealth concentration. Asian countries spent $12.5 trillion during this period, or 17% of worldwide defense outlays. The rentier states in the Middle East are spending on social welfare and defense. The per capita military spending is the highest in the world due to smaller size of their populations. In addition, the region went through series of wars before and after the cold war resulted in higher defense spending. For example, Israeli-Arab conflict, the Iraq-Iran war, the Gulf war I and II, and recently the Arab Spring, all contributed to higher regional defense spending.

As shown in Fig. 3, Asia and each of its subregion, have seen increasing defense spending, particularly in the Middle East, followed by South Asia.

In Africa, the sub-Saharan countries have also been increasing their defense spending. They realized a peace dividend from 1980 to 1987, 1992, 1994, and 1995, then resumed an upward trend that reached a peak of $22 billion in 2014, falling to $19.1 billion in 2018. North Africa has spent far less on defense than sub-Saharan Africa. Comparing to sub-Saharan countries, we have few countries in North Africa. In addition, Morocco and Tunisia spend less, while Egypt, Libya, and Algeria are less transparent in reporting defense spending. North African countries' peace dividend lasted from 1982 to 2000, starting a decade before the end of the Cold War. Their highest defense spending was $20 billion in 2014, and the lowest was $13 billion in 2018 (Fig. 4). This taxonomy of African countries to two regions is illustrating the fact that poor countries are spending higher than the lower-middle income countries.

The arms race is the underline trends across the regions; the state craft of using force is dominating the conversation with catastrophic results for the human security, particularly in Asia and the Middle East. Overall, regional security is enhanced through cooperation, political dialogue, and shared economic development. Constructive engagement between and within

Data source SIPRI (2019).

countries reduces the need for military means to achieve political and economic ends, and restraining defense spending would make the Middle East, North Africa, and Asia safer and more prosperous.

Yet as countries build their military capacity, they face a growing temptation to use force and test the potential of military domination. The shortcomings of this approach are clear: despite higher military spending, the Middle East region

is less secure than at any time in decades, with the exception of the Gulf War. Spending more on militaries does not guarantee security; in contrary, it complicates regional confrontations in a manner necessitating yet more military spending. Peace cannot be realized through military spending; it can only be pursued by a mutual a political decision to achieve regional security through political dialogue rather than military means.

### Potential Benefits for National and Human Security

Following up to nature of arms race regionally and globally any conflict will be detrimental to human security and its economic welfare. People should be free from fear. The 1994 Human Development Report highlighted two major components of human security: "freedom from fear" and "freedom from want." This section will focus on the fundamental right to live free from fear, which has been continuously threatened by the accelerating defense spending of States, including for the production of weapons of mass destruction. Armament and militarization deprive people of the right to engage in dialogue and exercise choices safely and freely. Increasing levels of defense spending and armament also heighten the potential armed conflict or war, posing a direct threat to human security. For example the Saudi-Iranian conflict fought in Yemen, Syria, and Lebanon directly or by proxy resulted in detrimental impact on human security in Yemen and Syria.

In light of the threat posed to human security by accelerating defense spending, it follows that restraining defense spending can benefit human security at domestic and international levels. Prospective reductions to military spending should therefore the UN development agencies examined both as a tool to fund development efforts and as a contribution to reducing tensions and minimizing armed conflicts (International Peace Bureau 2012).

Savings from defense spending have the potential to benefit human security both directly and indirectly. Reductions in armaments could reduce civil wars and save lives while potentially freeing resources to fight poverty, promote food security and provide education opportunities gap, and help economic growth. Other benefits to human security may be less direct, including from additional economic growth that could result from lower tax burdens.

Yet while any savings from military spending reductions would ideally be redirected to benefit human security, such reallocations are far from guaranteed. There will therefore remain a need for strong grassroots advocacy pressuring Governments to responsibly spend resources released from the military sector (International Peace Bureau 2012).

### Restraining Military Spending through Innovation and Curbs on Rent Seeking

Unchecked military spending can foster forms of cronyism and corruption that distort the size and structure of government spending, ultimately contributing to spending increases that may retard economic growth. Highlighting the scope of this problematic "rent seeking" behavior, one study of military spending by States from 1984 to 2006 correlated the presence of corruption with higher spending on arms imports (Hudson and Jones 2008). One contributing practice involved the hiring of former military personnel by arms manufacturers, systematically undermining incentives to serve the public interest in contract negotiations (Lieberson 1971).

These findings suggest that any successful strategy to rein in excessive military spending must succeed at finding and eliminating conflicts of interest that generate waste, abuse, and fraud. Specifically, States may wish to consider establishing moratoriums on the hiring of former military personnel, as well as financial incentives for military retirees not to work with contracting corporations.

Innovative management techniques can also reduce overhead costs and opportunities for corruption in weapon acquisition programs, and innovative applications of new technology are essential in this regard. Using satellites and strategic air assets – along with the information systems needed to support network-centered warfare – can reduce bureaucracy and any associated need for draconian management systems. Additionally, the contract bidding process should be automated to weigh the ability and merits of

contractors with minimal intervention. The initial costs of these systems are expensive, but in the long run due to the economic of scaling and learning by doing and new innovations, all will be driving down the operation costs. Updating these procurement systems can help generate savings that, if reinvested in the economy, will unleash the potential of the private sector to grow and create more jobs.

## Conclusion

Restraining defense spending can benefit economic equality and growth while helping to ensure fundamental human rights, including the right to live free from fear. Reductions in military expenditures can also help reduce tensions, minimize armed conflicts, and provide funds for development.

Yet military spending can still be restrained by pursuing technological innovation in specific areas, by ending waste and abuse and by curbing corruption in military contracts. By taking action in these three areas, States can contribute toward a peace dividend beneficial not only to global and regional security but also economic and social development as well as human security.

Grassroots movements will be essential to any successful international effort to restrain defense spending. Donor countries and organizations should exert sustained pressure to lower defense spending in war-prone countries, and local communities should debate how to balance competing demands for economic development and defense.

# Deficit Control

Enrico Guarini
Department of Business Administration, Finance, Management and Law, University of Milano-Bicocca, Milan, Italy

## Synonyms

Budget balance; Budgetary control; Budget rules; Fiscal governance; Fiscal responsibility; Fiscal rules; Public budgeting; Public deficit

## Definition

A government deficit occurs when public expenditures are greater than revenues. Running a

deficit essentially means that the government resorts to borrowing as to maintain higher spending without increasing taxes. This leads to the accumulation of public debt.

## Introduction

There are different types of government deficits and methods of measuring them. A deficit, for example, may be caused by a temporary shortfall in revenues or may occur during economic downturns because of gross domestic product (GDP) reduction. Additionally, government deficits occur when tax revenues are insufficient to finance public investments (e.g., building roads, hospitals, schools, etc.), and the consequent imbalance must be covered by debt.

However, governments can intentionally choose to run systematic deficits. In some cases, this choice is related to public policies aiming at stimulating the economy during recessions by increasing public spending and reducing taxes. In other cases, government deficits allow for political benefits. For elected politicians to maintain a deficit and increase borrowing is generally less politically risky than reducing it by increasing taxes or reducing public expenditures and investments. However, running structural deficits is not without risks in the long run. Revenues persistently lower than expenditures produce accumulation of debt and interest, which might result in increasing future negative cash flows and, as a last instance, the inability of the government to pay its obligations. Public debt means a commitment from the government that future revenues must balance future expenditures to pay back the loans and associated interest (debt service). Hence, in order to avoid future financial unsustainability, government deficits and borrowing should be limited and managed carefully (Bergmann 2009; Posner and Blöndal 2012).

This issue has policy implications at both micro- and macro levels. At the microlevel, i.e., the individual public entity running operations, if the debt is unsustainable in the long run, the public entity may default and require a bailout by upper levels of the government or by supranational institutions. At the macrolevel, i.e., the government system as a whole, highly recurring public deficits can cause fiscal instability and lower growth rates in the economy.

In a multilevel government system, these two perspectives are strongly interlinked. The budgetary outcome of the general government depends on the budgetary positions of all component entities. Whatever the number of government tiers, the control of aggregate deficit requires rules to ensure the fulfillment of financial responsibility of lower-tier governments (Oates 1972). This is particularly important in the public sector because of the size of the government units and the consequent risk of default on the economy (Breton 1977; IMF 2009).

Over the years, fiscal crises have shown a dramatically close link between the fiscal instability and the real economy and emphasized the need for early deficit and debt control in several countries, particularly developing ones (Posner and Blöndal 2012). The size of deficits can vary depending on economic and political contexts. A way to reduce a government deficit is to increase tax revenues or cut government expenditures. However, this is not an easy task. First, it could be difficult for politicians to increase tax rates or reduce government spending. Second, at the macroeconomic level, fiscal tightening can cause lower economic growth, which, in turn, can result in a higher deficit because of the lower tax base and revenues.

Consequently, in order to secure the control of government deficit on a permanent basis, a financial control system is needed at national and subnational levels. This system is fundamentally based on financial rules – also known as fiscal rules in the public finance literature (Kopits and Symansky 1998) – which set financial constraints on government budgets, such as by limiting the deficit, borrowing, and debt, or a major component thereof.

Once fiscal rules have been adopted, the budget must be prepared and executed according to these rules. Budgets allow public officials to preemptively check the expected balance between expenditures and revenues and, during the fiscal year, provide a yardstick for execution if adjustments are necessary (Anessi-Pessina et al. 2012).

The deficit control system, which is also referred to as "fiscal governance," has two components: first, the financial rules set to enhance budgetary discipline within a government and second, all the fiscal, legislative, and procedural rules set for the coordination and control of budgetary policy across layers of the government (central/local) at national or supranational levels.

In subsequent sections, this entry presents some theoretical explanations for the government deficit and discusses the main features of deficit control systems.

## Definition of Government Deficit

Government deficit intersects with other key concepts developed in public financial management literature. Ensuring the financial sustainability of government activities over time is a common explanation for the need to control public deficits. However, how the deficit is interpreted and measured in theory and practice varies significantly, depending on different measurement perspectives. In order to understand these differences, first, it is helpful to outline the overall budget account's accounting basis and structure. Indeed, as previously explained, the deficit comes from the budget balance, which expresses the difference between revenues accomplished and expenditures.

Differences in deficit size emerge from how it is measured. First, it depends on the accounting basis used in the preparation and presentation of the budget, i.e., cash or accrual, or some modification thereof (Jones and Pendlebury 2010). Second, it varies depending on what is counted in the balance (Dafflon 2002). Regarding the accounting basis, the differences lie in the timing of recognizing expenditures and revenues. By using the cash basis, revenues are recognized only when cash is received, and expenditures are recorded when cash is disbursed. Long-term assets are not capitalized, and no depreciation or amortization is recorded. In this case, the budget balance shows the yearly cash flow and the deficit results from cash outflows exceeding cash inflows. Under the cash basis, outstanding obligations, in the form of contracts or orders issued, are not reflected in the budget balance, and hence the deficit might be underestimated. To avoid this shortcoming, most government budgets use separate obligation-based accounting, which records an obligation against available funds when a commitment (i.e., a liability) is created.

In accrual systems, revenues are recognized when earned and expenditures when they are incurred (and not only when cash is received or paid) (OECD 1993). Expenditures may also include asset depreciation and cost estimates that will be outlays in the future (i.e., maintenance, credit losses, etc.) (Chan 1999). However, a high degree of differentiation exists in the features of budgeting and accounting systems across countries (Brusca et al. 2015). Some variations deal with the use of accounting bases, which might take different forms between a pure cash basis and a full accrual basis (these are often referred to as the "modified accrual" basis or the "modified cash" basis of accounting).

Finally, there are ad hoc international statistical standards and methodologies for measuring the government deficit in national accounting, namely, the system of national accounts (SNA), which is used for assessing and comparing the economic performance of countries. While sharing many common principles with the accrual basis of accounting and administrative data from government accounting systems, national accounts are based on economic concepts and statistical estimates (Jones 2003). The alignment between the two systems requires some amount of adjustments which is an issue for the reliability of government deficit and debt aggregates reported in the national accounts (Jesus and Jorge 2016).

Cash and accrual measures of the government deficit serve different purposes but provide complementary information for the assessment of government's financial performance. From the perspective of microlevel internal financial management, a cash flow deficit does not necessarily mean debt if the government has accumulated cash reserves. Conversely, from the perspective of the control of public finances at the macroeconomic level, the cash flow deficit is a proxy measure of the public sector's borrowing needs in the

economy, thus making it useful for understanding the short-term economic impact of fiscal policies.

The accrual deficit is the amount by which accrued expenditures exceed accrued revenues. It approximates liabilities that will have an impact on the government's fiscal condition in future years. Hence, the accrual basis provides a more comprehensive view of the government's financial performance and the cost of government activities (IFAC 2011).

Figure 1 shows the basic elements of the government's budget balance in a general (unified) budget account. The illustrated budget structure adopts a cash-based/financial control logic, since the goal here is to show the government's investing and financing activities and borrowing need estimates. Debt service has been included in the current budget balance to clarify theoretical issues.

The budget balance can be split into the operating or current budget and the capital budget. The operating budget deals with recurrent yearly costs and income related to the delivery of public services and includes operating revenues, such as taxes, transfers, and service fees, and annual expenditures items, such as salaries and wages, welfare services, interest payments, capital assets amortization, and other expenditures. The capital budget deals with the money needed for long-term investments and includes capital revenues and expenditures, mainly for land, highways, and buildings (Goode and Birnbaum 1956; Webber 2007). One important issue here is how the debt service item is considered in the balance, as it can be defined in a number of ways depending on the budgetary and accounting system in use in each country and level of government (Dafflon 2002). The debt service should include both interest payments and annual debt repayment, but sometimes the latter is not counted in the balance.

Moreover, while interest payments are considered in the current balance, the annual debt repayment can be included in the current or in the capital budget balance or as a separate budget item.

The budget balance components are not neutral when it comes to limiting the deficit; this can be

**Deficit Control, Fig. 1** Budget balance aggregates for deficit measurement. (Source: Author's illustration)

referred to the current budget balance or the capital budget balance, as well as to the overall result of the budget balance, without distinction between current and capital account. As a result, the deficit varies depending on how the requirement of a balanced budget is applied. If the requirement is just for the current budget balance (aggregate "d" in Fig. 1), then there might be a capital deficit (balance "g" in Fig. 1) and debt, with borrowing need corresponding to the net balance of the capital budget minus the current budget surplus, if any. This means that governments are allowed to borrow only for capital expenditures and not to fund operating deficits (the so-called golden rule). If the requirement is for the entire budget (current and capital), then no deficit nor new borrowing is allowed, and hence, both current surplus and capital revenue have to be used to finance investment (capital expenditure) in case of an imbalance in the capital budget.

In the European system of national and regional accounts -ESA 2010 (European Commission 2013), operations are recorded on an accrual basis, and the overall result of a country's general government balance is calculated in terms of the primary balance and structural balance, i.e., the primary balance adjusted for the effects of the business cycle and one-off measures. The primary budget balance equals the total government budget balance (current and capital budget), before interest payments, without distinction between current and capital accounts and not including debt repayment (see again Fig. 1). For example, the balanced-budget fiscal rule for member states under the European Union (EU) deficit control mechanism (the stability and growth pact (SGP)) is calculated from the previous balance, but net of interest payments; this result, if negative, should not exceed 3% of GDP. The structural budget balance is the key indicator used for the assessment of EU member states' medium-term fiscal objectives.

## Theoretical Perspectives on the Control of Government Deficit

Ensuring financing for long-term capital expenditures is considered by public financial management theories as a justification for deficits and government borrowing when other revenues are insufficient to satisfy population needs (Bonner 1972; Devas et al. 2008). By borrowing, the basic assumption is that the future tax base growth or user charges will offset the increased liability for debt service. In other words, the debt burden measures the amount of taxes that future taxpayers are required to provide in order to finance outstanding debt service. This is consistent with the public finance principle of intergenerational equity, which recommends the benefits and associated costs be spread over the life of the capital facilities (Musgrave 1959; Buchanan 1967). However, without constraints, governments may have the incentive to generate excessive deficits in response to service demands from current voters, leaving the burden of borrowing to future taxpayers. A theoretical explanation for this fiscal behavior is the "common pool" problem. Literature shows that, in a decentralized system, when local governments are highly dependent on central government transfers, they tend to incur a deficit because their additional expenditure is paid by all taxpayers (Persson and Tabellini 2000).

According to the public choice theory (Buchanan et al. 1978), government deficits occur because of asymmetry of information and moral hazard problems that arise between the politicians (i.e., agents) and the voters (i.e., principal). Elected politicians may have an incentive to spend more in a year than taxes collected in that period, since voters do not have enough information to fully understand the intertemporal budget constraints resulting from deficits (Buchanan and Wagner 1977). This incentive is particularly high before elections, when politicians can benefit from current spending financed by debt and shift the fiscal burden to future generations (Nordhaus 1975). The debt can be also used by the incumbent politicians to condition the policy options of the incoming elected officials if they expect to lose the elections (Alesina and Tabellini 1990).

Deficit can also result from "moral hazard" behaviors of local governments, which tend to overspend in case of soft budget constraints, as

they expect a bailout from the central government in case of financial distress.

Apart from the creation of government deficits, an important problem in public financial management is the impact of deficits on the financial viability of governments. On this issue, public sector accounting and financial management literature have developed several theoretical propositions on how to measure and assess government deficits (Bergmann 2009; Levine et al. 2012; McKinney 2015). At the basis of these propositions lies the core principle of "financial sustainability." Although there is no generally accepted definition of the term, this concept can be clarified by taking into account the three elements mentioned above: expenditures (i.e., public services), taxation, and impact on future generations. For example, the International Public Sector Accounting Standard Board (IPSASB) has clarified that the long-term fiscal sustainability of a public sector entity is its "ability to meet service delivery and financial commitments both now and in the future" (IPSASB 2013). Hence, financial sustainability means that to fulfill its mission, a government should be able to achieve an adequate operating surplus over time, that is, revenues should be large enough to cover expenses on an accrual basis, as well as an adequate liquidity, i.e., the ability to meet current liabilities when due (cash basis) without systematically relying on financial support from the higher government levels or from the market (Schick 2005; Hendrick 2011). Within this perspective, a temporary cash flow deficit is not negative as far as the operating balance is maintained in surplus over time and adequately sustains the annual debt service. Conversely, systematic operating deficits (revenues lower than expenditures) and an excessive level of debt would inevitably produce increasing cash flow deficits, new debt, and future losses due to increasing interest. The continuous inability to pay obligations could lead to default.

An indirect form of government deficit control is also that exercised by financial markets, which impose higher borrowing costs (i.e., interests) in case of perceived unsound financial management (Ter-Minassian 2007). In this respect, countries that rely mainly on the control of financial markets, such as Canada, the United States, and Australia, tend to have less formalized or no fiscal rules. The problem with this type of control is that it could not allow early adjustments of financial behaviors unless a financial crisis becomes evident.

To avoid (or limit) deficits and promote long-term financial sustainability, several countries have established deficit control systems across government tiers, based on institutional budgetary constraints, i.e., fiscal rules (Sutherland et al. 2005; Ahmad et al. 2011). Fiscal constraints can be framed in different ways. Budget balance and debt rules introduce limits on the deficit or debt of entities of the general government sector on a yearly basis or over a given period. Alternatively, expenditure and revenue rules impose constraints on certain categories of government expenditures or tax revenues. Fiscal rules are often translated into numerical targets or ceilings, but they should not be confused with general fiscal targets adopted by governments for policy measures, which may be set on an annual basis and revised frequently without any restriction. What distinguishes a fiscal rule from the usual fiscal target is that there should be a quantitative constraint on one of the key general government budget balance aggregates and that this constraint should be set for a certain period (medium to long term) (Kopits and Symansky 1998). An example of permanent constraint is a deficit ceiling as a percentage of GDP, as in the case of EU's SGP for member states. Fiscal rules can be adopted by governments at the supranational, national, or subnational levels. These rules have a clear procedure of implementation, monitoring, and enforcing, as well as explicit sanctions if the rule is not followed.

Fiscal rules have gained greater attention in OECD countries since the early 1990s, as the autonomy granted to subnational governments has increased through the decentralization of taxation powers and spending responsibilities. The effectiveness of fiscal rules in driving budgetary outcomes has been largely investigated by public finance scholars (Schick 2003; von Hagen and Wolff 2006). Their research has shown that efficacy depends on a number of features, such as the statutory basis of the rule, the budgetary control

against the fiscal targets, and the existence of corrective mechanisms in case of noncompliance.

Debates on the negative effect that austerity-based fiscal rules have on economic growth have recently emerged as well (IMF 2010). It has been argued that the disadvantage of fiscal rules is that they might be implemented as highly inflexible, so that they could not allow for prompt anti-cyclical behavior.

Another disadvantage of fiscal rules is that they tend to create incentives to evade them through creative accounting. Examples of these practices are several: withdrawal of certain expenditures from the budget, manipulation of estimations for budget preparation, underestimation of expenditures, and exclusion of contingent debts from the budget, such as government guarantees to state-owned companies, to private companies, or to subnational governments (von Hagen and Wolff 2006).

## Deficit Control Systems

Fiscal rules for deficit control can be set in different ways, depending on the level of government, the legal basis of the rule, the time horizon, and the budget account aggregate to be considered (Guarini 2013). Regarding the latter component, fiscal rules put constraints on expenditures, budget balance, or debt level.

### Expenditure Rules

Expenditures are the main source for the deficit and constitute a budget item mainly under direct government control. Expenditure rules set targets on the overall spending ceiling of a government, or major policy areas or types of expenditure (e.g., operational or capital), as well as on specific expenditure items (e.g., salaries, purchase of goods and services, transfers, etc.), thus making public officials fully accountable for their achievements (Mullins and Wallin 2004). The expenditure target can be expressed in terms of a ceiling (real or nominal), or as a maximum growth rate.

The main objective of expenditure rules is to ensure budgetary coordination across government levels through improved expenditure control. At the same time, these rules can be instrumental in limiting the size of the government or prioritizing expenditures. An expenditure rule can be established for the entire general government sector or be differentiated by government level. In order to be effective, expenditure rules require a clear allocation of responsibility for public functions across layers of the government. Overlapping of activities and spending powers should be avoided in order to increase transparency and financial accountability. An adequate degree of tax autonomy for lower levels of government should also be considered to avoid a mismatch in revenue power and spending responsibilities (i.e., the so-called vertical fiscal imbalance) (Sharma 2012).

When designing a ceiling for the growth of public spending, the government has to decide the time horizon over which the target must be achieved and how to ensure compliance. These two issues are interlinked. Multi-annual expenditure targets are more effective than annual ones. An annual expenditure constraint may be easily circumvented by postponing the recording of expenditure items to the following fiscal year. Another common practice is arbitrarily reclassifying expenditure items into aggregates excluded from the ceilings. For example, if the ceiling is put on operating expenditures, government entities can be tempted to reclassify operating expenditure items – such as current asset maintenance into capital spending – and finance them by debt. Another, somewhat different behavior is accounting expenditures off the entity's budget. Conversely, multi-annual expenditure targets may be better embedded in a medium-term financial strategy, thus making budget adjustments more flexible.

### Balanced-Budget Rules

The key financial control mechanism on government deficit is a balanced-budget rule. This rule has a constitutional rank in most countries and requires the government not to spend more than its revenue (Sutherland et al. 2005). The budget aggregate put under control is the overall budget balance or a major component thereof (see Fig. 1).

The balanced-budget rule can be set in different ways, and central and local governments are often constrained by distinct mechanisms. If the rule considers only the current budget balance, a balanced-budget requirement means that the overall deficit (and borrowing) is admitted only to finance capital expenditures.

Sometimes, especially at local government level, the rule might require current revenues to balance current expenditures inclusive of debt service (interest payment plus annual debt repayment). Hence, while new borrowing is allowed only to finance a capital balance deficit, this rule provides an indirect assurance of financial sustainability for the debt level related to current revenues and expenditures. Moreover, this rule is consistent with the principle of intergenerational equity, as taxpayers and beneficiaries bear the cost of interest and debt repayment but benefit from the utility and income generated by the public asset. Indeed, relatively high levels of debt represent a significant call on future revenue flows, thus limiting the government's flexibility to engage in new expenditure on public services or tax cuts.

If the balanced-budget requirement is also applied to the capital budget, then no deficit or debt is allowed, and investments should be financed through own resources. If this rule is applied at local government level, it means that a capital imbalance must be financed by a structural current surplus (i.e., mainly by tax revenues), unless investments are financed by capital transfers from the higher tier or by other nonrecurring capital revenues (i.e., sale of assets, capital fees, etc.). The reason for relaxing this requirement is that it would be contrasting with the principle of intergenerational equity in the sense of an equal distribution of costs and benefits of investments over time (Jones and Pendlebury 2010). This rule might also cause side effects, such as accounting manipulation and the reduction of the local investment capacity (Guarini and Pattaro 2016).

A relevant issue is the time horizon of the balanced budget. There are two general types of government balanced-budget constraints. The first is that the budget must be balanced when introduced by the executive or passed by the legislature. The second is that the budget must be balanced at the end of the fiscal year, so that no deficit is carried forward. If it is just the enacted budget to be balanced, the government may carry over a deficit into the next fiscal year for resolution.

Fiscal constrains set on the budget balance allow budget flexibility, given that adjustments can be made on both sides of the budget. However, when local tax rates are capped by higher governments, this rule is de facto not much different from an expenditure rule. In many countries, governments can revise budgets after they are enacted as to bring them into balance. Such requirements can be either constitutional or statutory, but the former are more effective, considering they are not subject to legislative amendments.

### Borrowing Rules

An indirect way to control government deficit is to constrain government borrowing, especially at the local level. This is achieved in several ways (Kriz and Wang 2012). An example is the requirement of achieving a net operating balance, in that current revenues must balance current expenditures inclusive of debt service (interest and annual debt reimbursements). This rule forces governments to accumulate adequate operating surpluses to fund current expenditures and the debt service. This requirement is more efficient if it has to be achieved at the end of the fiscal year and not just when the budget is enacted.

Another way is to set a ceiling on the cost of debt service. As a result, new borrowing is allowed only if the overall cost of interests on outstanding debt rests below a preset percentage of current revenues. However, this type of rule does not prevent subnational governments from borrowing beyond their debt-carrying capacity, especially in times of low interest rates. Therefore, ensuring sound fiscal behaviors requires a continuous ceiling revision.

Finally, other forms of control are to put an explicit limit on the stock of debt (e.g., debt as% of GDP, such as under the EU's SGP) or on the rate of a new debt creation (e.g., debt growth rate as% of GDP), as well as to require preventive debt authorization from higher levels of government.

## Deficit Control in Multilevel Governance Systems: The Case of the European Union's Stability and Growth Pact

To be effective, deficit control systems should be spread across government tiers. In centralized government systems, the problem of deficit control is almost limited, given that subnational governments might have restricted fiscal autonomy and the central government exerts direct administrative control over their decisions (i.e., spending authorizations). If subnational governments have certain degrees of fiscal autonomy, such as in multilevel governance systems, then the general government's fiscal outcomes are highly dependent on local level financial behaviors. Therefore, the control of the overall fiscal deficit cannot be achieved without the financial responsibility of subnational governments. This requires that their deficit is constrained by a wide range of fiscal rules, which are either self-imposed or imposed by higher government levels. Strengthening deficit control is particularly relevant when supranational commitments on government fiscal performance have to be respected. An example of this type of deficit control system is the EU's SGP, which has been adopted since 1997.

In Europe, fiscal rules were introduced at supranational level by the 1992 Maastricht Treaty, which established the fiscal criteria for the membership of the economic and monetary union (EMU). These rules require general government debt of member states not to exceed 60% of GDP and deficits not to exceed 3% of GDP. In this case, national fiscal rules are imposed by supranational legislation. Each member state must submit a "Stability Program," showing how it intends to achieve a sound fiscal position in the medium term. Multiyear budgetary targets refer to a budgetary position "close to balance or in surplus" and reduction of debt toward the threshold of 60% of the GDP. The Stability Program is subject to a review by the European Commission and updated annually. To prevent the occurrence of an excessive deficit, an early warning can be addressed by the European Council, on the basis of a proposal by the Commission. Furthermore, the Commission can directly address policy advice and recommendations to a member state regarding the broad implications of its fiscal policies (European Commission 2016).

An "excessive deficit procedure" (EDP) is triggered if the deficit breaches the 3% ceiling, except when the deviation is both temporary and small. The Council issues recommendations for correcting the excessive deficit and gives a time frame for reducing it. Noncompliance with the recommendations triggers further steps in the procedure, including the possibility of sanctions. Monitoring government deficits is exercised by the Commission only at the national level, and the existence of different levels of government is not taken into account. This has made national governments accountable for deficits incurred by their subnational entities.

Recently, the EU's fiscal framework has been strengthened by the new Treaty on Stability, Coordination, and Governance signed on March 2012, the so-called fiscal compact. Two relevant requirements have been introduced. First, member states with debt over the 60% ceiling must follow a new numerical budgetary rule requiring the debt ratio to fall each year by an amount of one-twentieth of the debt excess. Second, a balanced-budget rule requiring the budget position be "balanced or in surplus" must be included in national laws and be of binding force, preferably constitutional. The SGP rules apply to the general government, with each country being responsible for distributing the fiscal target internally among government tiers. Most countries settled their domestic deficit control system with strategies ranging from top-down to cooperative target-setting arrangements (European Commission 2009). Some member states (e.g., Austria, Belgium, and the Netherlands) have implemented a cooperative approach for deficit control between government tiers with budgetary targets set on a multiyearly basis. These arrangements are more flexible and allow renegotiation of fiscal targets over time. Other countries with a Napoleonic administrative tradition (e.g., France, Italy, Portugal) have chosen to impose fiscal rules set up in the national law and based on a system of control for legal rules. Italy, for example, has decided to replicate the SGP's medium-term objective of "close to balance or in

surplus" at local government level, and sanctions are applied in case of noncompliance (Guarini and Pattaro 2016).

## Conclusion

Deficit control is an issue at the core of financial management in both private and public sector organizations. With the growing challenges of fiscal crises and increasing demand of public services, the need for a sound financial behavior from governments has reached renewed interest in theory and practice. In multilevel government systems, public deficit at the macroeconomic level may become highly dependent on the behavior of individual entities and often more difficult to control because of "moral hazard" actions and bailout expectations at the microlevel. Despite financial sustainability being recognized by theories and practice as an important principle of public financial management, it cannot be taken for granted. Additionally, fiscal responsibility driven by financial markets cannot be an efficient mechanism to that end.

Therefore, to avoid excessive public deficit and debt, it is necessary to arrange multilevel control systems based on fiscal rules, which can be either self-imposed or imposed by higher levels of government (national and supranational). Fiscal rules act by imposing constraints on budget balance aggregates, expenditures, or debt levels. Preset sanctions may supplement the control mechanisms in case of noncompliance. Empirical evidence shows that fiscal rules do have an influence on deficit control, and they affect financial markets' reactions. To this aim, deficit control systems should be binding and credible. While fiscal rules have become common in deficit control systems in most countries, an area where theory development is particularly needed relates to the design of constraints at the macrolevel in a way that it reinforces rather than threatens financial management autonomy at the microlevel. Rules that are much too rigid or that require onerous adjustments (e.g., austerity measures) can be circumvented by governments or may have counterproductive effects on the society. To this end, not only sanctions but also incentive-based rules should be developed.

# Defining Corporate Governance: Shareholder Versus Stakeholder Models

Collins G. Ntim
Department of Accounting, Centre for Research in Accounting, Accountability and Governance (CRAAG), Southampton Business School, University of Southampton, Southampton, UK

## Synonyms

Corporate governance; Shareholder perspective; Stakeholder perspective

## Definition

Corporate governance has generally been defined as the "*. . .system by which companies are directed and controlled*" (Cadbury 1992, s.2.5).

## State of Art: Defining Corporate Governance

The last three decades has seen the term "*corporate governance*" emerged clearly as an independent field of study (Gillan 2006). Its scope has also witnessed great expansion such that it is now an amalgam of different disciplines, including accounting, economics, ethics, finance, law, management, organizational behavior, and politics, among others, with no universally accepted definition (Mallin 2007). As a corollary, there exist a large number of definitions of corporate.

Despite the existence of heterogeneous definitions, however, researchers frequently classify the existing corporate governance definitions as either "*narrow*" or "*broad*." As a prelude, the narrow-broad dichotomization is based on the extent to which a corporate governance regime essentially focuses on satisfying the parochial interests' of shareholders or meeting the broader interests of diverse societal stakeholder groups (Sternberg 2004).

The Cadbury Report (1992, s.2.5) narrowly defines corporate governance as being concerned with the "*system by which companies are directed and controlled*." This definition suggests that in order to maximize the wealth of owners, three key corporate governance structures of the corporation emerge, namely a general assembly of shareholders, a board of directors, and an executive management. In this case, the corporation is primarily accountable to shareholders, and as such they have the power to appoint directors and to satisfy themselves that the right governance mechanisms have been instituted.

Also, and at least in theory, the shareholders have the power to reject decisions of the board or remove them from office in a general meeting. By contrast, the board of directors' has the responsibility to ensure that the company is properly governed. These responsibilities include setting the company's strategic aims, appointing or firing the management team, supervising the management team, and reporting to the owners of the company on their stewardship.

In short, a governance structure of a firm is considered as "*narrow*" if it mainly concentrates on how key internal governance mechanisms interact to maximize its value primarily for the benefit of shareholders instead of enhancing the interests of other potential stakeholder, like customers, employees, creditors, suppliers, and the local community, among others.

Contributing to the foreword of the World Bank Report (1999, p.vii), Sir Adrian Cadbury defines corporate governance broadly as being "*. . .concerned with holding the balance between economic and social goals and between individual and communal goals. . .the aim is to align as nearly as possible the interests of individuals, corporations, and society.*" This definition implies that corporate governance goes beyond the immediate internal corporate structures to include external corporate governance mechanisms and stakeholders. Typically, and as has been explained above, internal corporate governance structures may include the general assembly of shareholders, the board of directors, and the executive management. By contrast, the external corporate governance mechanisms may consist of the legal system; the market for managerial labor and corporate control; regulators; local communities; cultural, political, social and economic policies; and institutions within which corporations operate.

In this case, the corporation is considered to be a social entity that has accountability and responsibility to a variety of stakeholders, encompassing shareowners, creditors, suppliers, customers, employees, management, government, and the local community (Mallin 2007). The aim of corporate governance is to facilitate the efficient use of resources by reducing fraud and mismanagement with the view not only to maximize

but also to align the often conflicting interests of all stakeholders.

In brief, and in contrast to the "*narrow*" characterization, a "*broad*" corporate governance structure's central preoccupation is to examine how both external and internal governance mechanisms can be run to maximize firm value and/or performance for the mutual benefit of shareholders and other potential stakeholders.

## State of Art: The Main Corporate Governance Models

This section discusses the state of art knowledge relating to main corporate governance models within the extant literature: the "*shareholding*" and "*stakeholding*" models. Specifically, the general theoretical assumptions, characteristics, solutions, and weaknesses of the "*shareholding*" and "*stakeholding*" models will be discussed. Table 1 below contains a summary of the theoretical assumptions, features, and solutions underlying the "*shareholding*" and "*stakeholding*" models of corporate governance. For brevity and comparability purposes, they have been put together, and therefore will be referred to throughout the rest of this entry. The first subsection of this section will examine the "*shareholding*" model, while the following subsection will present the "*stakeholding*" model.

## The Shareholding Model of Corporate Governance

### Theoretical Assumptions, Features, and Solutions of the Shareholding Model

To begin with, and as Table 1 shows, the shareholding corporate governance model is usually common in the UK, USA, and other commonwealth countries. Central to the shareholding corporate governance model is the doctrine of shareholder value and primacy. It suggests that a firm must be run to primarily advance the interests of its owners. This is based on a basic assumption that ownership is separate from control in an Anglo-American model (Table 1). That is, in this corporate governance system, the providers of capital (owners/shareholders) surrender the day-to-day management (control) of the business to a group of managers, consisting of a "unitary" board of directors and executive management, who are frequently not owners of the corporation themselves. Of close relevance is that through multiplicity of shareholders, ownership in this corporate governance model is quite often relatively widely diffused (Berle and Means 1932).

A major implication from dispersed ownership is that the power of shareholders to exercise control over the way their business is run is greatly impaired (Table 1). This raises serious agency problems, which is the central theoretical framework that underpins this entry. Briefly, however, the agency theory suggests that since shareholders (principals) have to delegate the control of their business to a few directors and managers (agents) to run the company on their behalf, there is a potential risk that directors and managers will pursue their own interests to the detriment of the eventual owners – shareholders (Smith 1776). This is also based on the premise that managers are both opportunistic and rational such that, on average, they are more likely to pursue their self-interests than those of shareholders (Weimer and Pape 1999).

In response, the shareholding model offers several solutions to the agency problem. Firstly, it suggests that restrictions on factor markets must be removed in order to encourage competition (Letza et al. 2004). Secondly, it calls for the introduction of a voluntary corporate governance code of ethics and conduct, which is usually underpinned by the universal business principles of accountability, discipline, fairness, independence, responsibility, and transparency to regulate director and managerial behavior (Cadbury 1992). Thirdly, it recommends the strengthening of the managerial incentive system by instituting performance-linked executive compensation schemes to help align shareholder-managerial interests (Weimer and Pape 1999). Finally, it calls for the introduction of efficient contracts to

govern the relationship between owners of capital and labor (Letza et al. 2004).

By contrast, the shareholding model rejects external interventions and additional obligations imposed on corporations by government and central authorities because it may distort free market operations (Table 1). Rather, it sees a firm's existing governance arrangements as the outcome of a bargaining process, which has been freely entered into by corporate insiders and outsiders

**Defining Corporate Governance: Shareholder Versus Stakeholder Models, Table 1** Summary of the theoretical assumptions of the shareholding and stakeholding models of corporate governance

| Summary | Shareholding model | Stakeholding model |
|---|---|---|
| *Theoretical assumptions* | | |
| Purpose of corporation | Maximization of shareholder value | Maximization of all stakeholders' wealth |
| Problem of governance | Agency problem | Absence of stakeholders' participation |
| Cause of problem | Shareholders do not have enough control | Governance failure to represent stakeholders' interests |
| Background | Separation of ownership and control | Different style of capitalism |
| Assumptions about causation | Self-interest human behavior | Traditional mentality of private capitalism |
| Type of economic organization | Rational economic unit with profit motive | Social economic unit with stakeholder welfare motive |
| Proposition | Market efficiency of economy | Social efficiency of economy |
| Rejection | Any external interventions | The principal-agent model |
| Source of discipline | External market forces | Internal social forces |
| *Major features*: | | |
| Board structure | One-tier (executive and nonexecutive board) | Two-tier (executive and supervisory boards) |
| Major source of finance | Equity from the capital markets | Debt from banks |
| Role of capital markets | High | Low |
| Role of banks | Low | High |
| Ownership concentration | Low/diffused | High/concentrated |
| Regulatory orientation | Self-regulation | Statutory regulation |
| Legal system/ origin | Common law/Anglo-American: UK, US/Commonwealth | Civil law/Continental Europe: France, Germany, and Japan |
| Time horizon of economic benefits | Short-term | Long-term |
| *Major solutions* | | |
| Solution | Removing restrictions on markets. Strengthening the incentive system. Introducing a voluntary code of governance. Introduction of a combination of efficient contracts | Trust and long-term contractual associations between the firm and stakeholders. Interfirm cooperation. Employee participation. Introducing business ethics |

Sources: Compiled from Keasey et al. (1997); Weimer and Pape (1999); Letza et al. (2004).

(Keasey et al. 1997). More specifically, as a rational economic model, it assumes that factor markets (capital, managerial labor, and corporate control) are efficient and subsequently, self-regulation backed by additional voluntary mechanisms, such as a voluntary corporate governance code are more effective in reducing divergent activities of managers (Letza et al. 2004).

The rejection of external interventions by central regulatory authorities, but heavy reliance on a free market regulation, is also based on a core premise that the major source of finance to corporations is equity rather than debt. That is, equity capital is expected to be raised mainly from efficiently operated capital markets. In such a market, capital is assumed to freely move to investments that offer the highest risk-adjusted returns (Friedman 1970).

Finally, and as a corollary, equity markets tend to be relatively better developed in Anglo-American countries, such as the UK and USA than in Continental European countries like Germany and France (Weimer and Pape 1999). This implies that shareholders can easily either transfer their capital from a poorly governed company to a better-governed one or a poorly governed company may be acquired by a better-governed firm through the inherent efficient markets for corporate control. Similarly, and at least in theory, poorly performing managers can easily be fired and replaced with an efficient team, hence, providing the most effective restraints on managerial discretion.

## Major Criticisms of the Shareholding Model

Despite its dominance as a major corporate form worldwide (Keasey et al. 1997), the shareholding model suffers from several weaknesses (Sternberg 2004). These weaknesses generally concern shareholder power and democracy, stakeholder interests, social morality and ethics, efficient factor markets, and excessive short-termism (Letza et al. 2004).

Firstly, it has been suggested that shareholders lack sufficient power to control management and prevent misuse of corporate resources as purported by the shareholding model. Central to this model is the axiom of shareholder primacy, which presupposes that corporations should mainly be managed for the welfare of shareholders. Arising out of such a presupposition is that theoretically a residual power rests with the shareholders so that they can choose the persons to whom operational power is delegated. It also entitles them to participate in major corporate decisions, including exercising the power of hiring or firing the board of directors, usually at an annual general meeting (AGM).

In practice, however, it has been contended that the ability of shareholders to meaningfully exercise such control over the direction of their company is severely limited by the very procedures, which govern such meetings and corporate officers elections (Sternberg 2004). For example, it is directors rather than shareholders that typically set the agenda of an AGM, and by implication directors determine the issues that come up for voting. By contrast, it has been shown that it is either difficult or impossible for shareholders to get binding resolutions of their own onto the agenda (Sternberg 1997).

Secondly, and closely associated with the lack of real shareholder power, is that directors, who are expected to be the first line of defense for shareholders, also suffer from many defects. Sternberg (2004) suggests that because executive directors of a corporation are also normally its managers, they are less willing to recognize, criticize, or correct their own mistakes. Nonexecutive directors' accountability to shareholders is also usually impaired by the ways in which they are nominated, officially appointed, and remunerated (Sternberg 1997). In an Anglo-American model, the appointment procedure is such that most nonexecutive directors are nominated by the chief executive or by the board themselves (Sternberg 2004). This makes them insufficiently independent of management and insufficiently accountable to shareholders.

It is, however, acknowledged that with the recent increase in the proliferation of codes of good corporate governance, especially among Anglo-American countries (Aguilera and

Cuervo-Cazurra 2009), the procedures for board appointments are gradually improving. The UK's 2006 Combined Code, for example, requires listed firms to establish independent nomination committees. It also requires the nomination committees to be constituted and chaired by independent nonexecutive directors. Requirements of these nature imposed by codes of good governance on firms have generally improved board accountability, independence, and monitoring of company executives and senior management.

Short-termism is a third criticism that has usually been levelled against the Anglo-American corporate governance model. Opponents (Letza et al. 2004) of the shareholding model contend that it is significantly flawed by its excessive fixation on short-term financial performance – short-term returns on investments, short-term corporate profits, short-term management performance, short-term share prices, and short-term expenditures. This arises out of the substantial reliance on and the existence of efficient capital markets, which put huge pressure on managers.

In principle, a higher short-term share return, for example, is preferred to a lower one in this corporate governance model. By contrast, a comparatively lower share price, for instance, makes a firm more vulnerable to receiving takeover bids, including hostile ones. This huge market pressure from investors and competitors leads to managerial preference for investments with shorter payback period in order to boost short-term profits, while disfavoring long-term capital investments, like research and development expenditure (Keasey et al. 1997).

Finally, and by far the most compelling attack and formidable challenge to the Anglo-American model has come from stakeholder theorists (Freeman 1984). Generally, stakeholder theorists have criticized the shareholding model on two main grounds that: (i) it ignores the social, ethical, and moral responsibilities of the corporation as an important societal institution; and (ii) it offers a narrow definition of the stakeholders of the firm (Sternberg 2004).

Firstly, stakeholder theorists (Freeman 1984) argue that rather than running the firm to primarily maximize the wealth of shareholders (Berle and Means 1932), the firm should equally serve the interests of a wider stakeholder group. These may include employees, creditors, suppliers, customers, and local communities that have long-term relationships with the firm, and thus affect its long-term success. As a result, it has been contested that the Anglo-American model's exclusive emphasis on the powers and rights of shareholders results in the negligence of the interests of other legitimate stakeholders (Sternberg 1997).

Secondly, a close criticism from stakeholding theorists is that the shareholding model lacks the capacity to give serious consideration to ethical and moral issues. A popular but sometimes controversial ethical and moral criticism is that the Anglo-American governance model encourages excessive or even "*obscene*" executive remuneration (Sternberg 2004). It is reported, for example, that the average CEO of a medium-sized American corporation earns 531 times as much in pay, bonuses, and stock options as the average factory worker. It has been argued, however, that good corporate governance is expected to empower the weaker sections of society.

In this case, the shareholding governance model is criticized for "unethically" strengthening further the already rich and powerful societal segments – shareholders and managers rather than empowering the weaker sections of society – lower level employees, local communities, the poor, women, and children. In this case, the 2007/2008 global financial markets offers classic anecdotal examples. In spite of receiving multibillion-pound British Government bailouts (Turner Review 2009), and reported record of multibillion-pound losses at some major British banks, including the Royal Bank of Scotland and Lloyds Banking Group, reports within the popular media suggest that senior executives continued to pay themselves millions of pounds of bonuses (Walker Review 2009). Arguably, this may further transfer wealth from ordinary taxpayers to already rich senior corporate bank executives.

Due to the above weaknesses, stakeholder governance theorists purport to offer a better alternative to the shareholding governance model. The next subsection, therefore, will discuss the

stakeholding corporate governance concept. For purposes of comparison, Table 1 will be referred to throughout the next subsections. Specifically, the first subsection will present theoretical assumptions and solutions, while the subsequent subsection will examine the major weaknesses of the stakeholding model.

## The Stakeholding Model of Corporate Governance

### Theoretical Assumptions, Features, and Solutions of the Stakeholding Model

To start with, and as Table 1 suggests, the stakeholding model of corporate governance is often found in France, Germany, Japan, and other European or Asian countries. A central underlying assumption of the stakeholding corporate governance model is that the purpose of the corporation is to maximize the welfare of a number of stakeholders of the firm rather than those of shareholders alone (Table 1). That is, unlike the shareholding model that encourages firms to "*exclusively*" advance the interests of shareholders, it suggests that companies should "*inclusively*" pursue the interests of a group of identifiable stakeholders who may either directly or indirectly be affected by or can affect the success of the firm.

Past stakeholder theorists have offered classical exposition of the "*inclusive*" governance concept (Jensen 2002). They suggest that a firm consists of social groups in which each group can be seen as supplying the firm with important resources (contributions) and in return expects its interests to be promoted (inducements).

For example, it is suggested that shareholders supply the firm with capital. In exchange, they expect to maximize the risk-adjusted return on their investments. Creditors provide the firm with loans. In return, they expect their loans to be repaid on time. Local communities supply the firm with location and local infrastructure. In exchange, they expect the firm to improve their quality of life. Managers and employees provide the firm with time and skills. In return, they expect to receive a sustainable income, and this has been argued to be true for every reasonably conceivable constituency of the firm (Jensen 2002).

As a result, and unlike the shareholding model, the stakeholding governance model presupposes that the governance problem arises out of the absence of broader stakeholder participation in the running of public corporations (Table 1). Like the shareholding model, however, it subscribes to the idea that the separation of ownership and control in modern public corporations creates a governance problem (Keasey et al. 1997). It also concurs with the shareholding model's assumption that the resulting agency conflicts may be reduced by the firm through a nexus of contracts between the various stakeholders of the firm, and that the firm should be run rationally in economic terms to broadly maximize its wealth (Table 1).

By contrast, it rejects the assumption that shareholders and managers are the only important participants in such a relationship (Table 1). Further, while it shares the assumption that markets can be efficient (Table 1), it also recognizes the existence of short to medium-run market inefficiencies. This implies that there may be a need for occasional external interventions, including statutory legislations to establish equilibrium in order to maximize the broader societal wealth (Weimer and Pape 1999).

In response, the stakeholding model offers several solutions. Firstly, it proposes a two-tier corporate board structure as a way of achieving a broader representation of the interests of a larger group of stakeholders of the firm (Mallin 2007). Thus, in a typical stakeholder governance framework, like in Germany, companies will normally have a dual board structure: (i) a supervisory board and (ii) a management one. The supervisory board is usually constituted by many stakeholders, including investors (shareholders and creditors/banks), employees (union groups), suppliers, customers, and government appointees representing broader segments of society. In this case, it mandates the managing board to run the company in the best interests of a number of stakeholders. This implies that the interests of shareholders should only be pursued to the extent that they are not detrimental to the interests of the other stakeholders of the firm (Mallin 2007).

Secondly, it encourages corporate management to focus on building trust and long-term contractual relationships between the firm and its stakeholders (Letza et al. 2004). In particular, it supports interfirm cooperation, including cross-shareholdings (especially in Japan) and employee participation in decision-making through the supervisory board (particularly among German firms). Similarly, it encourages closer contact between shareholders, creditors, managers, employees, and suppliers, as well as the integration of business ethics as a solution to achieving a balance among the various stakeholder interests (Table 1).

One consequence of the stakeholding model's insistence on balancing the interests of the various stakeholders is that it may render it less appealing to equity investors. As such, companies tend to rely heavily on debt rather than equity as a major source of finance (Weimer and Pape 1999). The corollary as Table 1 shows is that equity markets (stock exchanges) tend to be underdeveloped relative to the debt markets (banks) with relatively high level involvement by credit granting banks in providing capital for public corporations.

Finally, block shareholdings from the various stakeholders, such as employee unions, government, and banks, lead to a situation in which ownership is often highly concentrated. Concentrated ownership and close managerial monitoring, especially from the supervisory board, reduce agency costs. Concentrated ownership may also be associated with weak investor protection, particularly minority investors, which could normally be explained by the legal system of countries often associated with the stakeholder governance framework.

Specifically, La Porta et al. (1998) demonstrate that there is a negative relationship between ownership concentration and investor protection, which can be explained by legal origin. They show that Anglo-American countries (common law family, like the UK and USA) have dispersed ownership with higher investor protection in comparison with Continental-European-Asian (civil and Scandinavian law origin, such as France, Germany, and Japan) countries, which tend to have relatively high ownership concentration with weaker investor protection.

### Major Criticisms of the Stakeholding Model

The stakeholding governance model has also received several criticisms. These include its incompatibility with the concepts of business, governance, and private property rights (Letza et al. 2004).

Firstly, a central criticism of the stakeholder governance model is that it is not compatible with the concept of business (Letza et al. 2004). It proposes that corporations must strive to achieve a fair balance in distributing the benefits of the firm to a number of stakeholders, and as such prevents the firm from pursuing a single objective function that favors particular groups (Sternberg 1997). This is, however, not consistent with the notion of business, which involves the investment of one's capital in a commercial firm to primarily maximize its long-term value (Letza et al. 2004). Jensen (2002) suggests that if a business is prevented from operating efficiently by focusing on maximizing owners' profits (purposeful behavior), it will simply collapse in the long-run. This will negatively affect social value and welfare of all stakeholders.

Secondly, the definition of stakeholders appears to be vague sometimes. Since stakeholders are all those who can affect or are affected by the business, the number of people whose benefits need to be taken into account is simply infinite (Sternberg 2004). This means that stakeholders by definition could be anybody or anything from anywhere or everywhere, and as such could range from employees, creditors, government to terrorists, corporate armed-robbers, and the sea, among others. Yet, it mandates that a balance be struck in the distribution of benefits to all stakeholders, but ambiguous stakeholder definition means that balancing divergent stakeholder interests is also an unworkable objective (Jensen 2002).

Thirdly, the stakeholding governance model is incompatible with the notion of corporate governance. A key corporate governance concept is accountability: the accountability of directors to shareholders; the accountability of managers to directors; and the accountability of corporate employees and other corporate agents to shareholders through managers and directors

(Sternberg 1997). Stakeholding, however, suggests that firms should be accountable to all their stakeholders rather than to their shareholders alone (Letza et al. 2004). By contrast, it has been argued that multiple accountability works if the purpose is unambiguous to everyone involved (Sternberg 2004). In fact, the 2002 King Report of South Africa suggests that an organization that is accountable to everyone is actually accountable to no one. Thus, accountability that is diffuse is effectively nonexistent and unworkable in governance terms.

Finally, an associated criticism is that the stakeholder model provides no effective objective standard against which corporate agents can be judged (Sternberg 2004). Corporate agents are mandated to run the business primarily to balance all stakeholders' interests. It is, however, contested that it does not serve as an effective objective performance measure because it allows corporate agents responsible for its interpretation and implementation, excessive freedom to pursue their own narrow interests, including perquisites consumption and other private benefits of control (Sternberg 1997).

## Conclusion: Future Perspectives

This entry has attempted to define corporate governance. The central rationale has been to paint the broader corporate governance picture within which the international corporate governance reforms, codes, policies, research, and context could easily be understood by corporate governance academics, especially research students and early career academics, policy-makers, and regulatory bodies.

In this regard, the entry began by offering a working definition of corporate governance. While it acknowledged that corporate governance has no universally accepted definition, it suggested that the existing numerous definitions can be classified into two groups: narrow and broad. At the narrow level, it defined corporate governance as referring to internal governance structures, such as the executive management, the board of directors, and the general assembly of shareholders, by which companies are directed and controlled. At the most expansive form, however, it contended that corporate governance goes beyond immediate internal governance mechanisms to include external structures and stakeholders, such as the legal system, the efficient factor markets, local communities, the regulatory system, as well as the political, cultural, and economic institutions within which companies operate.

Overall, the entry identified two major types of corporate governance within the international literature and context: the "*shareholding*" and "*stakeholding*" models. In simple terms, it suggested that the shareholding model refers to the narrow definition of corporate governance, in which the interests of shareholders are considered as paramount, and is usually found in Anglo-American countries, such as the UK and USA. In contrast, the stakeholding model refers to the broader definition of corporate governance, which attempts to equally cater for the interests of a number of stakeholders of the firm, and is normally predominant in Continental European and Asian countries, like Germany and Japan. It also acknowledged, however, that the shareholding and stakeholding dichotomization of modern corporate governance systems might be an oversimplification. This is because due to increased globalization, greater global stock market integration through cross-listing, and the proliferation of national and trans-national codes of corporate governance, among others, corporate governance practices are increasingly converging across different countries and systems. Further, for each corporate governance model, the underlying theoretical assumptions, major features, and proposed solutions as found within the international corporate governance literature were discussed. Of crucial relevance is that the extant literature shows that both models suffer from several weaknesses. This raises an important public policy question as to whether it will be more valuable to formally combine some of the main features of the "*shareholding*" and "*stakeholding*" models to form a "*hybrid*" corporate governance model that will be capable of addressing their current respective weaknesses.

# Definition of Nonprofit Organization

Gianluca Antonucci
DEA – "G. d'Annunzio" University, Chieti-Pescara, Italy

## Synonyms

Charities; Civil society organizations; Non-governmental organizations (NGOs); Nonprofit institutions; Philanthropic organizations; Social economy organizations; Third sector organizations; Voluntary organizations

## Definition

Despite different naming framed along the years and in different countries according to different traditions, a distinctive feature of every nonprofit organization is the prohibition, or limit, as in the case of some specific organizations like social cooperatives and social enterprises in Europe, from distributing their assets or surpluses regardless of the presence or absence of tax breaks. A nonprofit organization finds its essence in having the mission of producing and delivering public goods together with advocacy actions, having as inspiring mission, a social objective rather than the search for profits. A nonprofit organization belongs to an institutional sector between state and market.

## Introduction

Private organizations having the mission of delivering public goods produced neither by the market nor by the public system, which fulfill both economic and social missions and pursue a general interest, and whose final objective is not the redistribution of profit, have always existed. In the last few decades they have, however, increasingly become the object of specific attention, due to

the increase in both their number and different fields of intervention.

Since the early 2000s, at an institutional level, the necessity has been recognized of considering these "new" organizations within a different specific institutional sector from those of the public and the private market. This has triggered the search for a generally accepted definition for these organizations. The point is that, considering the different traditions developed in Europe and North America, as well as the development, since the second half of the twentieth century, of such organizations also in developing countries, there is not yet a unique univocal definition.

Some basic features have been distinguished and their fields of activity have also been clearly defined as the 12 described by the International Classification of Nonprofit Organizations (Salamon and Anheier 1997). However, it is not easy to have a "simple common label" agreed upon at an international level, due to the fact that over the years this bewildering array of entities, such as hospitals, day care centers, universities, social clubs, sports clubs, grassroots development organizations, environmental groups, self-help groups, religious congregations, job training centers, human rights organizations, community associations, have been variously known as belonging to the "nonprofit," the "voluntary," the "civil society," the "third," the "social economy," the "NGO," or the "charitable" sector. All these different terms are derived from different traditions in different countries and underline specific aspects. After the alignment of the principal aspects regarding definitions both at institutional and academic level, this entry reviews all the different common appellations reading them according to cultural traditions and general contexts.

## Institutional Classifications of Nonprofit Organizations

This section first describes the most widely recognized nonprofit classification systems and then summarizes their main differences and common points of agreement.

A starting point in searching for a clear definition nonprofit organizations (NPOs) is the analysis of the different "formal" classifications given by institutional organizations in defining a classification system for the different NPOs. Thus this first section of the entry presents an overview of the main classifications given by United Nations and the Organization for Economic Co-operation and Development, together with the presentation of the first important empirical study upon NPOs, conducted internationally, initially under the guide of Salamon and Anheier, by the Johns Hopkins University. At the end of this section some shared points of the different described definitions are derived.

In 2003, United Nations (UN) published the *Handbook on Non-Profit Institutions* (NPIs) in the System of National Accounts in order to account for the growing economic contribution of NPOs worldwide (UNO 2003). The manual aimed to improve and make available data on an increasingly important sector, as figures were not developed yet as part of the economy-wide compilation of data on national accounts. The handbook provided a first "formal" definition of NPOs, that instead of describing their specificities that led to the necessity of considering them within a specific institutional sector (IS), defined what differentiated these organizations from the ones already recognized, belonging to the already structured IS. In the handbook, the organizations belonging to this "new" IS were different from the ones belonging to the already recognized ones for the following reasons:

- *Corporations* differed from NPOs because were set up for purposes of engaging in market production and were capable of generating a profit or other financial gain for their owners.
- *Government units* differed from NPOs because were unique kinds of legal entities established by political processes with legislative, judicial, or executive authority over other institutional units within a given area including the authority to raise funds by collecting taxes or compulsory transfers from other institutional units.

- *A household* differed from an NPO because it represented a small group of persons who shared the same living accommodations, who pooled some or all of their income and wealth, and who consumed certain types of goods and services collectively, mainly housing and food (UNO 2003).

After drawing these distinctions, the handbook identified the following characteristics as being common features among NPOs:

- The prohibition on the distribution of profits giving them an objective function quite different from that of for-profit corporations
- Their involvement in the production of public goods
- A revenue structure that generally includes substantial voluntary contributions of time and money
- The use of volunteer as well as paid staff
- Limited access to equity capital
- Eligibility for special tax advantages in many countries
- Special legal provisions pertaining to governance, reporting requirements, political participation, and related matters
- The lack of sovereign governmental powers despite their involvement in public goods provision (UNO 2003)

Also the Organization for Economic Co-operation and Development (OECD) reflected on the importance to analyze NPOs within an IS different from the state, the market, and the household. In 2003 recognizing that the nonprofit sector was often associated with concepts such as "social economy," "third sector," and "third system" underlined that it was a growing social and economic force all over the world and a key element in employment and social policies in most OECD countries. All of these terms broadly characterized the existence of a distinct sector that lied between state and market, whose organizations aimed to pursue a public interest, rather than a profit. Given the different traditions and the different origins, each of the terms considered by OECD tends to underscore a specific aspect of the sector. For example, the term nonprofit sector, originating in the United States, denotes the prohibition on the redistribution of profits, while the term "*économie sociale*" or "social economy," widely used in France, emphasizes the socioeconomic dimension of the sector and the term "third sector" highlights the position of this IS between the state and the market (OECD 2003). Moreover, OECD underlined that despite the different naming according to different traditions, the sector organizations lying in a space between the state and the market has existed for many years in several OECD member countries but emerged worldwide in the second half of the twentieth century, mainly as a response to the crisis of welfare systems and to the perceived need to reshape them, notably in the European context and as a new strategy against social and economic exclusion (OECD 2003). The response to the crisis of the welfare state leads indeed to the development of NPOs in diverse areas of the economy, such as health and care, culture, environment, social services, education and employment through various entities such as associations, traditional cooperatives, social cooperatives, charities, foundations, or other types of organizations. Nevertheless, the different legal statuses for the different kinds of entities belonging to an IS different from state and market, OECD recognized that there was no yet a general theory which could explain the limits and competitive advantages of the sector as a whole because in comparison to market or public policy analysis, nonprofit studies were a relatively "young" but rapidly evolving field of research (OECD 2003).

In 2004, OECD, in confirming the difficulties in finding a general theory, underlined that the definition of this sector between the state and the market was not an easy to find because it may, for example, be equated with the idea of the "social economy," seen by the European Union as comprising cooperatives, mutuals, associations, and foundations, ignoring the many examples of not-for-profits or social enterprises that do not fall into easily defined categories. Thus all these organizations, according to OECD, could be encompassed in a space which includes a range of more recognized terms such as not-for-profits, voluntary sector, mutuals, social enterprises, or community

enterprises. The common factor is that they all have a focus on social or environmental objectives rather than profit seeking categories. However, some do create a profit but reinvest this in their activities or distribute to relevant stakeholders rather than external shareholders or the owner manager. That is why according to OECD this "new" sector between the state and the market can range from organizations that are fully grant dependent to those that are fully self-financing and from those that compete in mainstream markets to those that provide nonmarketable goods and services. The range of social and environmental goals is extremely diverse as are their governance structures and the different groups of stakeholders who are engaged with each organization (Westall 2004).

In agreement with the UN, the OECD confirmed the necessity for a better classification of NPOs' activities and impact within National Accounts designing specific accounts for them otherwise their inclusion in the already existing accounts could lead to underestimations and distortions such as:

- "To add non-profit value in other sectors, usually government, overestimating the relevance of the public sector.
- Consider the assets held by non-profit organizations, such as foundations, as part of the personal savings having distortions on the consideration of household savings.
- Ignore the role of volunteers and unpaid.
- Include in the governmental accounts also the international transfers and activities by those specific NPOs organizations like the non-governmental organizations" (OECD 2003).

Considering the necessity for a better understanding of the role and the impact of the whole range of NPOs (such need was related to NPOs particular aspects that led to their inclusion in a dedicated IS), the Johns Hopkins University launched, at the beginning of the 1990s, under the guide of Salamon and Anheier, the Comparative Nonprofit Sector Project (CNSP) that led then to the creation of the Center for Civil Society Studies, whose specificities will be addressed later in this entry. The project was born with the aim to document the scope, structure, financing, and role of NPOs for the first time in solid empirical terms in a significant number of countries representing different geographic regions, cultural and historical traditions, and of development (Salamon and Anheier 1998).

Along the years, the number of countries participating into the project increased, exceeding 40 countries, thus providing a remarkable empirical analysis able:

- To explain why this sector varies in size, composition, character, and role from place to place and identify the factors that seem to encourage or retard its development, including differences in history, legal arrangements, religious background, cultures, socioeconomic structures, and patterns of government policy to evaluate the impact these organizations are having and the contributions they make, as well as the drawbacks they entail
- To improve awareness of this set of institutions by disseminating the results of the work
- To build local capacity to carry on the work in the future (Salamon and Sokolowski 2010)

The development of such worldwide empirical project was grounded on the consideration that recent years had witnessed a considerable surge of interest throughout the world towards these organizations that occupy the social space between the market and the state, variously known as the "nonprofit," the "voluntary," the "civil society," the "third," the "social economy," the "NGO," or the "charitable" sector. This set of institutions included a bewildering array of entities such as hospitals, universities, social clubs, professional organizations, day care centers, grassroots development organizations, health clinics, environmental groups, family counseling agencies, self-help groups, religious congregations, sports clubs, job training centers, human rights organizations, community associations, soup kitchens, homeless shelters, and many more. Although the existence of such institutions was by no means a new phenomenon, the number and variety of such organizations seemed to have

grown enormously in the last decades of the twentieth century (Salamon and Sokolowski 2010).

Despite the wide range of different entities composing this sector, over the years, CNSP's analysis has been able to find a consensus on five structural or operational features that defined the entities. Those were provided to define the characteristics of NPOs:

- *Organizations*, i.e., they have some structure and regularity to their operations, whether or not they are formally constituted or legally registered. What is important is not whether the group is legally or formally recognized but that it has some organizational permanence and regularity as reflected in regular meetings, a membership, and/or some structure or procedures for taking decisions that participants recognize as legitimate.
- *Private*, i.e., they are not part of the apparatus of the state, even though they may receive support from governmental sources.
- *Not profit distributing*, i.e., they are not primarily commercial in purpose and do not distribute profits to a set of directors, stockholders, or managers. NPOs can generate profits in the course of their operations, but any such profits must be plowed back into the objectives of the organization.
- *Self-governing*, i.e., they have their own mechanisms for internal governance, are able to cease operations on their own authority, and are fundamentally in control of their own affairs.
- *Voluntary*, i.e., membership or participation in them is not legally required or otherwise compulsory (Salamon and Sokolowski 2010).

The project's studies led to the definition of the International Classification of Nonprofit Organizations (ICNPO), which comprises the following 12 fields of activity: (1) culture and recreation; (2) education and research; (3) health; (4) social services; (5) environment; (6) development and housing; (7) civic and advocacy; (8) philanthropic intermediaries; (9) international; (10) religious congregations; (11) business and professional, unions; (12) other.

Even if run by different organizations for different purposes, the analysis of the above reported researches and classifications allows enucleating some common aspects, which are useful for a general classification of NPOs. In particular, they all share the following propositions:

- NPOs have always existed, but the early 2000s witnessed a considerable surge of interest throughout the world around them, as their great increase – both in number and fields of interventions – indicated all around the world.
- The ensemble of NPOs consists of private organizations, formally or informally constituted, that do not fall in other ISs due to the fact that, firstly, they are not primarily commercial in purpose and do not distribute profits, and then, having their own specific governance characteristics, they have in common a focus on social or environmental objectives, rather than profit-seeking categories.
- It is not easy to establish a clear univocal definition encompassing the different realities in the various countries because of the different historical traditions that consider them as variously belonging to the "nonprofit," the "voluntary," the "civil society," the "third," the "social economy," the "NGO," or the "charitable" sector.
- They are mainly engaged in the production of public goods in different fields ranging from health, education, social services to environmental protection, civic affairs, and advocacy.

## Principal Features of Nonprofit Organizations Classification Systems

Following NPOs diffusion both in number and in fields of activity, several researchers started to look in depth at their essence. The first important study to be mentioned is the above reported analysis within the CNSP that led to the definition of the ICNPO, specifically designed to differentiate entities through the five basic above reported features identified by the study to make up the "nonprofit sector." This section briefly reports other

important academic findings which, along with ICNPO, can be considered as main pillars for the definition of NPOs. In particular, Burton A. Weisbrod, whose definition on the existence of NPOs is based on the concepts of market failure and government failure; Henry B. Hansmann whose definition is based on the notion of contract failure; and the European research network EMES, whose definition of NPOs is based on the attention given to an historical-dynamic perspective.

According to Weisbrod, NPOs should be considered as components of a specific sector. Nevertheless, they are far from homogeneous, because there are as many variations among them as there are among governmental organizations and for-profit firms (Weisbrod 1988), but they all share three characteristics that make them different from organizations belonging to the other two sectors: (1) no one owns the right to share in any profit or surplus of a NPO; (2) NPOs are exempt from taxes on corporate income; (3) some NPOs receive subsidies and/or donations (Weisbrod 1988). Weisbrod recognizes that NPOs have always existed. He identifies their essence in their ability to respond both to private for-profit and public sectors' limitations to meet various human needs. The private market does not respond to any wants or needs unless they are accompanied by money demand. This is because consumers who are willing and able to pay will have their demands satisfied through the private market; those who are not, will not. The consequence is that consumers who are poorly informed will not find the private market supplying higher quality when lower quality can be sold at the same price. Collective action, through government, has the potential of correcting market failures. Since it has the power to tax, government can finance, subsidize, mandate, or otherwise encourage the provision of goods and services that are inadequately provided by the private sector or that are not provided to particular groups in the population (Weisbrod 1988). However, governments provisions have limits too because governments satisfy the demand of the median voter, that is the majority of the citizens that "assure" the stability of the government and maximize the chances of reelection. Therefore governments provide a level of public goods lower than what desired by citizens, with a level of demand greater than the median voter's one. NPOs existence is given by their capacity to respond to the unsatisfied demand that remains after the government intervention. In this regard, the greater the heterogeneity of the demand, the greater is the space of intervention for NPOs, as the undersatisfied demand for collective-type goods can be considered a governmental "failure" analogous to private market failures. This means that if government responds to the demands of the majority and the nonprofit sector responds to the demands of the undersatisfied, the greater the diversity of the demand, the larger the size of the nonprofit sector will be (Weisbrod 1988). Indeed nonprofit organizations may develop for a number of reasons. Some are created for mutual benefit, and some for charitable purposes; moreover, governments may choose to use nonprofit organizations to provide certain services that are difficult or expensive to monitor (Weisbrod 1988).

According to Hansmann "true" nonprofits are firms that are formally organized as either nonprofit corporations or charitable trusts. They are all characterized by the fact that they are subject, by the laws of the state in which they were formed, to the "nondistribution constraint" that prohibits the distribution of residual earnings to individuals who exercise control over the firm because net earnings, if any, must be retained and devoted, in their entirety, to finance further production of the services that the organization was formed to provide (Hansmann 1980).

The flexibility of the statutes, as well as the specific governance rules, permits NPOs to assume a wide variety of forms. Thus, Hansmann develops a basic subcategorization of NPOs by their source of income and the way in which they are controlled (Hansmann 1987). According to the source of income he identifies: *Donative* NPOs, which receive most or all of their income in the form of grants or donations; *Commercial* NPOs, which receive the bulk of their income from prices charged for their services. According to the way in which they are controlled he identifies: *Mutual* NPOs, which are controlled by their

patrons; *Entrepreneurial* NPOs, which are largely free from the exercise of formal control by their patrons (Hansmann 1987). He makes some examples of different types of organizations and mix of financing and controlling rules shaping a two-dimensional array. For example, Organizations for a Common Cause, National Audubon Society, and Political Clubs are examples of mutual donative organizations. American Automobile Association, Consumers Union, and Country Clubs are examples of mutual commercial organizations. March of Dimes and Art Museums are examples of entrepreneurial donative organizations. National Geographic Society, Hospitals, and Nursing homes are examples of entrepreneurial commercial organizations (Hansmann 1987).

Commercial NPOs, whatever their legal form, arise where, because of the different circumstances in which a service is purchased or consumed, or because of the particular nature of the service itself, consumers feel unable to evaluate accurately the quantity and/or quality of the provided service. Therefore, a for-profit organization could exploit the information asymmetry condition for obtaining higher profits providing quantity and/or quality lower than what was promised or paid for by the consumers. Indeed consumers recognize more confidence to an NPO because, being it under the nondistribution constraint, its owners and administrators cannot obtain any personal gain from the realization of extra profits resulting from the exploitation of information asymmetries, and are not encouraged to take any advantage (Hansmann 1987). In synthesis, commercial NPOs arise where ordinary contractual mechanisms do not provide consumers with adequate means to police producers. In the case of donative NPOs a donor is considered as a purchaser of services, differing from the customers of commercial nonprofits only in that the services he or she is purchasing are either (1) delivery of goods to a third party, as in the case of charities for the relief of the poor or distressed, or (2) collective consumption goods produced in such aggregate magnitude that the increment purchased by a single individual cannot be easily discerned. In either case, the purchaser is in a poor position to determine whether the seller has actually performed the services provided; hence, the purchaser has an incentive to patronize a nonprofit firm (Hansmann 1987).

Thus Hansmann – in a certain sense enriching Weisbrod's theories which answered to questions about the role of NPOs, that is: "why do NPOs exist?" – termed his theory the contract failure theory of the role of NPOs (Hansmann 1987) answering to the questions about the behavior of NPOs, that is "what objectives are pursued by NPOs?"; "how do NPOs differ from for-profit organizations?"

On the European side, an important input in the definition and study of NPOs was given by EMES, a research network of established university research centers and individual researchers whose goal, since its birth in 1996 – when an international group of scholars formed a research network initially financed also by the European Union – is to gradually build up an international corpus of theoretical and empirical knowledge, pluralistic in disciplines and methodologies, around social economy, as will be described in the last section of this entry, solidarity economy and social innovation.

In building up their corpus of knowledge, recognizing the works of researchers from the US EMES researchers framed what they called European approach. The distinctive feature of this approach is the attention given to the historical-dynamic perspective in studying NPOs thus taking a more analytical perspective, focusing more on generating NPOs typologies that highlight different modes of action and the changes in them over time (Laville et al. 1999). Therefore, EMES' researchers gave a broader definition of those entities between the state and the market which include – in the "Third Sector," originally shaped as "Third System," as they defined it – also cooperatives and mutual aid societies. Indeed, according to EMES' researchers, these organizations (especially in Europe) are created not for maximizing return on investment, rather for meeting a general or mutual interest, contributing to the common good, or meeting social demands expressed by certain segments of the population. The basic features of the European definition by EMES are: (1) the

inclusion of an analytical approach developing organization typologies and changes with an emphasis on the development of their economic dimension; (2) the criterion of limits on private acquisition of profits (inclusion of cooperatives and mutual aid societies) (Laville et al. 1999).

According to EMES' researchers the Third Sector in Europe is associated with the expansion of public intervention because it is the source of a number of action models that generated public services. In addition, it has established a relationship with the market. The final outcome is a concept that emphasizes the intermediary dimension of phenomena referred to collectively as the Third Sector. Another distinguishing feature of European research is the emphasis placed on the fundamentally open, mixed, pluralistic, and intermediary nature of the Third Sector and a concomitant rejection of the notion of sectors so as to avoid creating the impression that there is a clear line of demarcation between, on the one hand, the marketplace, the political arena, and the community, and, on the other, the Third Sector. This pluralist vision leads to a Third Sector embedded in the framework of a three-polar system rather than understanding the Third System as juxtaposed to states and markets (Laville et al. 1999).

## Different Types of Nonprofit Organizations

Both at institutional and academic level, it has been recognized that NPOs have always existed, but since the beginning of the 1990s there has been a considerable surge of interest towards these institutions – which occupy the social space between the market and the state – due to the fact that they are on a constant increase all over the world and nowadays represent a key element in employment and social policies. At the same time it has also been underlined that these institutions have been variously known – according to the different traditions developed, over the years – as belonging to an ensemble of entities known as: the "nonprofit," the "voluntary," the "civil society," the "third," the "social economy," the "NGO," the "charitable" sector, etc. The different designations used for defining these organizations can be clarified looking at their origins and inner essence (Antonucci 2011). This section of the text reports on the different meanings and characteristics of the different appellations along the time.

### Charities (Religious Organizations)

Within the UK system, charities are voluntary bodies whose purpose is predominantly to benefit the community, not private individuals. Any private benefit must be incidental. There are thus three defining characteristics of charities: public benefit, independent governance, nonprofit distribution. A possible first legal framework can be found in the Act of Parliament of 1601 which reaffirmed the charitable framework in order to tackle postmedieval social and economic difficulties by harnessing the commitment of the public spirit (Fries 1999).

Nevertheless, charities are not specifically British organizations. The point is that the same analysis, as the one reported above referring to the UK can be made (obviously with different dates and Parliamentary Acts) for nearly all European countries, due to the fact that the definition of charity has ancient roots. It has always existed in Europe since the Middle Ages and, during the Modern Age, has been legally framed, up to the present time. Indeed, nearly all European countries have charities named for example *Instituciònes de Caridad* in Spain, *Associations Caritatives* in France, and *Istituti Caritatevoli* in Italy. They all have the same purpose and origin, and share, even in their names, the same root, which etymologically comes from the same Latin word *caritas*, meaning "unselfish love for God," and indicated all those entities, in the Middle Ages of a religious nature whose aim was to do charity work, that is to collect offerings for initiatives and actions to help the poor and homeless. Indeed, during the Middle Ages, the act of giving was seen not simply as an act towards the less fortunate, but rather as an act that earned, through the action of giving, "credits" from God for the afterlife (Landi 2014). In this sense, the institutions with religious roots that were created to help less fortunate people receiving free offerings can be seen as the "origin" of NPOs.

### Philanthropic Organizations (Foundations)

The term philanthropy, in the modern sense, was coined in England in the late eighteenth century, and is the son of the Enlightenment. It came from the search to use reason to solve problems and social needs, seeing in philanthropy a secular response to charitable movements led by religious sentiments (Gross 2003). In other words, a philanthropic organization has the same aims and purposes as a charitable one, but without having any religious aspect.

As in the above definition of charities, the same argument applies to philanthropy, whose etymology can be found in the Latin word *philantropus*, which in its turn derives from the ancient Greek words: *phileo*, which means love, and *anthropos*, meaning man. In synthesis, philanthropy means "unselfish love for man," being in this sense a word referring to a man that help men, without an ulterior sentiment towards God.

Thus, after the Enlightenment, from the end of the eighteenth century, philanthropic organizations spread both throughout Europe and North America. Once again the same origin can be found for words having the same meaning in different countries. In this case, there are no common definitions for the word philanthropy, but there are common definitions for the word philanthropist like *filántropo* in Spanish, *philantrope* in French, and *filantropo* in Italian.

The growth of philanthropy led to the creation of organizations that could work efficiently without the direct action of the philanthropist and thus also "survive" after his/her death, that is big, efficient organizations that could be autonomous from the philanthropist, equal in all respects to charities, but without any link with religion aspects, being rather a kind of "celebrative" organization of the action of the philanthropist. Therefore, over the years, there has been the creation of "foundations," seen precisely as institutions financed by a donation or legacy, given by the philanthropist, to aid less fortunate people or other important aspects of society, such as research, education, and the arts. Once again, since the nineteenth century, the "same" type of organizations has spread all over Europe and North America like *Fundaciónes* in Spain, *Fondations* in France, and *Fondazioni* in Italy.

### Voluntary Organizations (Associations, Mutuals, Unions)

By voluntary organizations the British usually mean those charities that form a distinctive part of the sector, defined by their public purpose as bodies serving the community, not just for private or personal ends. The Industrial Revolution prompted a new upsurge of not-for-profit activities in many new forms, included within the developing tradition of voluntary activity. Their essence lies in the context of the common law according to which citizens have a right to form associations without needing state authority. Voluntary bodies therefore need no permission to exist and, in fact, require no specific legal form (Fries 1999).

Again it is possible to extend the above reported considerations to all European and North American countries. The birth of voluntary organizations can be traced back to soon after the Industrial Revolution, when the main changes that were occurring into society forced the rising industrial labor force towards a new consciousness that led people to find new ways for mutual help. This assertion is supported by the fact that this period saw the birth of entities such as unions and mutuals. The term "voluntary" derives from the Latin term *voluntarius* which underlines "an action performed by interior impulse having full knowledge of the facts." In this sense the birth of voluntary organizations can be seen as a further change in the history of NPOs, with the birth of organizations of men who were looking for help/aid not through religious organizations or a philanthropist, but by mutual help. In this way there was the birth of a "new" giving, which was no longer a donation of money or goods, but rather a devotion of time, i.e., spontaneous work given to help someone else while expecting nothing in return, just doing it because it felt right to do so. As occurred for the philanthropists who created the foundations, people created by themselves, together with the mutuals and unions, the basic and simplest element of NPOs, that is the association, which needs no legal permission to exist. Indeed, the origin of the word association

can be found in the Latin term *associare* meaning "bring together, be together." Once again the common basic elements of voluntary associations in Europe and North America can be seen in that, after the Industrial Revolutions – which occurred in different periods in different countries – there was the birth, together with unions and mutuals, of similar bodies that also have in common, corroborating the abovementioned observations, also the same etymology. For example, *Asociaciones de Voluntariado* in Spain, *Associations de Volontariat* in France, *Associazioni di Volontariato* in Italy.

### Social Economy Organizations

Social Economy is a specific locution derived from the French term *Économie Social*. The origin can be traced back to by the French liberal economist Dunoyer, who, in 1830, wrote two volumes on the *Économie Social* entitled New Dissertation upon Social Economy (*Nouveau traité d'économie sociale, ou Simple exposition des causes sous l'influence desquelles les hommes parviennent à user de leurs forces avec le plus de liberté, c'est.-à-dire avec le plus de facilité et de puissance*). In considering the concept of Social Economy, the same assumptions can be made as mentioned above for the birth of philanthropy after the Enlightenment, also considering the fact that France was its birthplace. Given its French origin, the social economy model grew mainly in French-speaking countries during the end of the nineteenth and early twentieth centuries. The 1980s saw a new impulse in France, with the modification of the French Act on Non-Profit Institutions and then, in 2004, with the creation of the Regional Chamber of Commerce for Social Economy (*Chambre Régionale de l'Économie Sociale et Solidaire*). This new input led to a reframing of the concept, also at an academic level, in other European countries and Canada.

The redefinition of Social Economy describes it as an area consisting of: cooperatives, mutuals, associations, and foundations engaged in the production of goods and services, with no purpose of the owners' enrichment, but instead having objectives of sharing and solidarity, being engaged in activities such as local development, reemployment, and the fight against exclusion. The definition Social Economy indicates the various entities that are part of it, underlining their own codes of conduct and their governance, which are far from the business sector ones (Baulard 2008).

The definition of Social Economy would have remained a niche of French-speaking countries if it had not been for the fact that, since the end of the 1980s, it has been (thanks to the French inputs) the basic definition within the European Union (EU) for classifying, the organizations that occupy the space between the market and the state. The EU arrived in 2000 at the creation, within the European Commission, of the *Conférence Européenne Permanente des Coopératives, Mutualités, Associations et Fondations* (which later became Social Economy Europe), thus making the concept of Social Economy the first attempt, at international level, of framing within a specific sector all the different realities working in the space between the state and the market.

### Nongovernmental Organizations (NGOs)

Article 71 of the United Nations Charter signed in 1945 states "the Economic and Social Council may make suitable arrangements for consultation with nongovernmental organizations which are concerned with matters within its competence." This statement represents – although some preliminary locutions can also be found in previous documents of the early 1940s (Olivo 2007) – the first recognition of nongovernmental organizations widely referred to simply as NGOs.

According to the World Bank Operational Directive 14.70, "NGOs include a wide variety of groups and institutions that are entirely or largely independent of government, and characterized primarily by humanitarian or cooperative, rather than commercial, objectives. (. . .) Although organizations such as universities or research institutes may be nongovernmental, this directive refers principally to private organizations that pursue activities to relieve suffering, promote the interests of the poor, protect the environment, provide basic social services, or undertake community development" (World Bank 1989).

Irrespective of the chosen legal form, the distinctive feature of an NGO is the complete detachment from the government – actually not from "any" government but, at least, from the government of the places in which they run their activities – together with the field of activity focused on basic services and community development or advocacy like in the case of environment protection, human rights, etc. A specific and distinctive feature can be seen in the fact that NGOs – when they are not international ones engaged in advocacy – mainly operate in developing countries and have, in many cases, a registered office in a European or North American country. Considering also the period in which the first formal definitions appeared, at the time of the end of colonialism, they are the organizations that initially represented the voluntary action of people linked with a developing country but detached from its government. This might also explain why all the abovementioned definitions were made before the twentieth century in European and North American countries while NGO is a "modern" definition commonly used in all developing countries, which is why the World Bank is interested in collaborating with them, arriving in some cases to be used to define the whole sector of those organizations that occupy the social space between the market and the state.

### Nonprofit Organizations

The definition "Nonprofit Organizations" is recent and can be dated between the end of the 1980s and the early 1990s in the United States. Its derives from the fact that, while the interest in the broad range of institutions occupying the social space between the market and the state was increasing, there was also a growing need to name all the different relevant organizations, ranging from foundations to voluntary associations, as well as charities, NGOs, etc. In synthesis, it was necessary to find a label for all these different bodies, also considering the fact that, as shown in the first section of the text, the borders of a new institutional sector needed to be defined. The common point found was that all these institutions shared the main characteristic of having a no-profit purpose and were thus increasingly becoming known as "nonprofit organizations," The Johns Hopkins University Comparative Nonprofit Sector Project then led to the definitions described in the first section. Therefore, while in Europe the concept of Social Economy was rediscovered, in North America the whole category was named "Nonprofit Sector" and a nonprofit organization was identified as having the characteristics initially described by Salamon and Anheier. An aspect that corroborates this is that Weisbrod, in his initial publications in the 1970s regarding the essence of NPOs, entitled his works "Theory of the Voluntary Nonprofit Sector" while his comprehensive publication in 1988 was entitled "The Nonprofit Economy," recognizing that "Nonprofit" was the correct label to identify all the different organizations.

### Civil Society Organizations

"Civil Society Organization" is a very recent definition that can doubtless be attributed to Salamon and Anheier and their work entitled "The Civil Society Sector" (Salamon and Anheier 1997). According to the authors, the civil society sector is composed by the plethora of private, nonprofit, and nongovernmental organizations which have emerged in the second half of the twentieth century in virtually every corner of the world to provide vehicles through citizens can exercise individual initiative in the private pursuit of public purposes. Organized private voluntary activity, the proliferation of civil society organizations, that may turn out despite earlier origins represent the greatest social innovation of the twentieth century (Salamon and Anheier 1997) In synthesis, at the end of the 1990s, Salamon and Anheier – who originally gave full recognition to the definition "Nonprofit Organization" – coined a new definition, useful to indicate the new institutional sector, which was still not well highlighted in the national accounting systems of different countries, recognizing that although these entities had always existed, they required a different, specific framework and labeling because, during the twentieth century, a large number of them had sprung up all over the world, bringing them to be one of the biggest "innovators" in the social field.

In a certain sense it can be said that, after having spent nearly 10 years studying NPOs around the world in the context of the Comparative Nonprofit Sector Project, the two authors found that the "simple" characteristic of being nonprofit seeking was not sufficient to explain the whole "new" set of institutions, in all its diversity of interested groups engaged in creating the networks of civic engagement that produce and enforce communal values and notions of trust so necessary for cooperation and civil life (Salamon and Anheier 1997).

### Third Sector Organizations

The above descriptions for nonprofit organizations and civil society organizations relative to the necessity to determine a label defining a new institutional sector can also be made for the definition "Third Sector Organization," seen as an organization belonging to an institutional sector that occupies the social space between the market and the state.

The difference is that, unlike the other two above described definitions, it is impossible to identify a clear origin for this one. However, an advantage in the use of this definition is that it exists in both North America and Europe. It seems that, like the invention of the wheel, the simplest definition of an organization belonging to a "third" sector has been made in different ways in different situations. In fact, it is the "simplest" one given by the "invention" of a *tertium non datur*, i.e., since these organizations belong to a different sector from the other two, the simplest definition was to call it "third."

## Conclusion

According to definitions given in this entry considering definitions both by international institutional organizations and by academic researchers, NPOs belong to a specific institutional sector situated between the state and the market. They (1) cannot distribute any profit; (2) are involved in the production of public goods with the aim of answering market failures not solved by the public system (government failures); (3) in many cases are eligible for special tax advantages; (4) are private self-governing organizations with specific governance rules; (5) in many cases can have voluntary workers.

Moreover, it is not compulsory for them to have a legal recognition (e.g., voluntary associations), but they may have specific legal forms (e.g., foundations). They can be engaged in one or more of the following fields of activity as defined by the ICNPO: (1) culture and recreation; (2) education and research; (3) health; (4) social services; (5) environment; (6) development and housing; (7) civic and advocacy; (8) philanthropic intermediaries; (9) international; (10) religious congregations; (11) business and professional, unions; (12) other.

The ensemble of NPOs is composed of a bewildering array of entities, such as hospitals, day care centers, universities, social clubs, sports clubs, grassroots development organizations, environmental groups, self-help groups, religious congregations, job training centers, human rights organizations, and community associations variously known as belonging to differently named sectors according to specific traditions and countries. At last, different terms along the time in different traditional and cultural context have been coined to name all the different typologies of organizations.

# Delays in Litigation of Judicial Administration in Bangladesh

Abdur Rahman (Zibol)
The Supreme Court of Bangladesh, Dhaka, Bangladesh

## Synonyms

Litigants or Disputants

## Definition

Delays in litigation refers to the degree to which litigants must wait too long, and pay too much, to resolve their disputes which stained to the administration of justice to meet out as promptly as possible.

## Introduction

The provisions of Article 31 and 35 denotes the fundamental rights as guaranteed in the Constitution of the People's Republic of Bangladesh to have a speedy and fair trial in judicial proceedings. Delays in litigation are blight or disease in all the judicial administration. Lawyers preference a delay in litigation as a professional disease or as a privileged anecdote. Access to a reasonable hearing is not a shaggy dog story. Most lawyers and judges familiar with civil or criminal trial practice

agree that the most critical problem is a delay in either trying or disposing of the cause. Judiciary does not work as a single device but a mixed mechanism of linking administrations likely police, land, health, local government, and public administration as well as the people at large. Problems of delay in judicial administration now have been emerged as a national crisis in Bangladesh. This crisis has a multiplier impact negatively on public and social governance. There should be a thorough research study on delays in specific to establish good judicial activism. On this backdrop, the present study to minimize or eradicate the delays in judicial administration aims at (i) analyzing the reasons of delays, (ii) evaluate the problems identified by law commission, (iii) exploring the current status of the delay, (iv) identifying the problems in ensuing delays, and (v) suggesting measures to minimize the existing problems.

Multiple methodologies will be used in this study to ensure its validity, reliability, and objectivity. These primarily include (i) case study; (ii) experts' consultation; (iii) content analysis like books, Internet, newspapers, journals, statutes, charters, law reports, judgments, minutes of judicial conference, and researches on judicial reforms; (iv) observation and participatory method, and so on. Delays in litigation are the violation of human rights and to minimize the alleged problem of administration of justice system, a new device needs to be chalked out.

## Case Study: Craving Justice Crying Silently!!!

Most of the researches and books raise finger as to delay reasons mostly in the civil litigations over the criminal cases. But I dare to say that one-year delay in criminal cases is more crucial than five-years delay in civil cases, because of proving the criminal case largely depends upon the ocular witness than to documents of civil suits. Moreover, painful experiences of custody in a jail in case of innocent persons should also be considered as there are huge false cases in our jurisdiction. The prison in our country is the factory of violation of human rights. Both cases are important because one case gives birth to other cases among the parties or witnesses.

## Cases in Point

i. One newspaper which is popularly known as "Bangladesh Protidin" has published a report on 09.09.2016, Friday, stating that the trial of 35 woodcutters has not been completed in 20 years. Facts leading that on 10 September 1996 in the deep forest of Pakuakhali of Longadu-Baghaichhary Boarder area under Rangamati District the terrorists captured 36 (thirty-six) woodcutters and tortured them inhumanly by tying their hands, legs, and eyes for 3 days and then one Younus Ali had been able to flee away and having information from him the police rescued 28 person's dead bodies and other 7 dead bodies were not found. The heirs and relatives of those 35 victims are crying for justice in the long run of 20 years and it is uncertain when they will get justice.

ii. Zasim who worked in Qatar as a driver is an accused of a murder case and his relative Mr. Monirul Islam came to me and told that one person was killed at night near about the house of Zasim's previous wife in 1996 and thereafter case was lodged against unknown persons and after investigation three persons were implicated including Zasim. As per his version, the relatives of his previous wife implicated him by managing the investing officer and Mr. Monir produce some documents where I found the Sessions case No.1169 of 2001 is pending in Dhaka Court. Thereafter, I inspected the case record where I found that the case has been renumbered as Sessions Case No.11 of 2016 and still pending for further witnesses and it is also uncertain when the justice will meet with the departed soul of the victim.

iii. **A civil suit:** While I was posted as assistant judge of Shahjadpur Court, Sirajganj, then

I dare to dispose of a civil suit of 1940. I have delivered the judgment of the said suit in 2008 and at that time I called the parties before pronouncing judgment and did not find the original plaintiffs/defendants and their sons/daughters but found the grandsons of both parties. Thereafter, I have collected information for this write up that the same case is pending in appeal.

## Causes of Delay Identified by the Law Commission of Bangladesh

The Law Commission of Bangladesh is established under the *Ain Commission Ain*, 1996 (Act No. XIX of 1996). This commission acts on research to identify the reasons for any defects of law or proceedings and suggested measures of the loopholes for enacting the new law, but its suggestions seldom followed by the lawmakers. However, the commission pointed out some reasons for the delay in disposal of cases in the subordinate courts only, which cover both procedural as well as practical loopholes.

These are as follows:

(a) The abundant number of cases in the subordinate courts.
(b) Absence of a specialized court.
(c) Defects of procedural law.
(d) Lack of dutifulness of the judge.
(e) Lack of effective monitoring in the judicial system.
(f) Noncooperation of the lawyer.
(g) Problems in serving process, e.g., summons, warrant, etc., the chance of amendment of plaint and submission of supplemental written statement, and chance of prayer of unconditional interlocutory orders.
(h) Scarcity of logistics of the judges.

However, the law commission is either silent or ignore the matters of stay of litigations by the higher court and accountability of the judges and lawyers which at present is considered phenomenal causes of delays in litigations.

### The Roots of the Problem

It is patently unfair to require a litigant to wait years longer for a decision. The standard legal process need not consume so much time. Legal scholars should identify the roots of the problems to eliminate or minimize them. The following factors are principal causes of delays in litigation:

(i) lack of accountability of the judges and lawyers; (ii) dependency of Judiciary upon other administrations of the government; (iii) the unsystematic management of the judicial administration; (iv) increasing litigations tremendously; (v) the philosophy of procrastination of many judges, lawyers, and one side of litigants; (vi) the priority of trial over compromise; (vii) the loopholes and complexity in the procedural law, and (viii) limitations of the judges and lawyers as well as the lawmakers.

## Reasons of the Problems

### Lack of Accountability of the Judges and Lawyers

Lack of accountability in judicial activities by the judge and advocates caused several factors coupled with the undesirable delays in litigation. The judge and lawyers are not willing to make their staffs and clerks accountable or they could not do this respectively. Lack of accountability in the judiciary paves the way to generate dysfunctions, transparency crisis, and corruption and destroys the fundamental rights resulting in injustice everywhere.

## Dependency of Judiciary upon Other Administrations of the Government

The paramount problem of the judicial administration is to depend upon the other administrations of the government like police who get the vital responsibilities of recording and lodging cases, inquiry, investigation, arresting criminals, giving an expert opinion as to hand-writing/thumb impressions, servicing summons and notices as well as conducting general register cases and giving evidence as witnesses before the court but

their conduct and competency do not ensure to make the speedy and sound judicial process. Another administration of health where the doctors take part in giving injury certificate, examinations of victims, and making postmortem and giving evidence before the court, but their report and availability before the court caused the delay in cases.

## Unsystematic Management of the Judicial Administration

There are two basic streamlines of litigations likely civil and criminal but the judges (including magistrates) have to deal with the proceedings on both sides. The judges have minuscule scope to become expertise even on one side of the vast area of law. A judge is sitting on the chair without proper training resulted in mismanagement of court time, advocates, clients, and staff engaged with the legal proceeding. In Bangladesh, judges have to take training after the appointment and posting and they have to work for nonjudicial activities like staffs' appointment, Nejarat, record room, and coping department within the scheduled time of the court and also lack of logistic supports of judges and sudden transfer without giving posting to another judge there in time cause delay in litigation.

## Increasing Litigations Tremendously

This is a common phenomenon in all jurisdictions of the judicial administration. Peoples' intolerance, interests, and craving to be profitable by dint of any means creating a violation of fundamental rights are paramount factors of arising litigations. More than 80% civil nature cases arising out of the misdeeds the land administration likely Survey Department, Assistant Commissioner (Land) Office, Tahshil Office who mainly work for the record of rights and another malefactor office for registration of deeds where inefficient deed writers, touts and Dalal are available to make mistake and creating false documents beyond mismanagement of Ministry of Land and Law. Besides, civil nature cases also increasing surprisingly due to the authoritative corrupts of various departments of the government due to mala fide, illegal, arbitrary, and inefficient orders relating to the appointment, posting, transfer, and promotion. On the other hand, more than 90% of criminal nature cases are arising out of civil nature cases due making harassment upon the opponents or even to the witnesses and supporters who are willing to establish their civil and political rights at large. It is also important to note that the present village politics and Shalishders of the rural or urban area are malefactors of creating many civil suits and criminal cases. Increasing litigation creates backlog and backlog also creates new litigation.

## Philosophy of Procrastination of Judges/ Lawyers, Etc.

Philosophy is being established by nature, the mentality of the people, and the historical background of the jurisdiction. The legal system of Bangladesh has been oriented from the common law culture. Common law with its adversarial or accusatorial topographies has both its advantages and drawbacks. Some judges and lawyers as well as litigants have led our judiciary to a situation where its demerits are ruling over the merits, manifesting in crippling logjams and delays. Due to procedural law and backlog in the court, the judges and advocates have to take times to cover the stages of trial and traditions buildup that the summons and notice would not be served out in time and the rich party in the case is always tried to consume time to make harassment upon the poor. Finally, justice fails to pay even the winning party of the case, for its costs in terms of time, money, energy, and human emotions are too high.

## Priority of Trial over Compromise

The lawyers and one side litigants are very much willing to go for trial. In civil suits there is a landmark provision for compromise under

section 89A and 89B of the Code of Civil Procedure 1908, and the Judicial Administration of Bangladesh is trying to establish the Alternative Dispute Resolution popularly known as ADR and some visible contribution is seen by the utmost trying of judges, the reluctance of the advocates is also remarkably seen not to compromise. In criminal jurisdiction there are also provisions for summary trials against petty offenses and compromise under sect. 345 of the Code of Criminal Procedure, 1898, in case of certain offenses, thus the judges and advocates both are reluctant to make compromise over the trial.

## Loopholes and Complexity in the Procedural Laws

The provisions of the procedural laws are not properly observed and leaves room to escape speedy disposal for loopholes and complexity in procedural law. Parties showed disinterest to pay requisites fees after filing litigations, so that the summons to the defendant is not served in time. The defendants try to avoid taking summons and notice by managing the process server who has many pretense likely parties not found, and address incorrect and huge workload not to serve the summons in time. Lack of inside discipline and accountability of the judges and lawyers as well as the unwillingness of the judges, emphasized by their statutory noncompulsion, to use preexisting rules and orders to expedite the trial, or to sanction the parties for failing to follow the procedural requirements, meaning that the judges do not take enterprise to employ procedural power already within their grasp, nor do they kind to use of their inherent rule-making authority to accomplish procedural efficiency. Moreover, our procedural laws license taking recurrent adjournments by both parties of the litigation and making interlocutory prayers, orders, and appeals/revisions which fracture the case into many parts and effectively stay the trial. The advocates also have charades to give no confidence upon the judges which also accelerate the cause of delay.

## Limitations of the Judges/Lawyers and the Lawmakers

Limitation as to incompetency inherently developed in judicial administration due to improper appointment, training, dependency, and lack of adequate knowledge to the assignment, which largely depends upon the ignorance of the persons in post and position. It is important to mention that ignorance of the judges is the calamitous for the people.[2] There are serious loopholes in the lawmaking process in our country which priorities one person's will over common people's will and interest as such, which resulted from incompetency or loyalty to the power that makes bad laws for us. The judges and advocates are failed to transform themselves into proficient and accountable ones and they are becoming busy with their petty personal interest in coping with politics so that public interest so far as relates to the litigations suffered immensely.

## Suggestions and Recommendations

Our judicial administration is swimming into a wide scope of corruption which correlates with political influences in respect of appointment, posting, promotion, insufficient salary, and logistic supports. Due to the squat of moral courage and spirit, a judge of the administrative tribunal cannot execute a decree against the law secretary to avoid his harassment. Moreover, the inefficiency of judges, advocates, and prosecution teams as well as nonco-operation of the other administrations connected with the judicial proceedings cause failure to get an easy, speedy, and cost-effective result in the cases. Delay in the judicial process makes the foundation of backlog; rising backlog puts incredible stress on present cases and vice versa. The present rate of disposal of cases and backlog is shocking for judicial administration, rule of law, good governance, and economic progress of the country. Under the present judicial system, the fruits of justice could be enjoyed only by those who could afford its costs. Some suggestive measures are given below to be taken in to account for a

healthy judicial administration in Bangladesh perspective:

## Digitized Judicial Administration

Digital Judicial Administration can make the judiciary more effective, accountable, and transparent. The advocates must file two sets of plaint/complaint, i.e., one as hard copy and another soft copy through online. The judges should forward gist of every order through the website against every case. The interested person can find out the case, order, and current position of the case through the special website of the concerned court without depending upon staff, clarks, and advocates. The parties have to pay enough money to inspect the documents and to have a date of the case. Sometimes failure to get up-to-date information interlocutory matter arises in civil suits and the bail being canceled due to nonappearance of the accused. The public witnesses can get summons through the website of the court. The up-to-date information of the cases will be visible in the website of the court concerned. Even the court may arrange virtual hearing in case of emergency. So, digital judicial administration may minimize unnecessary delays.

## Judicial Administration Should be Separated

A separate administration of the judiciary may be a way out in coping with the present backlogs of litigations. This may happen in the following ways:

a. An exclusive secretariat under the authority of the supreme court having power of transfer and recommendation of promotion of the judges of the subordinate judiciary.
b. The judicial service commission should have the power of recommendation to the appointment of additional judges to the high court division.
c. Top to bottom two divisions of judiciary, i.e., (i) criminal division includes magistrate, joint sessions judge, additional sessions judge, sessions judge, criminal division of the high court, and criminal appellate division; and (ii) civil division includes assistant judge, joint district judge, district judge, civil division of high court, and civil appellate division.
d. There shall be a chief justice of Bangladesh having only supervisory power over the whole judiciary including power of supreme judicial council without power of hearing of judicial proceedings.
e. The service age of the judges should be enhanced, because the judge while obtain maturity in exercise of judicial functions then leaving to retire life, or another job is not a proper justification at all.
f. A good number of judges should be increased and the salary of the judges should be amplified to attract the commendable persons to this career.

## Effective Procedure for Service of Summons

There are many interesting chronicles as to serving of process. The service of summons or processes is not properly got outcome due to procedural technicalities under the prevalent system of the judicial administration. Moreover, the postal system of our country has got failure and not effective enough in providing its service in time. So, there is a patent need to transformation the present system and to incorporate a new dimension of service of summons or process. The following steps may be taken into consideration:

i. The village court/office of councilors can play a vital role in servicing summons as they are well known to the locality.
ii. The parties should submit two sets of summonses or notice and the process server, or assigned police will deliver one copy in the office of the village court/councilors instead of the post office as the postal department has already lost its confidence and another will be served by himself.

iii. Provisions should be incorporated to increase the transport costs for the process server and to make them responsible for the failure of service within the stipulated time.
iv. Government-oriented Internet or cyber network access should be adopted in every stage of the service of summons or process.
v. The parties should endorse their cell numbers and e-mail address for subsequent communications in respect of suits/cases.

## Increasing Court/Process Fees, Etc.

The parties in litigation have to pay unlimited money in a proceeding, whereas the government got not more than 1% cost of the proceeding. The following examples are open secrete to everyone as-.

i. In a mutation proceeding the government at present will get Tk.250/=(taka two hundred and fifty) only as per the circular of 2010, but the parties have to pay Tk.5000/=(five thousand) to unlimited figures and the mutation proceeding must be completed within 45–60 days.
ii. In filing general diary in the police station party is bound to pay at least Tk.500/= (five hundred) and in case of lodging first information it depends upon the identity of the informant, but the government has no gain over the matters.
iii. In filing civil suit/petition of complaint the parties have to pay the seristader, peshker, and peon of the court concerned which is both limited and unlimited. It is also run till the disposal of the litigations.

It is mentionable that parties in the proceedings are very much willing to pay the right amount through ethical ways, but they have to pay more and more amount in an unethical way which also tortured them mentally a lot. So, it is important to increase all kinds of fees to introduce digital judicial administration and to give effective facilities to persons engaged in the proceedings without imposing a burden upon the government.

## Opportunity for Amendment of Pleadings and Adjournments Should be Limited

Amendment of pleadings is a necessary step in case of civil suit. Thus, sometimes amendment of pleadings occurs due to lack of documents of the parties, and ineptitude of the advocates, or the advocates take the adjournments mostly depending upon their busy schedule, or by the government's pleader. There should be a demarcating time within the period of which pleadings may be amended and no adjournment should be granted at the trial stage except on unavoidable grounds.

## Early Disposal of Interlocutory Matters

Appeals or revisions against interlocutory orders which hold up the progress of civil suits and report of expert and publication in newspapers in certain criminal proceedings in lower courts should be given precedence over all kinds of works other than that of an especially urgent nature, and every endeavor should be made to dispose of such appeals or revisions quickly. There is another barrier to early disposal of cases due to stay by the higher courts. So, it must take into consideration of stay at least against order be disposed of as early as possible.

## Examination and Cross-Examination on the Same or Consecutive Day

The examination-in-chief and cross-examination of the witnesses are fundamentals of trial. The appeared witnesses must be examined on the same date and the witness should not go unexamined as it is very troublesome to make the appearance of the neutral witnesses. It is the mandatory provisions that the examination-in-chief of a witness shall be recorded on affidavit. There are straightforward provisions in the procedural law that examination-in-chief and cross-examination of a witness must be completed on the same day or the consecutive day. Thus, the

very provisions are rarely applied in the court due to a pile of cases for witnesses. There should have recorded and printing versions of evidence to avoid tempering in the record by any troublemaker and to avoid applications of recalling witnesses.

## Compulsory ADR Mechanisms

The modern world has attracted seriously upon the process of the mediation, arbitration, and alternative dispute resolution for speedy disposal of cases. In Bangladesh, the Code of Civil Procedure adopts Alternative Dispute Resolution (ADR) mechanisms in Sections 89A to 89C as to mediation and arbitration. It is observed that the parties to the suit are quite ignorant about ADR mechanisms and the advocates are not willing to encourage their clients about ADR owing to the loss of their financial interest. The ADR experiment in many countries reveals that ADR is the only mechanism, which settles down the dispute at the early stage of proceedings and prevents lingering of suits before entering into the trial stage. ADR works like an antibiotic against the long process of disposal of suits. ADR also provides a win-win situation among the litigants. For effective ADR mechanisms, the government should take initiatives to give benefit to the advocates and make a rule to return the court fees to the party concerned and it must be compulsory in every civil suit and case of compoundable offenses of criminal proceedings. Moreover, the advocates and the village courts can play a vital role to prevent pretty cases by adopting pre-dispute resolution, conciliation, and mediation between the interested parties. A single step may make a giant step in future.

## High Court Rules and Order/CRO Mechanisms

The high court rules and orders, criminal rules and orders (CrRO) as well as civil rules and orders (CRO) regulate the official as well as private conduct of the judges and to some extent of the advocates. Most of the high court judges and subordinate judges do not follow the sessions time of court as per the said rules. The advocates are also reluctant to submit Hazira intime according to the instruction of the aforementioned rules and orders. Moreso, the authority concerned must transmit and communicate the records on call for within the stipulated time as ordain in the rules for early disposal of the issues in question. A dynamic and up-to-date version of both can play an effective role in facilitating speedy and early disposal of suits.

## Accountability of Judges

A judge is accountable to his superior authority. The hierarchy of the courts designates the accountability of the judges of the subordinate courts. The supreme court has superintendence and control over high court division and the later possess the same power to all courts and tribunals subordinate to it. The subordination of the courts signposts that the district court is subordinate to the high court division and every civil court of a grade inferior to that of a district court and every court of small causes is subordinate to the high court division and district court I respect judicial activities as well as annual credentials of the judges concerned. Every judge (including magistrate) has to prepare and submit a monthly or weekly statement of his judicial functions which contains a column of disposal of suits/cases. Misconduct of the judge is a common phenomenon, though there are provisions to make the judge liable to departmental proceedings under relevant service rules. The accountability of the judges must contribute to the huge disposal of cases. The accountability provisions in the service of a judge may be said to be better standing if it is properly implemented. The endorsement of accountability may, however, be well thought out in the following perspective:

a. The judge having dual jurisdiction, i.e., civil and criminal should include a certain number or percentage of disposal of civil suits in his monthly or weekly statement, failure to which makes him liable.

b. The judge's monthly or weekly statement should include a column of disposal of suits through ADR.
c. Regular and timely visit by the superior judicial officer over the inferior courts may ensure the accountability of the judges of the subordinate courts.
d. Annual confidential report (ACR) should be made the main basis for the promotion of a judge. There should have a cross-mechanism of checking the ACR and then it should be considered a fundamental basis for promotion, or elevation for the administrative, or any vital judicial posts, e.g., district judge, chief judicial magistrate, and chief metropolitan magistrate, etc.
e. The ranking of the merit list of a judge at the time of appointment should not be the only basis for promotion.
f. Evaluation of conducts of judges by the senior lawyers also may be counted at the time of promotion and or any post of administrative in nature.

## Accountability of Advocates

Unlike judges, there are little accountability provisions for advocates. The Bangladesh Legal Practitioners and Bar Council Order 1972 established the Bangladesh Bar Council which is the controlling and supervisory authority of the legal profession. The Bar Council provides an advocacy certificate to be enrolled as an advocate and administers professional conduct of the advocates. According to the said order, an advocate may be warned, suspended, reprimanded, or removed from practice if he is found guilty of professional misconduct by adopting the process of referring such an allegation of misconduct to the tribunal constituted by it. The Bar Council runs by the elected members from the advocates having its secretariat; consequently, there are, however, the little instances where an advocate had been warned, chastised, or suspended or removed from practice for his professional delinquency. Although, there is a spiraling feeling among the litigants that the advocates are free from accountability and once a case is handed over to them, they may conduct the case whatever means they like. There is no strong and transparent watchdog mechanism to ensure the accountability of the advocates. The Bar Associations are doing nothing but to help preserve the financial interests of the advocates. So, durable transparency and accountability instruments over the advocates may be projected to ensure effective administration of justice. The following acclamations may be well thought out for that purpose:

i. The Bar Council should be the center for ensuring transparency and accountability of the advocates. There should be brought a holistic reform to make the institution watchdog machinery, and its functions should not be limited only to issue bar certificates.
ii. The council should be as institutionalized as a board or university which would regulate and approve the curriculum and administration of the law colleges of the country.
iii. The District Bar Associations should be brought under the actual administrative control of the Bar Council.
iv. After obtaining a bar certificate, an advocate should go in for several efficiency tests based on which his gradation and category are to be determined.
v. An advocate should always vigilant to the practice and he has to prepare and submit a monthly statement of his professional works to the Bar Council through the president of his own Bar Association, which must include disposal of suits in the month conducted by him and which must also include a column of disposal of suits through Mediation or ADR.
vi. Every advocate should have to maintain his tax file and the Bar Council should have to scrutinize and make effective the provisions of professional misconduct in consonance with time and necessity.
vii. Since the administration of civil suits is complicated, involve different branch of laws, and many cases of delay occur due to mistakes or ignorance of the advocates, an advocate who arrived at a certain period of

experience and who obtains a specific grade standard should be permitted to conduct civil suits.

viii. The Bar Council should adopt measures for training to the newly enrolled advocates and after 10 years of practice evaluation of a process for professional conduct and etiquette of the advocates in general.

ix. The Bar Council must come out from political differences to regain its autonomous and independent character as to discharge its duty to protect, preserve, and defend the constitution.

x. The Bar Council should maintain a digital database for every advocate in respect of his provident/contributory funds, fees, and welfare matters relating to health and pensions to make them loyal to the Bar Council.

## Accountability of the Legislature and the Executives of the State

The legislature is the supreme lawmaking authority and all the well-being laws make beneficial the executive and judiciary who has the implementing mechanism of the said law. Judiciary is not a single device but a mixed mechanism of linking legislature and administrations like police, land, health, and the local government. The administrative arbitrariness, unreasonable decisions, and *mala fide* activities violated the fundamental rights of the citizens. Therefore, the citizens ought to rely upon the judiciary which also mounted unnecessary burden upon the judicial proceedings in exercise of judicial review, administrative and civil suits. Moreover, political influences upon the judiciary, inefficient court management, tremendously increasing of cases, and lack of knowledge and accountability of judges, lawyers as well as the lawmakers prop up the causes of delay in litigation. The present judicial structure with existing loopholes in procedural law is not able enough in dealing with the present intricacy arising out of technicalities and intentional delays and practical obstructions.

## Accountability of the Attorney Service

Article 64 of the Constitution of the People's Republic of Bangladesh has established the post of attorney general for Bangladesh, thus no provisions for establishing any attorney service commission and the service of the attorney are depended upon the pleasure of the president, while the government pleaders (GP) and public prosecutors (PP) are depended upon the pleasure of the government and even there is no control of the judicial administration upon them. The temporary service terms already created many obstacles in the early disposal of cases. Moreover, the GPs and PPs did not produce the government's witness in time during the trial, consequently, delays occurred in the early disposal of cases. So, there should a nonpolitical Attorney Service Commission for Bangladesh and the commission shall have the power to nominate the attorneys, government pleaders, and public prosecutors and they will work as permanent judicial officers under the specific service rules and code of conduct bearing with accountability and responsibility as a whole.

## Processes of Land Survey, Mutation, and Registration Should be Updated

Most of the civil suits arise due to defective records of rights including mutation and land registration management. Differences in land portions between Cadastral Survey (CS), State Acquisition (SA), Revisional Survey (RS), and Bangladesh Revisional Survey (BRS) records often raise causes of land disputes. So, it is suggested to update the records which should be made by settling all claims of land records by way of the digital record management system, and by a competent body consisting of, inter alia, judicial personalities, or under the control of the judicial administration. The other important malefactor of increasing litigations is the registration process of deed. The inefficient deed-writers cause injury upon the title of the parties by inserting wrong Khatian/plot numbers or creating forged deed under the instigation of the bad persons of the society.

## Responsibility of the People

Bangladesh is the People's Republic, consequently, all the state organs are accountable to the people at large, thus being citizens of Bangladesh the people has simultaneous responsibilities as well as accountabilities to observe the constitution and the laws, to maintain discipline, to perform public duties, and to protect the public property (Article 21 of the constitution). Be that as it may, the people are not so concerned about their rights and responsibilities, accordingly, their little contribution caused huge embargo upon the judiciary in the dispensation of justice on a speed run. There is no provision of legal educations in the syllabus of secondary and higher secondary education like religious, social, or historical affairs. So, the government can consider the matter in question for building up awareness of the common people as to legal educations. A responsible person shall be vigilant to observe the laws of the country and his helping hand must create an endeavor to a speedy dispensation of justice.

## Ends Demanded Easy Access to Justice

Litigants' craving for justice ends into crying. Constitutional mandates as to fundamental rights have been ignored by our judicial administration. Easy access to justice is nothing but a chronicle of gold deer. However, to easy access and expeditious justice, it is essential to appoint meaningful oath-bound judges from the higher court to the lower courts. It is a matter of fact that the judges of the higher court are over and over again appointed on political contemplation. Due to mental spirit, most of the judges dare to come out of political influences to honor their oath. The judges of the lower courts also appointed by political considerations and they are not sworn with an oath. The aristocracy and discipline in the judiciary are not so high. As a result, the present emoluments of judges are so inadequate and the same do not attract competent people in the said posts to deliver a complete decision in the first instance. So, substantial reforms required to judicial administration in respect of judges' appointments, training internal and foreign posting rules and orders as well as procedural laws to have easy access to justice by the people at large.

## Conclusion

The catastrophe in the judicial administration of - Bangladesh has forgotten the well-known wise saying, "justice should not only be done, but it must also be shown to be done." Delays in litigation remain in the provisions of the procedural laws as well as longstanding practices in the courts, which are designed to aid the delay of cases and eventual success in the case often proves elusive justice. Be that as it may, a single contribution of accountability to create stainless judicial administration may lessen the agony of the litigant in getting proper justice. Every law has definite intention to minimize the difficulties and loopholes and ambiguities in law cannot be the only basis of delay in the disposal and the increasing number of disputes may be responsible for intensifying scope of mechanism which in fundamental nature persuade the parties to take advantage of such mechanisms with intent to cause a delay in the disposal of litigations. O.J Simpson case of the USA, in which trial spanned from November 9, 1994, to a verdict on October 3, 1995, and the case has been described as the most publicized and longest criminal trial in American history in terms of examination of witnesses in the trial. But in our jurisdiction on average a civil suit be ready for framing issues after 2(two) years and a criminal case be ready for framing charge after 1(one) year which initiates the trial. Delays of litigation in our judiciary have reached a point which stained the administration of justice to meet out the litigants to have a remedy as promptly as possible, and the same may be termed as a factor of injustice, and the violative of human rights. Praying for justice is the crying for the parties and becoming a part of a long, stretched, and torturing process and unknown to the ends of justice.

# Delegation of Human Resource Functions: The Jamaican Public Sector Experience

Lois Parkes
University of the Commonwealth Caribbean, Kingston, Jamaica

## Synonyms

Delegated authority; Human resource; Public sector reform

## Definition

Assessment of the impact of the delegation of human resource functions on the quality of the delivery of human resource functions in the Jamaican Public Service context.

## Introduction

The Government of Jamaica, like many Commonwealth and other countries, has been undergoing significant public sector reform, starting in the 1980s. These reforms were aimed at dealing with the fallouts from loss of preferential trade markets, the impact of globalization, and the need to meet the demand for increased public sector efficiency and effectiveness. This process in Jamaica was accelerated in the 1990s, with the restructuring of the Cabinet Office, the formation of the Public Sector Reform Unit under this Office, and the creation of the first four Executive Agencies.

## Context

Given its Commonwealth history, the centralization of Human Resource functions of appointments, promotions, discipline, and separation under a variety of Services Commissions (the chief being the Public Service Commission) was a common feature of the public sector Human Resource System (Lalla 2006; OECD 2009). In keeping with the trends in public sector reform, decentralization was seen as one of the critical philosophies underpinning the reform process. The thinking behind decentralization was that:

1. Centralization separated decision-making from managers, particularly, Heads of Departments and Permanent Secretaries, which often led to decisions being made centrally, that did not take into account the real needs at the point of service delivery to public sector clients;
2. Centralization decision-making was often more time consuming and inefficient, leading to poor levels of productivity; and
3. With centralized decision-making, managers could not be held truly accountable for the delivery of results, which was necessary with the new emphasis on results-based management practices, that was also a key feature of public sector reform (Commonwealth Secretariat 2002; Polidano and Manning 1996).

Decentralization of Human Resource functions became a major feature of the Jamaican public sector reform process, and since 1999, the Government has embarked on the phased delegation of human resource functions under Section 127 of the Jamaica Constitution (Order in Council) 1962. This delegation was first to Chief Executive Officers of Executive Agencies, and soon after to Permanent Secretaries, and some Heads of Departments (Office of the Services Commissions 2000). Between March 1999 to December 2015, delegation of functions was granted to nine Chief Executive Officers of Executive Agencies, 12 Permanent Secretaries, and four Heads of Departments.

The Public Service Regulations (1961) outline the role and functions of the Public Service Commission. With delegation, most of the functions under the Public Service Regulations were delegated, except in relation to the office of Chief Executive Officer/Permanent Secretary/Head of Department as follows:

- Appointments, promotions, and assignment of employees
- Employee discipline
- Mandatory retirement of employees, as well as retirement on medical grounds and on the grounds of reorganization
- Selection of employees for training and study leave in relation to specific Ministry/Agency/Departmental needs

Functions that were also not delegated were retirement in the public interest, and selection of employees for training in keeping with public sector-wide needs and selection of employees for national scholarships.

In keeping with need to improve accountability for the management of these Human Resource functions, each Chief Executive Officer/Permanent Secretary/Head of Department granted delegated functions is required to sign an Accountability Agreement with the Chairman of the Public Service Commission. This Accountability Agreement outlines the functions delegated, the guidelines governing the management of these functions, how accountability will be maintained, and the performance standards expected to be adhered to. The Accountability Agreement is underpinned by a values framework, which links key values with the expected behaviors and performance standards. The key values underpinning the delegation of functions are as follows:

1. Fairness
2. Respect
3. Accountability
4. Merit
5. Equity
6. Integrity
7. Transparency

The delegation of functions also occasioned the reform of the Public Service Commission, and this

saw the introduction of new functions for the Commission. Chief among these are the auditing and monitoring of the delegated human resource functions, and the hearing of appeals against decisions taken under delegated authority. These are the main mechanisms by which the accountability for the delegated functions is achieved.

Between 1999 to 2015, over 60 auditing and monitoring reports were completed by the Office of the Services Commissions, the secretariat to the Public Service Commission. The data collection methods used for each audit were the review of personnel transactions, corporate reports and relevant minutes, interviews with key managers and union representatives, and surveys and focus group discussions with employees using random sampling.

As with all reform initiatives, there is an imperative to evaluate whether the aims of the reform have been met. In the case of the delegation of functions, it is important to answer the question of whether the delegation of functions led to increased efficiency and effectiveness in public service delivery. As it relates specifically to the human resource functions, it was equally important to assess whether the values and expected performance standards and behaviors have been adhered to. Central to the values is the maintenance of the merit-based Human Resource system, a major tenet of the Westminster model of government. There is also the need to assess what are the contributors to this reform's successes and pitfalls, and to determine the lessons learnt for other countries and future reforms.

This research paper is a meta-analysis of these reports. Using the functions delegated and audited, a thematic and trend analysis of the audit findings over the period. The central themes examined are:

- Appointments/Promotions
- Efficiency of the HR System
- Training and Development
- Separation (Retirement and Resignations)
- Management of Discipline
- Human Resource Records Management
- Communication of Staffing
- Performance Management

The main findings were:

a) Appointments/Promotions – Executive Agencies and smaller sized Ministries and Department generally exhibited more consistent adherence to the stipulated performance standards. These standards included filling of all entry-level appointments on a competitive basis, promotion of employees on the basis of open competitive processes, and employees meeting the basic qualifications requirements for the positions in which they were employed. Larger Ministries generally had more breaches of these standards; however, breaches over time did not occur in the majority of appointment and promotions. Additionally, the period also witnessed the introduction of a variety of job selection tools in selection processes, which led to major improvements in job selection decisions. Lengthy acting appointments/assignments of staff (in excess of 6 months in vacant positions) was the most common breach in the area of appointments.
b) Efficiency of the Human Resource System – Generally, across Ministries, Departments, and Executive Agencies, there was greater efficiency in the processing of appointments and human resource decisions generally. However, there were instances where decentralized human resource decision-making was more inefficient than centralized decision-making. Where this occurred, there were weak internal human resource operations system, including delays in the holding of Human Resource Executive committee meetings, and manual systems alongside larger employee numbers.
c) Training and Development – The period saw a greater emphasis on conducting training needs assessment, and aligning training interventions with identified needs. Where gaps in this function were identified, these were correlated with inadequate training management competencies and inadequate funding of training.
d) Separation (Retirement and Resignations) – Within Executive Agencies, there was a high level of efficiency in the processing of retiring benefits. This was impacted by the introduction of a new pension scheme for Executive

Agencies, which allows for greater efficiency in the calculation of pensions. Ministries and Departments with larger number of employees tended to experience more delays in pensions processing, largely due to the manual processes involved and the numerous steps involved in this particular business process. In relation to resignations, there was inconsistency in the collection of data around reasons for resignations.

e) Management of Discipline – Over time, this is one of the weakest areas of Human Resource Management. The common weakness identified was the failure to take disciplinary action that this was required, in the face of evidence that this was needed. Other common weaknesses noted were the lengthy processing of disciplinary cases and lack of adherence to the stipulated disciplinary processes. A major causal factor impacting this area of Human Resource Management is weak competencies of managers in this area.

f) Human Resource Records Management – This is also an area where there were inconsistencies and weaknesses observed. This, in particular, impacted the processing of retiring benefits.

g) Communication of Staffing – Generally, there were greater efforts and mechanisms used to communicate staffing and other issues/information to employees. The use of information and communication technologies, such as website, emails, and intranets have contributed greatly to the more effective dissemination of staffing information.

h) Performance Management – During the period of this research, the Government of Jamaica introduced new target-driven Performance Management and Appraisal systems, first in Executive Agencies, and later in Ministries and Departments. The expectation was that better selection and training decisions, along with robust performance management systems, would result in improved public service delivery. There were, at best, mixed results in this area. In most Executive Agencies, there was more effective implementation of the new Performance Management and Appraisal systems, and better alignment of individual, team, and organizational goals. In most Executive Agencies, these were also tied to the payment of performance incentives. This improvement is exemplified by the receipt of customer service awards by several Executive Agencies. Where gaps were identified in the Performance Management and Appraisal system, the causal factors identified were inadequate and inconsistent implementation, weak culture change management, and limited alignment between organizational goals and individual employee goals.

## Conclusion

Implications and lessons learnt from the Jamaican delegation experience are:

1. Public sector reform initiatives are pieces of a puzzle, and if certain pieces are missing, it results in partial success of the overall reform. In the case of the delegation of functions, there were other reforms that were intended to complement the delegation of functions. One of the major initiatives was the introduction of an ICT-based human resource system. The continuation of manual, paper-based human resource information system led to many of the inefficiencies observed.
2. Another piece of the reform puzzle that was missing is the delay in delegating other human resource functions, such as job classification, organizational design, and compensation. Steps were taken in this direction, but this was halted, owing to fears of spiraling compensation costs, in the context of dire fiscal constraints and the requirement to contain the public sector wage bill, especially in view of the International Monetary Fund agreements that the Government signed to during the period. While these fears were not totally unfounded, it also meant that there were constraints in determining appropriate organizational structures to meet the demands for better public service delivery. In the context of the management of the delegated Human Resource functions, the audits revealed that,

in the many cases where gaps in performance were observed, there was often an inadequacy in the structure of the Human Resource units. This, coupled with the manual business processes, resulted in the weaknesses noted. There were also inconsistencies in the classification of jobs within Human Resource units. As such, some organizations had a challenge in recruiting and retaining the required competencies to carry out of the Human Resource functions according to standard.

3. Effective change management is necessary to achieve reform goals. The greater levels of efficiency and effectiveness observed among Executive Agencies, as compared to Ministries and Departments which had not undergone a similar level of change, can be attributed to the overall change management strategies that were utilized in the creation of most Executive Agencies. This included the creation of new organizational structures, and the competitive process used to fill positions under the new structures. These led to better staff quality. The introduction of new accountability structures, new and, in many cases, automated business processes was also a major part of the change process in these Agencies. These were all accompanied by specific change management strategies, including retraining and communication. In short, the greater alignment of organizational systems, structures, and culture underpinned the improvements realized.
4. Overall, the major fear in relation to the delegation of functions was not realized, which was the breakdown of the merit-based Human Resource system. Compared to the number of Human Resource transactions, the incidences of breaches of the merit principle were relatively few.
5. Going forward, it is recommended that greater attention be paid to change management, reform of the system of organization design and job classification, introduction of an effective ICT-based human resource information management system, and closing the gaps in the Performance Management and Appraisal/accountability systems. These are likely to result in greater overall improvement in public service delivery and lead to higher levels of success in the reform goals.

# Democratic Governance in Bangladesh

Md. Awal Hossain Mollah
Department of Public Administration, University of Rajshahi, Rajshahi, Bangladesh

## Synonyms

Accountable government; Citizen engagement; Freedom of expression; Fundamental rights; Participatory government; Rule of law

## Definition

**Democracy** represents a form of government that is formed by the majority and the majority safeguards the interests of the common people, including minorities. In this study, democracy means a form of government in which power is exercised by the people through their representatives by holding periodic free and fair elections, and by the parliament being accountable to the

people with a view to ensuring equitable distribution of the state resources and equal opportunity for all citizens.

**Democratic governance** refers to a participative manner of governing that functions in a responsible, accountable, and transparent manner based on the principles of efficiency, legitimacy, and consensus for the purposes of promoting the rights of individual citizens and the public interest, thus indicating the exercising of political will to ensure the material welfare of society and sustainable development with social justice. It is a system of government in which institutions function according to democratic processes and norms, both internally and in their interaction with other institutions (such as the private sector, nongovernmental organizations (NGOs), civil society, aid partners, business organizations, pressure groups, professional bodies, and relevant stakeholders).

## Introduction

Democratic governance is *sin qua non* for a peaceful society. Many national and international organizations and scholars have put forward various theories and models of democratic governance. However, better governance is still a very concerning issue all over the world. The aim of this chapter is to evaluate the current state of democratic governance in Bangladesh by highlighting the general conceptual analysis of democratic governance. In Bangladesh, it has been found that most of the basic elements of democratic governance have been recognized and preserved by the Constitution of Bangladesh since independence. However, these principles are being violated in the practice of democracy owing to political turmoil, political instability, lack of trust among political parties, problems of free, fair, and credible election, abuse of power, non-engagement of civil society, and lack of conscious citizens. As a result, the practice of democratic values is hampered in politics and governance, and the violation of human rights is severely enduring in Bangladesh. Despite this, a ray of hope has been noticed in a few policy initiatives related to human rights and governance undertaken by the government. Moreover, some civil society and human rights defender organizations are very proactive with regard to the malicious actions of the government to improve governance and human rights in Bangladesh.

## Democratic Governance

The term "governance" is a buzz word used by scholars, politicians, and academicians in various ways. Simply it means, "the manner in which power is exercised in the management of countries' economic and social resources for development" (World Bank 1992). From a different angle, Kooiman opines that governance is a "blend of all kinds of governing levels, modes, institutions, orders and procedures which refers to the overall pattern of interaction process between different societal and political actors in each specific issue, and the growing interdependence between them" (Kooiman 2003). The opinion of Nicholas (1999) is also worth mentioning; according to him "governance refers to any strategy, tactics, process, procedure or program for controlling, regulating, shaping, mastering, or exercising authority over others in a nation, organization or locality." Thus, it is clear that governance is broader than government. Therefore, governance is not merely government; it refers to a democratic process that encompasses the whole of society. In governance, the private sector, NGOs and other civil society organizations are encouraged to participate in the governance process so that the government can accomplish everything smoothly and effectively.

A pertinent question may now be raised: what is democratic governance? Simply, democracy means representative government and governance means the dealing pattern of government with participation of other stakeholders of a country. Therefore, democratic governance refers to the process by which the government carries out its function by using its resources and strategies, ensuring participation of other existing stakeholders of a country. In democratic governance, a government is elected periodically a by free, fair, and credible election,

to be accountable to the people through their representatives and other forms of vertical and horizontal accountability mechanisms, ensuring peoples' participation with other stakeholders (civil society, NGOs, private sectors, aid partners, professional and other public interest bodies) in key policy-making and the implementation of development and other public services.

The common elements of democratic governance are (Cunningham 2002; Donohue 2003; Sheldon 2004; Citroni 2010):

1. A government elected after a periodic free, fair, and participative election;
2. Rule of law and accountability;
3. Access to information and justice;
4. Engagement of civil society; and
5. Freedom of association.

Based on the above-mentioned five elements, the following section highlights the current state of democratic governance in Bangladesh.

## Democratic Governance in Bangladesh

In theory, most of the basic principles of democratic governance have been reflected in the Bangladesh Constitution. The preamble of the constitution pledges that:

> It shall be a fundamental aim of the state to realize through the democratic process a socialist society, free from exploitation, a society in which the rule of law, fundamental human rights and freedom, equality and justice, political, economic and social will be secured for all citizens. (COB 2011)

In addition, Articles 7 (1) and 11 of the Constitution specifically highlight democracy and democratic governance. According to article 7 (1), "*all powers in the Republic belong to the people, and their exercise on behalf of the people shall be effective only under, and by the authority of the constitution*."

Similarly, Article 11 state that:

> The republic shall be a democracy in which fundamental human rights and freedoms and respect for the dignity and worth of the human person shall be guaranteed and in which effective participation by the people through their elected representatives in the administration at all levels shall be ensured. (Article 11 of COB 2011)

These two articles provide and permit the basic criteria for democracy in Bangladesh. However, Article 70 states:

> A person elected as a Member of Parliament at an election at which he was nominated as a candidate by a political party shall vacate his seat if he resigns from that party or votes in Parliament against the party.

This provision is contradictory to the real spirit of democratic governance and for that reason most of the MPs support the agenda of their own political party, even if it is against the public interest.

How far these elements are exercised in practice has been analyzed below.

### Government Elected by Periodic Free, Fair, and Participative Elections

A free, fair, participative, and credible election is the first and most important prerequisite for a democratic government and governance. It has been 45 years since Bangladesh attained independence and started its journey as a parliamentary form of government with a multiparty (around 100 political parties) political system. Since independence, ten parliamentary, three presidential, and three referendum elections have been held (ECB 2014). However, most of the elections were neither free nor fair and competitive (Khan 2014). Although the experiences of elections held in 1991, 1996, 2001, and 2008 under a nonpartisan caretaker government (CTG) were comparatively competitive, fair, and credible (The Daily Star, March 17, 2014) the provision of CTG was abolished by the 15th amendment of the Bangladesh constitution, which created dissatisfaction and frustration among opposition political parties and drew the country toward an uncertain destination of a free and fair election. For instance, the last election (tenth) held under the ruling AL government was not competitive, as the BNP-led allies boycotted this election and only 39% of voter applied for their voting rights (ECB 2014).

The parliament is run by one party, although the Jatiya Party (Ershad) now acts as the opposition to the parliament, which is part of the AL-led allies. Currently, two MPs of the Jatiya Party (Ershad) act as cabinet members of the current government. This is why the question of acceptability and legitimacy is still fingering from various corners of politics, civil society, and academic scholars of national and overseas domains. It means that the policy and works of the government are suffering from a lack of legitimacy.

Hence, the politics and governance of Bangladesh are practicing a culture of a one party-led authoritarian government instead of a real parliamentary democracy. Besides, the game of blame and claim is another feature of our political culture and as a result, confrontational politics exists, which causes a chaotic and unstable situation in Bangladesh that is detrimental to life, liberty, security, economy, and is a violation of human rights. Therefore, the first and most important requirement of democracy has been absent in Bangladesh since independence.

### Rule of Law, Accountability, and Transparency

The rule of law, accountability, and transparency are interlinked and related to each other and are the three basic and indispensable ingredients of democratic governance. It has been strongly recognized in the preamble of the Bangladesh Constitution (COB 2011), which has been mentioned previously. Besides, several provisions have been articulated for the rule of law. For instance, Article 27 guarantees that all citizens are equal before the law and are entitled to equal protection of the law. Article 31 guarantees that all citizen's rights are protected by the law and no one can perform any actions that are harmful to the freedom, life, reputation or property of any person except in accordance with the law.

In theory, all the essential features of the rule of law are enshrined in the Bangladesh Constitution, but what has been practiced is a matter of concern for this study.

In practice, the scenario is almost contrary and divergent in every aspect of individual life to national life. Confrontational politics is mainly responsible for this. All forms of violation of human rights and the rule of law have been continuing since independence. Few examples of the current state of the rule of law can be mentioned. According to the international organization Human Rights Watch (HRWR 2014), Bangladeshi security forces have frequently used arbitrary and excessive power in responding to street protests and have killed at least 150 protesters and injured at least 2,000 between February and October 2013.

The rule of law offers the opportunity of equal rights and equal protection of the law with an independent judiciary, but in Bangladesh application of the law is discriminatory. The Odhikar report claimed that most of the 184 people killed were from opposition political parties and human rights defenders (Odhikar 2013).

In 2014, a massive killing (7 people) including Advocate Chondon and Panel Mayor Nazrul Islam in Narayanganj was carried out by Rapid Action Battalion (RAB), as disclosed in their self-confession to the Magistrate (Mollah 2014).

Therefore, the theory and practice of the rule of law and accountability are antagonistic in Bangladesh. Most of the provisions of the constitution and other international human rights law, the declaration (UDHR), covenant, treaties, and conventions are violated. However, there are no strong accountability mechanisms to compel the authority concerned to commit a violation of the rule of law. Thus, the most crucial basic elements of democratic governance are also violated in Bangladesh.

### Access to Information and Justice

Access to information and justice are two core elements of democratic governance. Through the option of access to information on the one hand, citizens can know their rights and the duties of the government toward them, and know what the government is doing for them. On the other hand, the transparency and accountability of government actions are ensured. To protect and promote human rights, the Bangladesh government took several initiatives such as the National Human Rights Commission Act, 2009, and the Right to Information Act, 2009, with a view to establishing a national human rights commission

(NHRC) and information service center (ISC). These acts not only enhance the power of citizens to protect their rights and to participate in and attain government programs to obtain their rights, but also enhance the power of various mechanisms (such as the National Human Rights Commission, Anti-Corruption Commission, NBR, CAG, and Parliamentary Committees) of ensuring the accountability of government officials for their misuse of power or illegitimate exercise of power, or any forms of corruption (Mollah 2014). However, the violation of human rights, abuse of power, and corruption still appear to be rampant in Bangladeshi governance.

The most vulnerable sections of society are women, marginalized minorities, and the poor people of Bangladesh, who have little access to justice because of a lack of awareness and financial support. These sections are even deprived of traditional Salish or informal arbitration as they are dominated by local elites such as village moral, political leaders, religious leaders, chairmen, and members of local councils (Momen 2014: 64). The lower judiciary is dominated by the executive from the British period. Even after the separation of the judiciary from the executive in 2007, it has been continuing, and as a result poor and non-elite persons have little access to and are deprived of fair and natural justice (Mollah 2014). Moreover, extra-judicial torture, punishment, forced disappearances, and killing by government law-enforcing agencies and other militant forces are the worst forms of injustice and lack of access to justice in Bangladesh. In recent years, the higher judiciary has proactively taken initiatives to protect the rights of citizens by *suo moto* rules for the incidence of violence against women, children, and human rights overall based on newspaper reports; however, these initiatives are very inadequate instead of incidences happened (Mollah 2014).

Thus, another element of democratic governance is not satisfactory and it is violated in the case of backward and vulnerable sections of society, including opposition political activists in Bangladesh.

### Engagement of Civil Society

Civic engagement or participation in of civil society is one of the crucial requirements of democracy, human rights, and good governance. In Bangladesh, many NGOs have been working for development and awareness building since independence (Zafarullah and Rahman 2002), but in recent years some organizations have worked as defenders of civil society and human rights. A few can be mentioned here: the Center for Policy Dialogue (CPD), Transparency International Bangladesh (TIB), SUJON, Ain O Salish Kendro (ASK), Mohila Porishad, Mohila Forum, BLAST, Odhikar, BELA, etc. The media (both print and electronic) also play a very important role as part of civil society. These organizations are always vocal and publicly disclose and criticize any national policy against the public interest. They always criticize the activities of government and political parties against human rights and the national interest, but appreciate good initiatives. However, a trend has been noticed over the last few years that some so-called think tanks as members of civil society, newspapers, and TV channels are polarized by political ideology, either leftist (AL allies) or rightist (BNP allies). Therefore, the main spirit of civil society was criticized by the common people as they lost their fairness and neutrality.

Now, one question may be: how far are the opinions or suggestions accepted by government or other political parties? For the last 15 years, it has been witnessed that governments have not cared (or cared little within their own ideological organizations) about following their suggestions.

Apart from this, a few organizations are very actively working to protect and promote human rights in Bangladesh instead of the inhuman tortures of the government. For example, ASK, BELA, BLAST, and Odhikar took many initiatives to protect human rights, such as combating violence against women and children, arbitrary arrest and detention, protection of the environment, and extra-judicial killing. Each year they publish their annual reports disclosing the total incidence of the trafficking of and throwing acid at women, disappearance, and torture in custody, extra-judicial punishment, killing, and other

forms of human rights violations. They also help victims with legal assistance through public interest litigation and awareness-building programs.

Hence, the engagement of civil society, one of the core elements of democratic governance, is also vulnerable because of government suppression and domination.

### Freedom of Association

This is another vital instrument of democratic governance and human rights. Article 37 of the Constitution of Bangladesh provides for freedom of assembly and states that:

> Every citizen shall have the right to assemble and to participate in public meetings and processions peacefully and without arms, subject to any reasonable restrictions imposed by law in the interests of public order or public health.

Similarly, Article 38 provides for freedom of association and articulated that:

> Every citizen shall have the right to form associations or unions, subject to any reasonable restriction imposed by law in the interests of morality or public order.

In theory, the opportunities of assembly and association are permitted by the Constitution in Bangladesh, which is used as a platform for expressing the will and opinions of individual rights and criticizes any actions of the government against the public interest. However, these provisions are restricted by reasonable grounds of public security and interest, and the law and order situation of Bangladesh. In Bangladesh, the freedom of assembly and the freedom of association have been violated by government law and order agencies since independence. Most of the cases of assemblies, rallies, meetings, sittings, campaigns, gatherings, and road shows against the violation of human rights, abuse of power and authority, and corruption of government are abolished in the name of public security and the law and order situation, especially programs of the opposition political parties. The confrontation politics of Bangladesh is very prominent and very often political programs are declared by the both ruling party and the opposition political parties at the same time in the same place. As a result, the government declared 144 and prohibits any kinds of meeting, sittings, and gathering in that place. Thus, freedom of assembly and the freedom of association are severely violated.

In addition, the freedom of thought, conscience, speech, expression, press, and media is permitted and guaranteed by the COB, Article 39, but these rights are also suppressed by the government in Bangladesh.

## Concluding Remarks

For a democratic government, a free, fair, credible, and competitive election is a must, but the country is still too delicate to establish a suitable and acceptable mechanism for holding free and fair elections. As a result, most of the elections held in Bangladesh since independence have suffered from a lack of fairness and competitiveness. The rule of law, the protection of fundamental rights, access to information, and justice are core elements of democratic governance. However, the overall governance situation in Bangladesh is upsetting because of the years of constant political carnage. Forced disappearances, extra-judicial torture, punishment, killings, and deaths in police custody are continuing amid communal violence and harassment, destruction of property and religious centers, arbitrary detention and killing of journalists, violence against women and children, and violation of labor rights. Although some steps have been taken by the government to ascertain and ensure the rights of the individual, political instability, violence, and the deteriorating law and order situation produce anxiety, fear, and uncertainty among people. In addition, some of the organizations defending civil society and human rights are very active against the violation of human rights, but are very often victimized by the ruling elites and governmental law-enforcing agencies. All these are a violation of the constitutional provisions of Bangladesh. To protect and promote human rights and the rule of law, the government should be accountable and responsible for upholding the spirit of the rule of law and human rights. Law-enforcing agencies should be transparent and accountable to the law and the people, the judiciary must be free from all sorts

of interventions by the executive and the legislature. The Human Rights Commission, Anti-Corruption Commission, and Election Commission of Bangladesh should be more independent in a financial capacity. In addition, people's participation, including organizations defending civil society and human rights and NGOs in the governance process should be ensured and encouraged by the government by providing adequate independence.

Although the governments have taken various initiatives in protecting and promoting democracy and human rights in various regimes, the overall situation is not pleasing. The National Human Rights Commission of Bangladesh has already existed for around 8 years; however, the institution merely acts as a powerless and incapable executive rubber stamp. As a result, the fundamental rights of citizens enumerated in the Bangladesh Constitution (Articles 27–44) and the rule of law are always violated in Bangladesh.

The role of civil society has been vital in Bangladesh with regard to various issues of governance and human rights from colonial rule to the present day. However, the government has less care for them to correct or change the existing situation of governance. In a democratic society, the participation of civil society is always appreciated and encouraged. Thus, Bangladesh should follow the spirit of real democratic governance. In addition, organizations defending civil society and human rights should also play fair with neutrality.

# Democratic Governance in Developing Nations

Ylva Stubbergaard and Anders Uhlin
Department of Political Science, Lund University, Lund, Sweden

## Synonyms

Developing countries; Global South; Low-income countries

## Definition

Democratic governance: Includes principles such as the rule of law, people's participation, accountability, transparency, responsiveness, effectiveness, and equitable service delivery.

Governance: Implies interactive governing among both governmental and nongovernmental actors, often organized in networks.
State Government: Refers to a governmental hierarchical steering chain with formally regulated competence and responsibilities in decision-making.

## Introduction

A fundamental issue in academic and policy discussions is the role of the state, which role it has, should have, or could have in the governing of a society. Should the state finance, manage, and produce services and deliver goods or should it mainly legislate and regulate relations between societal actors and leave the provision of services and goods to private actors? Together with questions on how state actors obtain power and legitimacy these kinds of fundamental questions are at the core of debates about democratic governance in developing countries. Recognizing that research on democratic governance and policy discourse on democratic governance are often highly intertwined and influence each other, we will deal with both in this chapter. We first need to clarify what we mean by "governance," "democracy," and "developing countries."

## Clarification of Key Concepts

There is no agreement on the definition of the concept "governance." In some literature, particularly within the field of comparative politics, governance tends to be conflated with "government." However, in this chapter the aim is to discuss the new discourses on governance, hence we maintain that governance is not the same as government. "Government" refers to a governmental hierarchical steering chain with formally regulated competence and responsibilities in decision-making. "Governance" implies interactive governing among both governmental and nongovernmental actors, often organized in networks. In this sense various stakeholders are involved in processes of decision-making and implementation. Ideally all involved actors are participating on equal terms (Hooghe and Marks 2001; Hajer and Wagenaar 2003; Bevir 2010; Torfing and Sørensen 2014; Jacobsson et al. 2015). Moreover, the whole discourse on governance is influenced by neoliberal ideological assumptions favoring free markets rather than state interventions. "New Public Management" is an important aspect of mainstream understandings of governance.

Democracy – literally rule by the people – may take many different forms. In modern states democracy typically means that the government is accountable to citizens through regular free and fair elections. Rule of law and respect for fundamental political rights and freedoms, such as freedom to form and voice opinions and freedom to organize are essential aspects of a democratic system. Governance arrangements are more complex than state government in the sense that they typically include both private and public actors in complex networks often lacking a clear hierarchy. Hence, conventional representative democracy might not be applicable to governance where there are no clearly defined citizens, but a number of different stakeholders. This might provide an opportunity for more participatory forms of democracy, as in ideals of "global stakeholder democracy" in which all affected people should have equal say in decision-making concerning a specific issue (Macdonald 2008). In practice, however, such participatory ideals seem hard to realize, whether in local, national or global governance. "Democratic governance" – both when referring to the governing of modern states and in its more complex forms involving state and non-state actors on different levels – typically includes principles such as the rule of law, people's participation, accountability, transparency, responsiveness, effectiveness, and equitable service delivery (Agere 2000).

When referring to developing countries we mean low and lower middle income countries mainly in Africa, Asia, and Latin America. While the diversity in this group of countries belonging to the "Global South" is obvious, they arguably share some characteristics that have implications for democracy. Democratic

governance is particularly challenging in contexts of severe poverty and a history of colonial – and postcolonial – exploitation.

This chapter provides a brief overview of debates concerning democratic governance in developing countries and highlights some tensions in academic and policy discussions on this topic. The two key concepts democracy and governance that compose "democratic governance" have different roots and each of them consists of several complex and sometimes contradicting meanings. When "democratic governance" is used in discourses on developing countries additional tensions are brought to the fore, for instance related to power relations between on the one hand international organizations like the UN, World Bank, IMF, and OECD and on the other hand developing countries. Highlighting such tensions, this chapter aims to open up for complex understandings of democratic governance in developing countries. We begin with a discussion of the transformed meaning of governance, including discourses on "good" and "democratic" governance. Then follows a section on how to assess and measure democratic governance in developing countries. We then consider the outcomes of democratic governance in developing countries, specifically whether it leads to economic growth and reduced inequality or if it is actually harmful for economic development. Finally, we offer some concluding remarks.

## Governance: Good and/or Democratic?

The academic discussions concerning governance are confusing in several ways. First, there is a mix regarding normative and empirical statements. Is governance to be regarded as new steering models in practice that have been empirically recognized and defined or does it constitute a desirable change of steering systems? It seems as the identification and recognition of decision-making in policy networks together with an extensive debate about reduced autonomy and steering capacities in state institutions led to an uncritical shift from empirical assumptions to normative statements. Second, there are controversies in the academic debate of whether this is a substantial shift in steering models or if it is an acceptance and a theoretical adaptation to the fact that governments have never been able to govern in an autonomous and hierarchical way. However, there is clearly a change in the normative opinions concerning what tasks state institutions should take on and changes in dominant ideals of how relations between state institutions and societal organizations should be organized. Ideas of increased importance for nonstate actors in policy-making are in line with political ideologies and public reforms which emphasize the idea of rolling back state institutions. Some of these ideas are connected to neoliberalism and the ideas of New Public Management (NPM) which highlight efficiency in policy implementation and privatization and decentralization in delivery of public services. NPM promotes state institutions to steer policies through goals and control implementation, but not to produce public services (Osborn and Gaebler 1992). These ideas have had a strong influence on international organizations in the field of development and guided their policies for promoting governance reform in developing countries.

The introduction of the concept "good governance" by the World Bank in 1992 is often used as an illustration of an ideological change in how donor organizations promote a new role for state institutions in developing countries (Kaufmann and Kraay 2007; Bevir 2010; Rakner 2014). The World Bank highlighted efficient and accountable management combined with a transparent and predictable policy process to strengthen economic development (World Bank 1992). UNDP's view on governance is more explicitly based on political aspects. "Good, or democratic governance" according to UNDP, "entails meaningful and inclusive participation" (UNDP 2012). There is a strong connection between the meaning of "good governance" and integrity, often used synonymously with the absence of corruption. Hence, corruption is deemed as one of the greatest obstacles to development of good governance. Corruption erodes legitimacy and citizens' trust in the regime (Quality of Government Institute 2016; Rothstein 2011; Rakner 2014). Research and policies on anticorruption have focused on rule of law

and in particular, impartiality of state actors when making binding decisions (Rothstein and Teorell 2008).

Focusing more on democracy within governance, many scholars have stressed a need for new democratic models which may strengthen democracy when new relations between state actors and citizens develop (e.g., Hajer and Wagenaar 2003; Bevir 2010). In particular, a model with participatory dialogues and collaboration in horizontal relations has been influential. This participatory model is discussed in contrast to representative democracy with elected politicians who have a mandate to represent their voters. There are discussions on how compatible these two democratic models are, but for the discussion of democratic governance in this chapter it is enough to consider that the transformation of mechanisms for public influence has consequences for democratic key values like accountability and political equality.

The model of participatory dialogue has been seen as particularly relevant in global governance. Certain democratic values – but not democracy as a political system – have become prominent within global and regional governance institutions in the field of development. Buzzwords such as transparency, accountability, participation, and stakeholder democracy are common in international development discourse. First and foremost this is related to proposals for "good governance" that developing countries are supposed to implement, but increasingly it has been argued that global governance institutions themselves also need to apply such principles of democratic governances in their policy-making (Woods 2000). This has led multilateral development banks and other international organizations to establish accountability mechanisms, transparency policies, and consultation process including a number of civil society organizations. To what extent this trend implies a true democratization of global governance is highly questionable. Rather, it is a form of political liberalization of these institutions that does not fundamentally alter power relations or challenge mainstream development thinking and practices (Uhlin 2016).

As reflected in the preceding discussion, two major dimensions of democratic governance can be identified (Haque 2014: 267). First, "democracy *within* governance," which implies fair, inclusive, and transparent procedures in the governance organization. In the case of states, this typically includes an accountable government through free and fair elections, rule of law, and civil and political liberties. Second, democratic governance may also mean "governance *for* democracy," which suggests that governance should promote rights and freedoms as well as entitlement to socioeconomic needs. In this chapter we consider both the output side (the outcomes of democratic governance) and the input side (democracy within governance). Next, however, we discuss the measurements of democratic governance in developing countries.

## How to Assess Democratic Governance?

Theoretical and policy discussions about democratic governance have been intertwined and have clearly had a mutual impact on which values and indicators should be privileged (cf Bevir 2010). There is a risk that what can be measured turns out to become the norm. Definitions, objectives, and measurements become politically important when deciding which problems and solutions are seen as relevant and which are defined away.

Although there has been a long and in periods intense debate about democracy and good governance, there is no consensus on what goals and indicators should be used when defining and measuring democratic governance. There is not even an agreement among the major international organizations on what level goals, standards, and indicators should be formulated. These difficulties partly explain why the Millennium Development Goals (MDGs) did not include a goal on democratic governance (UNDP 2012). In 2010 leaders on an international summit organized by the UNDP stated that development and sustainability is dependent on democracy when they agreed on "/. . ./the importance of freedom, rule of law, peace and security, respect for all human rights, including the right to development, gender

equality and an overall commitment to just and democratic societies for development" (UNDP 2012).

Recent attempts to create indicators for the assessment of democratic governance have put more emphasis on the process rather than content. The argument has been that if the indicators are developed in dialogue between state and societal actors the process itself will contribute to improved governance. This kind of argument for measuring democratic governance is similar to that of UNDP when the organization underlines that democracy is promoted when democratic governance is formulated and discussed (UNDP 2012).

Definitions and measurements of democratic governance have varied over time and across actors. It must be decided on what political or administrative level the goals should be formulated, and on which level the indicators measuring the implementation of the same goals should be decided. The goals may be formulated on a global level and the indicators on the local level. But the goals may also be formulated on the local level together with the indicators (UNDP 2012). Local indicators would promote better prerequisites for implementation when they are adapted to more specific contexts and especially if they are negotiated in dialogues among different actors as described above. On the other hand, the use of local, context specific criteria makes it impossible to compare countries and assess and rank them.

There are several databases on democracy focusing on aspects like political participation and freedom of expression. Beyond the global databases there are some focusing on regional conditions. Many international organizations also publish country reports. Data collection differs considerably. Many indexes of democratic governance rely on expert assessments. Only a few make substantial use of statistics, because of a lack of reliable data that could be considered valid indicators of democratic governance (Kaufmann and Kraay 2007; UNDP 2012).

One widely used database is the Worldwide Governance Indicators (WGI) produced by the World Bank. These indicators include aggregate data as well as individual governance indicators for 215 countries covering six dimensions of governance: voice and accountability, political stability and absence of violence, government effectiveness, regulatory quality, rule of law, control of corruption. The WGI is important for World Bank policies, but the bank stresses that it is not used when allocating resources (World Bank 2016).

The WGI has been criticized both for the indicators as such and for how data is collected. It could be argued that the WGI indicators emphasize regulations and formal criteria of good governance instead of outcomes and real consequences of governance. Moreover, the value of data based on "subjective" interpretations rather than "objective" statistics has been questioned. A skepticism is expressed concerning whose perceptions the data is based on and in that respect, the risk of biases in experts' assessments. Another discussion deals with the composition of the questionnaires in public surveys.

There are a large number of databases focusing more specifically on democratic governance (See, e.g., Democracy Barometer 2016). Similar criticism as that against the WGI has been raised against major democracy indexes. The basic premises in defining and measuring democratic governance have been challenged. This kind of criticism is often related to what is seen as a fundamental tension between neoliberalism and the idea of promoting democracy. How can developing countries be democratized through an undemocratic ideology? Another kind of criticism emphasizes the "epistemic colonialism" in which Western ideas of governance are dominating. This argument is further strengthened by showing that non-Western scholars are excluded in academic journals on democratic governance in developing countries (Kiely 1998; Kaufmann and Kraay 2007; Haque 2014).

## Democratic Governance, Economic Growth, and In(Equality)

The relationship between democratic governance and economic development has been a persistent focus for social scientists for several decades.

On an overarching level, there is evidence of a correlation between democracy and economic development. Countries with a higher degree of democracy, in general, tend to enjoy higher levels of economic development. However, there is limited evidence on the direction and mechanisms of causality. Focusing on this output side of democratic governance, this section deals with the impact of democratic governance on two aspects of economic development: economic growth and socioeconomic equality.

Some scholars argue that there is a trade-off between democratic governance and economic growth. According to this pessimistic view democracy might be harmful for economic growth (Barro 2008). Economic freedoms (property rights and free trade) generate growth, but democracy (political freedoms) has no positive (and often negative) effects on growth. The policy recommendations stemming from this position is to first establish successful economic institutions (promote market reforms, property rights, and free trade) if the goal is economic progress, increased standards of living, and (in the long time perspective) democracy.

A second position in this debate, by contrast, holds that there is no trade-off between growth and democracy; democracy even promotes economic growth. Some scholars argue that democratic governance promotes economic development, at least in the long run, because accountable government, transparent decision-making, and political freedoms favor economic growth. According to Amartya Sen (1999) and other proponents of this optimistic view, basic political and liberal rights have an instrumental role in enabling people to express their claims to political attention, including claims of economic needs, and are thus essential for economic development. Many of the conditions believed to be favorable for economic growth are indeed related to democracy, including rule of law and electoral democracy to somewhat limit the political power of private capital (Williams et al. 2009).

According to a third position in this debate the kind of regime in place is not decisive for a country's economic development. Following this skeptical view, there is no indications that authoritarian regimes perform better economically than do democracies, but the institutions of democracy are not necessarily the institutions most suitable for economic development. Proponents of this view often refer to the rapid economic growth that has occurred in authoritarian so-called developmental states, mainly in East Asia. The argument is that fundamental social change and nonconsensual policies are often necessary for development when inequality in wealth and opportunities must be dealt with. Democracy is seen as a conservative system of power favoring stability – not change. Consensual competitive politics characterizing democratic systems allow a plurality of interests. A "developmental state" sometimes needs to go against certain sectional interests (of land-owners or trade unions, etc.) and hence risk damaging democratic institutions (Leftwich 2005).

Each of these three positions finds some support in empirical studies. Extant research on democracy and economic growth is inconclusive. A compilation of major studies on this relationship shows evidence pointing in different directions (Magee and Doces 2014). The character of the relationship between form of governance and economic growth differs depending on level of economic development, type of authoritarian regime, regional context, and time period. Differences in findings might also be related to unreliable data. Neither democracy nor economic growth (or other aspects of economic development) are easy to measure and one might, for example, suspect that authoritarian governments tend to exaggerate their growth rates more than do democratically elected governments.

Nevertheless, some general conclusions can be drawn. It is clear that low-income democracies (Botswana, Costa Rica, Ghana, and Senegal) have had more impressive growth rates than nondemocracies. Leaving out East Asia, the economies of poor democracies have grown more rapidly than nondemocracies during the last 45 years. The authoritarian "developmental states" of East Asia that achieved sustained and rapid economic growth appear to be exceptional

cases, and these development processes seem hard to replicate. We can conclude that long-term democratic governance seems to lead to stronger economic performance. However, democratic transitions rarely have immediate positive effects on growth.

Crucially, economic development is not only about growth. Redistribution also needs to be taken into account. Democratic governance has been increasingly common in most parts of the world since 1990. However, during the same time economic inequality appears to have increased in most countries, even if we recognize the uncertainties in measurements of both democratization (as discussed in the previous section) and inequality (Bermeo 2009). Hence, democratic governance in itself does not seem to necessarily lead to redistribution and less inequality. Nevertheless, much research suggest that while persistently high economic inequality can go together with electoral democracy, it has a negative effect on the *quality* of democracy (Bermeo 2009: 24–25). Countries characterized by high levels of economic inequality tend to be low quality democracies at best. Here, again, the form of democratic governance is important. Formal electoral democracy controlled by a small wealthy elite, like in the Philippines, does not lead to improved socioeconomic equality. However, more participatory forms of democracy, like in the Indian state of Kerala, have resulted in reduced socioeconomic inequality.

## Concluding Remarks

It has been demonstrated throughout this chapter that ideas of good governance and democratic governance are complex and ideologically based. This is not surprising. Politics is about alternatives on how to reach the good society. What is important is to recognize different meanings and make the alternatives public and open for debate. Two main lines of discourse on democratic governance have been put forward, two lines that may be combined. One is a policy-oriented approach on how governance should be institutionalized and exercised to best contribute to development in low-income countries. The other approach focuses on democratic theory, participatory dialogue, and partnership in horizontal relations, as an alternative to representative democracy with elected politicians who are held accountable by their voters. It is clear that major international organizations in the field of development mainly take the first approach to governance. In line with the second approach, we suggest that democratic governance means that governance ought to be publicly discussed and institutionalized possibilities for citizens to influence policy are needed.

## Dependent Capitalism and Monetary Regimes: The Case of the Balkan Countries

Comparative analysis of capitalism; Monetary policy; Monetary sovereignty; Varieties of capitalism

### Introduction

Central and Eastern European (CEE) countries experienced two successive waves of systemic institutional changes during the 1990s and 2000s, first the post-socialist transformation and then the integration process into the European Union (EU). These systemic changes have led social science researchers to raise questions about economic models emerging as an outcome of these processes (Chavance and Magnin 2002). Within the theoretical framework of the "varieties of capitalism" (VoC) proposed by Hall and Soskice (2001), Nölke and Vliegenthart (2009) consider that a form of "dependent" capitalism has been developing in East Central Europe (the Czech Republic, Hungary, Poland, Slovakia) since the 2000s, as a result of these transformations, marked by the role of foreign capital in economic dynamics. This hypothesis has met growing interest and relevance in the context of the 2008 economic and financial crisis (Drahokoupil and Myant 2011). The crisis brought to light the weaknesses of East-European economies, with their strong exposure to foreign market risks and their structural dependence on foreign direct investments. And then, the COVID-19 crisis highlighted the problems caused by

excessive dependence and a possible disruption of international production chains.

However, the issue of the monetary regime is not addressed in the VoC analysis. A monetary regime can be considered as a structuring institutional form, a set of rules expressing the power relations between national and foreign actors. The monetary regime includes rules related to the external dimension (exchange rate policy) and the domestic dimension (money supply or interest rates policy). Monetary regimes can also be described as "dependent" in Central and Eastern Europe but to varying degrees. Most of the new EU member states have gradually restored a relative independence of their monetary policies, by adopting a policy of inflation targeting or in joining the euro zone, which, however, means sharing their monetary sovereignty with other members of the euro zone.

As a separate group, the Balkan countries are characterized by a stronger dependence, regarding both foreign capital and monetary regimes. Currency boards in Bulgaria and Bosnia and Herzegovina, unilateral euroization in Montenegro and Kosovo, and de facto fixed but adjustable exchange rate regimes in Albania, Croatia, Macedonia, Romania, and Serbia (even if some of these countries are officially promoting a policy of inflation targeting) are all examples of monetary dependence. Monetary regimes in the Balkan countries both strengthen and protect the institutional configuration of dependent capitalism and thus contribute to its overall coherence. Hence, monetary dependence can be considered as one of the founding institutional elements of dependent capitalism.

## Dependent Capitalism and Monetary Regime: Theoretical Considerations

### Dependent Capitalism in the Visegrád Countries

Nölke and Vliegenthart (2009) assess that a new variety of capitalism has been emerging in East Central Europe since the 2000s: the "dependent market economies" (DMEs). Their theoretical framework directly derives from the VoC approach by Hall and Soskice (2001), which makes a distinction between two types of capitalism: the "coordinated market economies" (CMEs), with Germany as a case in point, and the "liberal market economies" (LMEs) exemplified by the United States. The DMEs broaden this initial binary typology.

Nölke and Vliegenthart believe that DMEs can be considered as a genuine variety of capitalism, different from both other models, because its founding institutions, as Hall and Soskice define them (industrial relations, education system, corporate governance, interfirm relations, and employment relations), exhibit strong complementarity and coherence.

The salient feature of the DME variety is a strong dependence on foreign capital, while the main source of investment is foreign direct investment (FDI). Corporate governance is then dominated by the hierarchical control of transnational companies' headquarters, which becomes the central coordination mechanism in DMEs, in contrast to markets and contractual relations in LMEs or networks and associations in CMEs.

The position of employees appears to be weaker than in the coordinated market economy, because transnational corporations look for cheap but skilled labor force and may rely on the competition among post-socialist countries to attract foreign direct investments, but the labor legislation is less flexible than in the liberal market economy in order to avoid social troubles that could impede production.

Tax competition and low taxation to attract FDIs result in limited government spending on education. Moreover, major investments in research and development are not necessary, while most of it is carried out within transnational companies' headquarters and then integrated into the subsidiaries' production processes, innovation remaining under the control of the corporate hierarchy. The DME countries in East Central Europe demonstrate a comparative advantage in the assembly and production of relatively complex and durable consumer goods, which are then reexported. This comparative advantage rests on the availability of cheap but skilled labor force, technological transfers within transnational

corporations, and capital inflows through foreign direct investments.

Dependent market economy should not be considered as a flawed model. On the contrary, Nölke and Vliegenthart (2009) believe that the post-socialist dependent capitalism in East Central Europe is a rather "stable and fairly successful" economic model – "particularly when compared with most of the other transition countries" (p. 693). Institutional complementarity is the major reason explaining the coherence and stability of the model and the comparative advantage of these economies. Until the 2008 crisis (and even during the crisis), the Visegrád countries were among the best performing countries in terms of sustained economic growth and per capita GDP. The modernization of industries, technology and know-how transfer, and catching up with Western Europe can be mentioned among the positive results.

Still, the authors acknowledge the vulnerabilities and risks of this dependent type of capitalism, especially the dependence on imported industrial goods, investment decisions of foreign-owned firms and banks, and exports to Western markets. They also warn on the probability of Central European DMEs not being able to upgrade their economic models from their semi-peripheral position, unlike Ireland which has succeeded in catching up with the most advanced European economies.

## Monetary Regime as a Structuring Element of the Comparative Analysis of Capitalism

Surprisingly, most attempts made so far for classifying types of capitalism in post-communist countries have disregarded an important institutional element: the structuring role of the monetary regime. It is notably the case of the VoC approach but not of the French School of *Régulation* (Boyer 1990; Amable 2003). The "dependent capitalism" hypothesis is thus ignoring the importance of the monetary regime and the monetary system.

Firstly, money is a pivotal institution not only for the economic but also for the social system as a whole. The monetary regime and the monetary system of each country indicate, both statically and dynamically, the power relations between the major economic and social actors. The enforcement and evolution of monetary regimes is the result of various coalitions of interest groups, either economic, political, or geopolitical ones. At the same time, monetary regimes convey a definite system of values. It is of major importance to pay particular attention to the "domestic (national)/external (international)" dividing line. This dividing line determines the degree of "dependence/independence" of individual countries' monetary regimes as regards external actors (be they countries, corporates, individuals, etc.). It can lead to the existence or absence of monetary sovereignty, to sovereign and independent, or to dependent and subordinate monetary policy. Not surprisingly, a perfect monetary sovereignty is becoming increasingly difficult to be implemented in today's global and interdependent world.

Secondly, as a working definition, "monetary regime" is here considered as a system of formal monetary institutions and rules of monetary behavior. In a broader sense, a monetary system comprises not only formal rules (monetary regime) but also informal monetary rules, informal monetary practices, and country-specific or region-specific monetary behaviors. When defining the core elements of a monetary regime, it seems appropriate to differentiate between two components, namely, the rules of conducting a monetary policy (rules regarding the domestic value of money, i.e., the relation towards the value of goods and services) and the type of exchange rate regime (rules regarding the external value of national currencies, i.e., the relation to other currencies).

Thirdly, the "dependence/independence" of the national monetary regime may emerge in different forms and different degrees. "Independence" means the following core elements: (i) the ability of an independent performance of the main functions of money (unit of account, means of payment, medium of exchange, store of value) and (ii) the capacity to raise seignorage, i.e., monetary revenue. It also refers to (iii) the ability to pursue an independent monetary policy, i.e., to influence money markets, either

through quantities or through money prices (interest rates), and (iv) the ability to perform the function of lender of last resort (LLR) and the functions related to financial stability. And finally, independence means (v) the ability to symbolize a given national community, its political independence, its cultural identity. The monetary sovereignty can be regarded also as a continuously developing system of values as regards money and the monetary system, marked by the historical context and national specificities.

However, history shows that a country can never have complete monetary independence. This fact comes as a result of the interwoven monetary spaces and of the hierarchical nature of monetary systems. The monetary dependence can be both formal, through certain legal rules, and informal or spontaneous, such as "currency substitution," for example. Hence, the design of the monetary regime indicates the degree of "dependence/independence" of a monetary regime with regard to its external side (exchange rate regime). For example, fixed exchange rates point to stronger dependence of a country on external monetary policy, on the value of the monetary anchor to which a national currency is pegged. Next in line come currency boards in which, in addition to a fixed exchange rate, monetary policy is almost completely eliminated. There follows the unilateral adoption of a foreign currency as a legal tender, in which case monetary revenue is brought to zero. In the above ranking of monetary regimes, monetary sovereignty gradually decreases to be entirely eliminated in the last case. The above classification includes "monetary unions," where monetary sovereignty, at least formally, is pooled, shared with other countries within a common currency area, which also means a common monetary policy (e.g., the euro zone or the African CFA area). Nevertheless, it is self-evident that hiding behind the formally shared sovereignty looms the real dominance of a particular country – a leading economic, political force within the framework of the monetary union (like Germany in the euro zone).

As a whole, the (formal or informal) monetary hierarchy cannot be eradicated. Strong and weak currencies have always existed in history. The historical dependence and hierarchical subordination of monetary regimes in the Balkan countries have also been a well-documented fact since the time of the Latin Monetary Union, when Balkan governments gaining their independence from the Ottoman Empire unilaterally adopted Latin Monetary Union rules (Nenovsky and Vaslin 2020).

Fourthly, going back to the issue of "dependent capitalism," monetary regime could be considered as one of its major analytical elements, because of its structuring role as a central institutional anchor as regards the other leading institutional components defining the existence of "dependent capitalism." The concept of institutional complementarity is most relevant here (Amable 2003). The type of monetary regime is indeed tied up with the balance of payments' structure (FDIs, trade flows), with the nature of public finance and tax regime, with labor market conditions and welfare system, as well as education, etc. It may be contended that core institutional forms have been created or evolved in a manner, which makes them mutually complementary and supportive in time. More specifically, the dependent monetary regime is servicing foreign capital, which is a leading element in the system. Foreign capital and monetary regime, on their part, determine the presence of foreign banks, the need of security in "profit recycling," etc. This requires a stringent budget policy (primarily expenditure restriction) and in general a minimum government interference on a national level. Low and predictable taxes (often a flat tax), light social burden, and certainly a flexible labor market, where labor is cheap and is easily hired and made redundant, are all elements of the same basic institutional set, which allows us to refer to a model of "dependent capitalism."

## Dependent Capitalism and Dependent Monetary Regime: The Case of the Balkans from 1990 to 2015

### Evolution of Monetary Regimes in the Balkans After 1990

At the beginning of the 1990s, two groups of countries, following different transition trajectories,

including the adoption of various monetary regimes, came to the fore. Within certain conventions, two types of development were discerned, *type 1* for Central European countries (Poland, Czech Republic, Hungary) and the Baltic region, which were later joined by Slovenia, and *type 2* for Balkan economies (Romania, Bulgaria, Albania, and the former Yugoslav Republic countries).

Generally speaking, *type 1* was more successful and was characterized by an orientation to Western models of development, institutions, etc. Economic policy, institutional reforms, and overall behavior of economic operators were directed to Western Europe to attract capital and expertise. The countries of this group voluntarily delegated part of their economic sovereignty and sacrificed their independence in favor of Western European countries and economic actors. That corresponded to their desire for quick emancipation and for breaking away from the influence of Russia (Feldmann 2013). Within that configuration, FDI and external participation in privatization became leading forces. The role of the national state was reduced to the minimum, dictated by foreign actors' interests. Values of a free market economy and a liberal shock therapy became pivotal. Logically, this brought about the choice of a monetary regime servicing the selected development model, namely, a stable external value of national currencies within the framework of a fixed exchange rate regime, a strong presence of foreign banks, etc. It meant for those countries "to climb in the hierarchies of currencies" and in the case in point to peg to the German mark, Europe's central currency. The fixed exchange rate had the advantage of limiting the crony transition and the opportunities for speculation, as well as state and central bank captures. As reforms were unfolding and privatization completed, and mid-1990s crises left behind, the countries of group 1 started to emancipate and regain part of their independence and sovereignty. This process also transpired in the monetary regime evolution: most countries transited to one degree or another to a floating exchange rate or inflation targeting.

Countries of *type 2*, roughly speaking from the Balkan region, embarked on an opposite path. The mutual attraction between these countries and Western Europe was weak, due to a number of historical, geographical, and other factors. In the Balkan countries, national elites and the socialist ruling top succeeded in preserving their positions and became a major factor in the post-communist transformation. External factors, Western Europe influence in particular, held a secondary role. In this context, the state had a significant impact on the economy and, having been captured by the abovementioned elites, became a major factor in the redistribution of ownership and wealth. The state was overburdened with discretionary policy tools, including control over the country's monetary system and the central bank's policy. The monetary regime was so constructed as to serve the colossal redistribution process in favor of the communist upper crust. The floating exchange rate and the "crony" discretionary monetary policy became the leading transmission mechanisms of that redistribution. The public sector was drained of resources, which were privatized, while losses were passed on to the budget and into state-owned banks. The whole process found its logical end in printing money.

Once privatization was completed and internal sources of capital formation depleted, and after the 1990s crises, Western influences started to gain momentum in most of those countries. The monetary regimes also changed in nature and became externally dependent and controlled. The currency board in Bulgaria (of mid-1997) is an evidence of this. Yugoslavia put up long resistance, but geopolitical and economic factors led to its disintegration. The separation of Slovenia (1991), Macedonia (1991), Croatia (1991), and Bosnia and Herzegovina (1992), subsequently of Montenegro (2003) and Kosovo (2008), logically brought about the adoption of external monetary regimes oriented towards Western Europe. The adoption of the Deutsche Mark, subsequently of the Euro as the official currency in Montenegro and Kosovo, was ultimately aimed at their breakaway from Serbia.

During the period under study (1990–2015), monetary regimes are highly dependent in Bulgaria, Bosnia and Herzegovina, Montenegro, and Kosovo. By all means, during the years

1990–2015, the Balkan countries are characterized not only by formal monetary dependence and loss of monetary sovereignty but also by informal monetary dependences, manifested in a large-scale and strongly expressed monetary substitution.

## Monetary Regimes with Limited Sovereignty: Currency Board and Unilateral Euroization

This section will provide two examples of dependent monetary regimes, namely, currency boards in Bosnia and Herzegovina (1994/1998) and in Bulgaria (1997) and unilateral euroization in Montenegro (1999) and Kosovo (1999).

### Currency Boards (1992–2015)

Immediately after the collapse of the communist system, in the very early 1990s, the currency board (CB) was not among the instruments used by the international financial institutions (IFIs); it failed to fit into the models used by the IMF. Very quickly, however, after certain resistance and hesitation as regards the introduction of the CB in Estonia (June 1992), the IMF and international experts started treating this monetary regime with higher regard. This emerged at the time of implementing this system in Lithuania in April 1994 and in devising the de facto CB in Latvia. After the CBs in the Baltic states proved efficient not just in geopolitical terms but also by providing monetary and economic stability, IFIs, and among them the IMF, included them more actively in their programs. The extremely negative attitude to this type of regimes was overcome at least partially, and they were no longer treated as an aberration from normal monetary policy, as a legacy from the colonial system, or as specific solutions for highly unstable and underdeveloped countries. Logically, CBs began to be treated as a system worth of attention.

In a nutshell, CB is a regime under which the monetary sector is closely related to the dynamics of the balance of payments; monetary policy is totally or almost totally eliminated; the exchange rate is fixed, in most cases by law; and the monetary base is covered with highly liquid foreign assets. In this case, money supply cannot be influenced by the central bank: domestic sources of monetary base are non-existent; the independent monetary policy is eliminated, as is the function of the LLR; while seignorage is limited. Considerable foreign currency reserves are maintained, which should ensure the credibility of and confidence in the national currency, but at the expense of investing these reserves abroad and not domestically. To maintain such a regime, disciplined public finances, presence of foreign banks to be refinanced by their parent banks in case of a crisis, and a considerable inflow of foreign capital are deemed to be required.

Thus, very quickly, the CBs found their foothold on the Balkans. This happened owing to two main reasons – economic and financial in the case of the CB introduced in Bulgaria in June 1997 and geopolitical and financial in implementing the regime in Bosnia and Herzegovina in 1994/1998.

The unification of the monetary space in *Bosnia and Herzegovina* was completed in legal terms on 1 July 1998 with the introduction of the CB and of the common currency for the three ethnic zones (Bosnian, Croatian, and Serbian), known as Convertible Mark (KM). This was implemented in practice in the end of 1998. Since then, the CB has existed under the initial conditions, and there has been no criticism voiced against the regime. However, the background of the CB is both interesting and edifying. Without getting into details, we would note that the major factors here are geopolitical – the interests of Western Europe, the United States, and IFIs.

After the independence of Bosnia and Herzegovina was announced in March 1992, the payment community/space started to disintegrate, and several currencies were put into circulation, depending on the actors' ethnic and trade preferences (various types of emergent currencies, alongside with officially accepted *Novcani Bons*, Deutsche Mark, Serbian Dinar, Croatian Dinar, *Kuna*, etc.). During the same year, the first independent banknotes were issued, which were in circulation together with the Deutsche Mark. In general, the situation was quite chaotic. During the war, which started in May 1992, the country was in the grip of hyperinflation, as was Serbia. In August 1994, the first CB was introduced in the Bosnian territory, after the Bosnian Dinar was

redenominated and subsequently pegged to the Deutsche Mark at an exchange rate of 100 new Dinars = 1 DM, and the new currency was backed 100% with Marks.

Subsequently, events developed in the following way. After the Dayton Peace Agreement for the establishment of a federation put an end to the war in December 1995, there were actually three monetary zones – a CB on the territory of Bosnia, the Kuna in the Croatian zone, and the Serbian Dinar in the Serbian area. These three zones shared in common a peg to the Deutsche Mark, which acted as an anchor for the three systems. Under the pressure of the IMF, the US Treasury, and a number of Western European countries, a decision was made to establish a common CB, integrating the three zones. The other options were introducing the Deutsche Mark as an official currency or creating three mutually interrelated CBs (Coats 2007). After some discussions a new central bank was established, operating under a CB regime, and a new currency, called Convertible Mark (KM), was put into circulation. Thus, from June 1998 1DM = 1 KM, and since 2002 1 EUR = 1.95583 KM.

The CB in Bosnia and Herzegovina is extremely conservative and was initially designed to be governed by a foreigner appointed by the IMF. The first Governor was Peter Nicholl, from New Zealand (who held the position for 7 years and was replaced in 2005 by Kemal Kozaric from Bosnia). The cover of the monetary base should be above 100% (not exceeding 100–110% by law) and at least 50% of the reserves in the reserve currency. According to Steve Hanke, the CB in Bosnia and Herzegovina is the closest to the orthodox form: the value of its sterilization rate, which shows the monetary authorities' capacity to influence the monetary base, is next to zero (Hanke 2002). It is stipulated by law that the CB should grant no loans, whatsoever, to the government in the first 6 years, and thereafter this may be allowed by Parliament. Today, the official exit of the CB is considered to be joining the euro area; no mention is made of an independent monetary policy.

While the limitation of Bosnia and Herzegovina's monetary sovereignty may be contemplated as a resolution of the war and of ethnic conflicts, the CB in *Bulgaria* is a different story, principally initiated for financial and economic reasons. A CB was introduced in Bulgaria after the colossal collapse of the banking and economic systems in 1996 and the default of foreign debt servicing. The CB was officially introduced in June 1997 (under IMF pressure and external factors). The story has been frequently analyzed and presented (Berlemann and Nenovsky 2004).

As has already been mentioned, in the early 1990s, the transition was dominated by the former communist elites, which converted their power resources into ownership and assets within a few years. They became the new capitalists and rentiers. The state was the main transmission mechanism through which plundering and redistribution took place, and the monetary regime was so structured as to serve those processes. The external actors were in an extremely unfavorable position. They did not participate directly in the privatization processes. They mostly used to grant loans to the Bulgarian state, i.e., to the same domestic communist elites. It is worthwhile noting the rejection of the early ideas of implementing a CB, known as the Rahn-Utt Programme (a project funded by the American Chamber of Commerce in 1990), that de facto aimed at introducing a CB and giving room to market forces in order to strengthen the positions of external actors.

Subsequently, the accumulated foreign debt proved difficult to service very quickly, and the crisis hit as a logical consequence. At that point, a radical overhaul of the monetary regime took place, as the IMF (whose role at the time of the crisis was extremely questionable) and Bulgaria's foreign creditors imposed the CB system. The new regime aimed at establishing an institutional monetary framework, which should ensure the future foreign debt servicing and the security of foreign capital. Monetary policy was completely eliminated, and the LLR functions were highly limited. The pegged exchange rate and the monetary base coverage rate as well as the publication of CB's balance sheets were enforced by law. Initially pegged to the Deutsche Mark at a 1:1

rate, the Bulgarian Lev is still fixed to the Euro at the same rate as in Bosnia and Herzegovina, 1 EUR = 1.95583 BGN. Both in Bosnia and Herzegovina and Bulgaria, the national monetary policy is directly tied up with that of the ECB.

In the CB case, it is worthwhile noting that a monetary income or seignorage is generated, though at a lower rate (which is allocated between the monetary authorities and the budget). National currency is also printed and remains a national symbol (e.g., in Bosnia and Herzegovina, the design of the banknotes contains common and specific elements for each of the three communities).

The determining role of external factors and the subordinate importance of national elites in the choice of a CB in Bulgaria and Bosnia and Herzegovina are indirectly confirmed by one of the recent surveys on CB's credibility in both countries (Begovic et al. 2015).

### Unilateral Euroization (1998–2015)

A still more radical restriction of monetary sovereignty was the unilateral adoption of the Deutsche Mark and subsequently of the Euro as an official currency in the case of Montenegro and Kosovo, called euroization.

Taking a look at *Kosovo*, we can immediately observe that the change of the monetary regime has been directly devised by external forces (United Nations Interim Administration Mission in Kosovo, the US Treasury, IMF, NATO, etc.). The start was given after recognition by Western powers of the self-proclaimed Republic of Kosovo in May 1992 in violation of UN norms. After the cease-fire in 1998, the Deutsche Mark was declared a legal tender, initially alongside with the Serbian Dinar, and subsequently on its own (this happened on 2 September 1999). The Central Bank of the Republic of Kosovo was established in 2008 and decided to undertake the changeover from the Deutsche Mark to the Euro (about one million Marks were exchanged in cash). It is mainly concerned with banking regulations, the payment system, and the management of government finances.

As regards the causes of introducing the Euro in *Montenegro*, it resembles the imposition of a CB in Bosnia and Herzegovina. In the first place, it was a geopolitical decision, imposed from outside (Germany in particular). The facts and technical details are also well known. The decision for the separation of Montenegro from Yugoslavia, the last republic remaining in the Federation, was not only accompanied but also implemented mainly by leaving the Yugoslavian Dinar zone.

In early November 1999, a decision was made that the Deutsche Mark should be in circulation in parallel with the Dinar, at a floating exchange rate – it is not sure whether it was coordinated or directly imposed by Germany and the Bundesbank.

From January 2001, the Deutsche Mark became the only legal tender, and, since June 2002, it has been replaced by the Euro. Paradoxically, euroization seems at first sight to enable monetary policy. Montenegro's system, unlike that of Kosovo, allowed, at the end of the period under review, some attempts to regulate monetary policy (open market operations, reserve requirements, etc.). The case in point of course is a monetary policy in euro (i.e., the money supply cannot be increased, but its structure may be changed within certain boundaries). In both cases of euroization, however, the money supply is a direct result of the balance of payment dynamics. It mostly relies on foreign capital, remittances, and IFIs' official aid.

## Conclusion

Dependent capitalism is marked by the structuring role of foreign capital in national economic dynamics. The monetary regime was not included in Nölke and Vliegenthart's initial contribution, nor was it in Hall and Soskice's theoretical framework, but it appears to be complementary with other institutional forms, some of which have been mentioned by the authors (tax regime, social welfare, education system, labor market, etc.). First focused on the Visegrád group, the extension of the dependent capitalism analysis to Balkan countries, to EU new members or non-members, appears particularly relevant.

Balkan countries' experiences provide almost perfect examples of dependent, orthodox, and

limited monetary regimes, such as currency boards and euroization. This was the case of Bulgaria, Kosovo, Montenegro, and Bosnia and Herzegovina. In other Balkan countries, where such rigid monetary rules were not adopted, the de facto monetary regime and policy similarly followed external anchors and targets. These monetary regimes could be analyzed as institutional compromises, resulting from interactions between economic, political, and global interests in the Balkans and core Western countries' players. Dependent monetary regime also appears as a key element of the whole structure of DMEs that presupposes market liberalization, i.e., free labor market, low wages, conservative public finances, and dominant level of foreign capital and foreign banks.

The COVID-19 crisis and the vulnerabilities it revealed could lead to a shift in the forms of capitalism in Central and Eastern Europe towards less dependence and more sovereignty, in the context of Brexit, with an increased role for the state and public policy.

## Introduction

Ottoman Empire has been a kind of "security community" by covering most Islamic countries in Middle East region for a long time. So it can be said that Ottoman Empire has achieved Karl W. Deutsch's economic-orientated "security community" model in the context of political scene in their age.

Approximately 49 states emerged from Ottoman Empire ruins, and they have been mostly colonized by the Western countries after the World War I. But they have gained their independence after the Second World War.

Nevertheless, after the independence, bilateral and multilateral relationship has been low level with both each other and especially Turkey which is the successor of Ottoman Empire.

There are many reasons, but most salient ones is that Turkey has turned his face to the West and refrained from developing close relationship with the other Islamic countries in sake of Westernization.

Interregional relationship also was low level between Middle Eastern countries because of the post-colonial problems such as border conflict, clash of interest, ethnic and sectarian problems. So each country securitized it's foreign relation and policy in the region. Therefore, the Middle East region became one of the most insecure and unstable places of the today's world because of threat perceptions. So this paper focused on the question on how to deal with security problems of the Middle East region.

The main assumption of this paper is that international security problems must taken hand with its their regional character and solved by interdynamic. So this research has been built on the regional security complex theory (RSCT) via constructivist approaches.

An exclusive offer of this research is that there must be regional cooperation in the Middle East. And Turkey's new direction of foreign policy would be good model for desecuritization of the multilateral relationship in Middle Eastern countries. Turkey is a very special country because of its historical and specific gravity on the region. Besides Turkey is only democratic and secular, moderate Muslim country with its conservative social character.

Another crucial problem is the radical movements in the Middle East. It became not only a regional but a global problem. Duality and lack of religious authority in Islam has caused chaos and feeds religious extremism. In fact Islam doesn't require any central religious authority like the pope or Vatican. But it doesn't mean that there would not be any consensus about Islamic issues. The function of caliphate was to represent consensus in Islamic world in the Ottoman's time by force of the state. Herewith, Ottomans was not letting emerging of any radicalism in the Islamic world because of they represent moderate Islam. But, abolishment of the caliphate has caused the reduction of influence of the moderate Islam all over the Islamic world and led to chaos in Islamic issues.

This paper interests in how this problem would be solved. Rising of Turkey as a regional power has caused some hope for regional cooperation by way of desecuritization of multilateral relationship. So, Turkish experience both domestic and international policy level would be good model for the development of regional cooperation also. Fallowing chapter include regional security complex theory and regional security problem of Middle East. Research environment is limited by only Middle East countries because of others covered by another subregional complex.

## Regional Security Complex Theory

The Regional security concept is a historical and geopolitical approach to the security problems of the post-Cold World era. It's enabling to analyze and explain development within any region.

So, regional security approach is a modern time's phenomenon where its root is reaching back to the interval between 1500 and 1945. It's a subsystem of the global world system. So, we cannot mention about regional approach before 1500 because global level was not strong enough to generate a global world system (Buzan and Waver 2003, p. 15).

The world system refers to the inter-regional and transnational relation which is shaped by economic and geostrategic priority. Regional security also related with global rivalry among European power in local unit (Buzan and Waver 2003, p. 15). Because dividing of world in controllable area is the characteristic of the imperialism, for example, the world has divided according to the colonial interesting area in pre-Cold War time, there was a bipolarity in Cold War time; now the world has been divided into the two camps as *zone of peace* and *zone of conflict* in the post-Cold War time. So, regionalism is closely related with relationship between

core and periphery also. Therefore, regional security complex theory (RSCT) may be convenient for analyzing security problems of the today's world.

The meaning of the region in this theory is that the region is the integrated area which has economic, geographic, social, and cultural similarity and is challenged by same security problem. The meaning of the Regional Security Complex (RSC) is also "*as a group of state whose primary security concern link together sufficiently closely that their national security cannot reasonable considered apart from another*" according to Buzan (2003, p. 40).

The impact of the geographical proximity on security interaction is strongest and most obvious in military, political and societal, and environmental sectors. Generally geographic adjacency is much less effective in economic sector when compared with security interaction. So, all the states in the system are enmeshed in a global web of security interdependency. But because regional security often associated with proximity, this interdependence is far from uniform. Buzan and Waver (2003, p. 46) claims that security interdependency is markedly more intense between the states inside such as complex than outside states. But great powers and superpowers are extending their interest and interaction over many complexes also. Great power will typically penetrate several adjacent regions, while superpower will range over the whole planet.

Some other states which have limited capacity confine their security interest and activities to their near neighbors. Smaller states will usually find themselves locked into and RSC with their neighbors (Buzan and Waver 2003, p. 46). So, regional security complex and their problems strictly bind to condition of the powers.

The question is here in this point that how regional security in geographical clusters can be enhanced.

Some of the basic assumptions of this study are as follows: first, history shows us minimal relationship with other states causes more threat perception; second, regional security highly depends on regional collaboration; third, geographic proximity is more functional in insecurity than the economic relation, so economic cooperation works in regional clusters but does not prevent proxy wars.

If we summarize regional security complex approach before analyzing of Middle East region, main corners of the RSCT are:

(a) International system manifests themselves in regional clusters.
(b) The role of the states varies in regional clusters.
(c) All the states in the system are to some extent enmeshed in a global web of security interdependence.
(d) Security also varies in the regions by effect of penetrating external power.
(e) Insecurity is often associated with proximity.
(f) Generally geographic adjacency is much less effective in economic sector when compared with security interaction.

## Regional Complex Theory and Middle East Region

The Middle East is a place where an autonomous regional level of security has operated strongly for several decades despite continuous and heavy impositions from the global level (Buzan and Waver 2003, p. 187).

The Middle East is a large and complicated place and it possesses some distinctive historical and cultural features. Most countries have been colonized by Westerners except Turkey, Iran, and Saudi Arabia. All countries are traditionally linked by trade and religion to each other all long history. Turkey and Afghanistan are insulator countries between the Middle East region, Europe, and South Asia. Turkey has special importance because it had ruled much of Arab world as the heartland of the Ottoman Empire.

There has not been any security problem or sectarian conflict in the Middle East region during the Ottoman time because of the strict control over the religious group or local authorities on behalf of the Caliphate. Actually there is no any spiritual authority in Islam ontologically, as it is pope or Vatican. Nevertheless, the caliphate has always

been an important both political and religious figure in Islamic world.

Post-Ottoman time, after the First World War, all Arab countries are colonized. Only Turkey, Iran, and Saudi Arabia have been independent between Islamic countries. But they were also under the heavy Western influence.

All Arab countries have gained their independence after the Second World War by inducement of Arab nationalism. But Arabism and Islamism are competitive as well as closely interlinked ideas (Dawisha 2000, p. 80).

As Barnett (1998, cited by Buzan and Waver 2003, p. 190) has demonstrated, the construction of Arab nationalism has generated considerably more inter-Arab rivalry and conflict than cooperation and harmony. This rivalry extended to such water, border, and clan interest problems also. So, many of the present dynamics of conflict of the region have roots reaching back into the interwar years.

From another point of view, colonization and decolonization have corrupted traditional sociopolitical structure of Arab countries and left them in an unstable condition after the independence.

At the end of the Second World War, British and French colonial presence was also strong, and their military-political overlay dominated the region for a long time. Rising of the nationalism, Israel and Palestinians question; oil reserves and resisting of conservatism are main roots of the conflicts. So, main conflict patterns in the Middle East region are consisting of:

(a) Inter-Arab rivalries between Hashemite and Saudi monarchies.
(b) Rivalry of the Arab leadership between Egypt and Iraq.
(c) Conflict between Palestinians and Zionist immigrants.
(d) Territorial problems between new emerged countries.
(e) Eternal competition between Arab and Persian civilization.
(f) Penetrative interest of the powers outside of the region.

Clearly Middle East countries would not be transplanted successfully into the Western political system after the independence. And they grasped by authoritarian regime as they used to be in their tribal tradition. But this tradition has feed inter-Arab competition also for leadership of the Arab world. Additionally, territorial problems, tribal rivalry, and rising of radicalization which originated from Shi'ism and Salafi are main grounds of the regional insecurity in the Middle East. But this insecurity has inclination of metastasize to the other region because of all regions are close-knit to each other about security issues. So security in the Middle East means security for other regions also. In this point, the question is how security in the Middle East region can be provided.

## Security Community for Regional Security of the Middle East

Although Islam itself has strong transnational qualities, Islamists have been poor at building wide political coalitions either within or between states and good at fragmenting themselves into rival factions. This reality feeds many conflict and fundamentalism in the region.

The Gulf subcomplex formed after Britain's withdrawal from the area in 1971. It centered on a triangular rivalry among Iran, Iraq, and Gulf Arab states led by Saudi Arabia. There is also peripheral rivalry between Saudi Arabia and Yemen which has generated a lot of local wars and has in its time drawn wider Arab participation along rival royalist versus radical line (Buzan and Waver 2003, p. 191).

The 1979 Iran revolution added a sharp ideological elements to its rivalry with Saudi Arabia since both states claimed leadership of competing Islamic universalism of conflict easily. All states in Middle East region have dynamic interest for each other. For example, Syria has a problem with Israel but also with Iraq so took side against Iraq both Gulf wars in both of these rivalries Syria is an ally of Iran. Iraq and Syria are allies against Israel but otherwise have been hostile to each other; the Gulf Arabs play financial role against Israel by their funding of Islamic group also in domestic politics of the many Arab countries. Egypt although a central player in Arab-Israel conflict

is also prominent in the Gulf; it intervened extensively in Yemen during the 1960s, and during the Second Gulf War sided with the Gulf Arab states and Syria against Iraq (Buzan and Waver 2003, p. 193).

Another rivalry problem of the Middle East region is waging competition and enmity between Shi'ism and Wahhabism (Salafi). Their radical conception about state and international relation is not only feeds mutual contestation but also spark an antagonism both non-Muslim and other Muslims also. Because Wahhabism and Shi'a both have radical ideas about Islamic state and governing. Wahhabism is a peculiar virulent, ultra-puritanical strain, so it tends to accept as profane most moderate Muslims. Shi'a also refused to right of governance of anybody who doesn't come from a prophet family. So they become not only political barrier to create central authority but also sources of radical Islamism. So, according to the Country Reports on Terrorism 2012 by the Bureau of Counterterrorism, there are 51 terrorist organizations, and 34 of them are originated from "Islamism" ("Country reports. . ." 2013). These "Islamist" terror organizations are originated from either Shi'ism or Wahhabism. Terrorist incidents are highest rank in the Middle East regions also (GDT 2013). It means that the Middle East region is one of the most insecure places of the world today.

It's crystal clear that security of all nations and countries in the Middle East region is tightly knit interregionally. But, almost every country in the Middle East perceived threat from neighbors as a threat and prefers being ally with countries from other regions, whereas the regional security highly depends on the regional collaboration and trade. On the contrary, regional security problems require internal cooperation and solidarity.

Origins of the concept of security community depend on the regional cooperation. It can be amalgamated model or pluralistic security model. An amalgamated security community exists with formal merger of the two or more previously independent units with some type of common government. But in pluralistic security community model, each unit retains in their legal independence and spare governance (Adler and Barnett 2000, p. 6). Amalgamation model like the USA is not possible for the Middle East region, but pluralistic model depends on the compatibility of core values derived from common institutions and mutual responsiveness.

In Deutschian model, communication is the cement of social groups in general and political communities. Actually history shows us minimal relationship and communication with other states causes more threat perception. So, communication will enable to develop a "we" sense and think together. According to Adler and Barnnet (2000, p. 7), transactions and communication would be factories of shared identification also. So pluralistic security approaches would fill the gap between different sects in the Middle East region in timely.

Adler and Barnnet convey about trade, migration, tourism, and cultural and educational exchange in transaction process. Additionally, the Hajj (pilgrimage) is strong transaction in Islamic world because it's weave social fabric between not only elites but also masses.

## Creating of Regional Security Structure in the Middle East

A community is defined by three characteristics (Adler and Barnett 2000, p. 6): (1) members of a community have shared identity, values, and meanings; (2) those in community have many sided and direct relation; (3) and communities have altruism. These are constructivist element of the community structure. But this structure needs an architecture and institution for cooperation in regional security. So general trend international organizations have condensation nuclei such as EU, ASEAN, OSCE, etc. for regional solidarity. These organizations reduce transaction cost and change the payoff structure of security arrangement by lengthening the shadow of future (Heller 2003, p. 125).

Main pillars of this structure are cognitive familiarity, common identity, and common idea. In European Union experience, cognitive familiarity is "democratic peace" doctrine. This is obvious factor in the Western European system of structures established after World War II. Second, common identity depends on Western civilization. And finally common idea of EU is economic cooperation for progress.

In the Middle East case, the Organization of Islamic Cooperation (OIC) is an institution for regional security structure. There are some other organization such as Gulf Cooperation and OPEC in region, but they are not including all countries in the region. But OIC is big umbrella for Islamic world as well as the Middle East region.

Second, cognitive familiarity is the concept of justice (adalet). Justice is one of the four fundamentals of Quran. It is the Muslim's duty to work for justice and reject operation on both interpersonal and structural level. The ideal and comprehensive notion of justice can facilitate the development of Islamic peace-building strategy (Abu-Nimer 2003, p. 51). So concept of the justice (adalet) in Islamic world can work as "democratic peace" theory.

Common identity for Middle East countries is that shared past and idea of transnational solidarity (the umma). This gave authentic and satisfying Islamic identity. But this idea doesn't require single transnational Islam or amalgamated security community. Pluralistic security community is compatible with realities of region. But even in pluralistic model, there must be some core countries for gravity center while creating regional collaboration as being Germany, France, and England in European Union. In the Middle East regional security structure, these core countries are Turkey, Iran, Egypt, and Saudi Arabia because prominent nations of region are Turks, Arabs, and Persians. But Turkey has some advantage over others because of being successor of the Ottoman Empire.

But abolition of the caliphate has negative effect on the relationship between Turkey and other Islamic countries at the beginning. In aspect of Turkey's sustainable relationship with Islamic world, it has accepted as threat for ideal Westernization. This is discourse of the securitization of relationship with Islamic countries for Turkey.

## Turkey, Model Country for Developing Regional Cooperation

Turkey is one of the pivot countries of Middle East region. The others are Iran and Egypt. Turks, Arabs, and Persians are dominant nation of the regions. So it cannot be possible to make something in this region without considering these nations. All Arabic countries have been ruled by Turk for a long time. Turks have been respectful for all Arabs because of the Prophet Muhammad (PBUH) who was also Arab. So, the relationship between Arabs and Turks has not been such as boss-labor relation. Turks always give them autonomy. This relationship demolished after the First World War, and all Arab countries separated from Empire by military force. Secular policy of the new republic of Turkey and rising of the socialist Arab nationalism also have been so harmful for this relationship. Turkey is Western country relatively with Middle East and has been in Western camp during Cold War time. But many Arab countries have been positioned themselves between non-alignment countries. But at the same time Arab countries prefer to be nearer to the Soviets than to the West because of the colonisation past. Therefore the relationship between Turkey and Arab neighbours has been always weak. But, history shows that minimal relationship between neighbours means more threat perception and misunderstands. So, regional security highly depends on the intra regional collaboration and trade. But, regional collaboration and confidence very complicated issue and itâ€™s generally requires leading and some initiations as it has been in European Union. In this point, rising of Turkey as a political and economic power in the region aroused a hope for successful cooperation in the region. It is also important that it was done by a conservative party because of demography of Middle East countries. So success of the Turkish government has been hope for all conservative dissidents. Thus some autocratic governments have been changed or toppled by people, and power of the conservatives has been raised in Arab Spring.

These changes bring the hope regional cooperation with a few exceptions. But future of the region is not clear already. At this point we are interested in desecuritization of mutual relationship. So Turkey experiences are both important externally and internally.

## Securitization and Desecuritization of Relationship Between Turkey and Islamic Countries in the Middle East

The relationship between West and Ottoman Empire has been shaped by "advancement strategy" and "defense strategy." Ottomans have taken the protector role for Islam and other oppressed nations in period of progress so it's called advancement strategy. But Ottoman's forced to give up this strategy gradually because of decline of Empire after the end of the seventeenth century.

Ottoman Empire has been terminated by nationalist at the end of First World War after the three-year independence war. Foreign policy of the new republic of Turkey has been shaped by historically inherited reflects and conjectural difficulties in international area (Davutoğlu 2001, p. 69) and vision of Westernization which is accepted as contemporary civilization.

Islamism and Turkism which have been used as foreign policy instruments are lost its importance at the twentieth century already. So, new republic determined present boundaries' ultimate goal as to protection of the national boundaries, and founders of republics think that it's possible only being in dominant Western power. Because of this inference, Turkey has become a part of new international system, whereas it was an alternative to the Western dominance in the past (Davutoğlu 2001, p. 69). It was impossible for any alternative in powerless position already.

## New Foreign Policy, Securitization of Foreign Policy

Becoming part of the Western-dominated system does not mean being in Western system for Turkey, because Turkey is in the region geographically which has political interest of Western power concentrated. The Middle East is not only a struggle arena of Western power but hinterland of Turkey also. Ottoman Empire has been the defender and representative of Eastern civilization against West for a long time, and Turkey is the successor of Ottoman Empire now. Hence, Westerners hesitated about Turkey because of this historically heritage. Especially the caliphate which becomes the main motivator and interdependency in Islamic World is existent already and religious character of society still evident. So Westerners think that being in Western-dominated international system is not enough to rely on Turkey. And they left a private distance for Turkey and waited for cultural and institutional transforming. This is a common base for Westerners and new Turkish elites; because Turkey's new elites needed a new vision to strengthen their position also. So, interest of Turkish elites and dominant power overlapped in this point.

In subsequent years, the caliphate has been invalidated after the declaration of new republic in construction of new reality. It was followed by new revolution like secularization of law and whole system. In this way Turkey assured to stay in "system" by takeout disturbing institutions and political identity for West. Hereafter geopolitical frontline of Turkey is legal boundaries. Therefore, Turkey doesn't have interest in some problems and changes of remainder of Ottoman lands like Balkans, Caucasians, the Middle East, and North Africa. Turkey foreign policy was neutrality, neglect, and ignorance about Eastern World (Gözen 2009, p. 36).

These changes have caused negative reflection on the Islamic World about Turkey. First, these changes are perceived as rupture from Islamic identity and civilization. Second, political and military intervention to the Hatay question in 1939 and northern Iraq problem have been criticized by the Arab world in shade of Arab nationalism. Third is ambivalent altitude for the Middle East in Turkish foreign policy as it's happened in recognition of Israel and negative attitude vote with France for Algerian independence. Forth is consistent foreign policy with US's interest in the region. Especially position of Turkey excoriate by Syria, Iraq, and Lebanon around 1947 and 1960.

Shortly the period of 1925 and 1960 was absolute pro-Western foreign policy of Turkey. So, the relationship between Turkey and Middle Eastern countries has been securitized by discourse of Westernization. Securitizing actors were secular state and elites. Referent object was national sovereignty and secularism; existential threats for referent objects were re-conservatism.

### Deviation from Absolute Pro-Western Policy of Turkey

Some significant development in international area has caused to review absolute pro-Western policy of Turkey. First and one of the most impacted ones is Cuban Missile Crisis in the 1960s.

Missile crises between the USA and USSR caused great danger for Turkey, but it solved without any information and evaluation from Turkey. Turkey realized that West easily could jeopardize him.

Second impacted one was Cyprus crises. Turkey perceived as national problem Cyprus question and needs for international support. Nevertheless Turkey couldn't find enough support by neither Western countries nor Eastern countries in this case. Therefore, Turkey realized that the West doesn't stand behind them when Turkey need them (Gözen 2009, p. 182).

Third one is Arab-Israel War. Turkey decided to give passive support for Arab countries in this time (Bölükbaşı 1999, p. 26). Turkey have had small advantage of this policy during oil crisis around 1973 and 1974. The only concrete benefit for Turkey was oil pipeline between Iraq and Turkey. But Turkey didn't so take advantage of this relation for a long time because of political and economical instability (Gözen 2009, p. 184).

The USA embargoed for Turkey after the military intervention to Cyprus. And some economic problems between Turkey and Europe have aroused idea of searching alternative in foreign policy. In this period Prime Minister Bulent Ecevit and Co-deputy Necmettin Erbakan were important political figure for desecuritization process of Turkey's foreign policy about the Middle East (Gözen 2009, p. 185). Bulent Ecevit was seeking cooperation about military and security issue in the regional context, while Necmettin Erbakan was seeking for economic cooperation such as "Islamic economic cooperation" between region countries.

Other important events are Iran revolution and Iran-Iraq War. Both countries relied on Turkey for their economic needs and reliable mediator. So, Iran-Iraq War has caused rising of external trade and cooperation in the region around the 1980s (Calabrese 1994, p. 103).

After the 1980s, Prime Minister Turgut Ozal has widened vision of Turkey both in West and East direction. He has both Ecevit and Erbakan vision about the Middle East. He wants it to be an active country in the region and become a regional power. Therefore he supported to the USA in First Gulf War. It was such a rebirth of absolute pro-Western policy of Turkey. But this time Turkey tried to develop relationship with other regional countries also.

Rising of the Kurdish question and new conjecture post-Cold War time caused fluctuation of regional policy of Turkey. Neoliberal transformation and its economic requirements have suppressed being more dynamic in foreign policy.

This period stagnation and horizontal expansion period of the Turkish foreign policy. Hence, President Ozal tried to diversify and expand interest area of Turkey by developing of relationship with old Soviet Union affiliated Turkish countries in Central Asia, but internal and international conjoncture did not allow to the great change to happen like this.

Most remarkable thing in these periods was that Turkey has always tried to keep warm relationship with West even seeking independence about foreign policy (Erhan 2006, pp. 390–391). So Turkey has been always criticized about being pro-Westerner both internally and externally.

### Desecuritization of Relationship Between Turkey and Islamic World

Actually seeking of proactive foreign policy has just begun after the Cold War time. Some initiatives were salient in terms of Turgut Ozal. But proactive policy has taken step in time of AKP (Justice and Development Party) after 2002. AKP government has benefited from all past experience about the Middle East and West. So silent future of foreign policy of AKP government is multidimensional foreign policy. Important subjects were:

(a) Sustainable development via economic cooperation with all countries.
(b) Sustainable security via regional cooperation with all neighbors.
(c) Diversified international trade.
(d) Forward-deployed diplomacy by using historical gravity.

These political initiatives have started with negotiations in regional dispute, for example, between Iran and West, Israel and Syria, Iran and Saudi Arabia, Lebanon and Israel, etc. Turkey thinks that inner peace is necessary to be strong in foreign policy. So some democratization program has been accepted by the government to deal with Kurdish question and reduce structural violence.

Opposition parties claimed that Turkey has diverted his face from West to the East, but most actually igniter initiatives about membership of the EU have been taken by AKP government also.

Most important change about state policy is that Turkey begins to benefit from Islam as a historical and moral motivation source for foreign policy instead of perceiving it as a threat for secularism. It helps to create friendly and more realistic foreign policy with Middle Eastern countries. This is desecuritization of the relationship with other Islamic countries in the Middle East. These developments were not unilateral. Turkey has gained great popularity in the Middle East public because of some declarations about Palestinian/Israel question and negotiation initiative in regional conflicts. Additionally economic achievement and political stability take Turkey in front of the line in international arena so Turkey came to be seen as a model. Turkey was one of the least affected countries about global financial crisis and most democratic ones between Islamic countries.

Conciliatory public speech about Islam and secularism which had been done by Prime Minister R.T. Erdogan in the University of Cairo was reassured for Islamic extremism. These improvements have positively reflected on the economic and politic relationship between Turkey and other Islamic countries. All indicators were positively raised. This development caused to discuss Turkey as a model for all Muslim countries.

## Conclusion

Prominent concern of today's world is security problems. Globalization and high technology have multiplier effect on the security problems, and all problems are metastasized easily. So, nobody can feel safe because of being far away from problematic area.

Additionally any problem in security area has more destructive effect today also. It means that many terrorist attacks have not been carried out in a military and conventional manner. In contrary attackers used daily life's tools. So this reality has dragged all of us to the security dilemma. We should make a choice between privacy, freedoms, and security. Hence security problems must be dealt with new methods. And we should develop new paradigm in international security also. One of the most logical methods is of course to prevent problems in their sources. This is core value of regional security complex theory (RSCT).

RSCT requires to strengthen regional cooperation because similarity, complexity, and proximity. The meaning of the region in this theory is that the region is the integrated area which has economic, geographic, social, and cultural similarity and is challenged by the same security problem. The meaning of the regional security complex (RSC) is also "*as a group of state whose primary security concern link together sufficiently close that their national security cannot be reasonably considered apart from another*."

Generally geographic adjacency is much less effective in economic sector when compared with security interaction. So, all states in the system are enmeshed in a global web of security interdependency. But because regional security is often associated with proximity, this interdependence is far from being uniform. Barry Buzan says that security interdependency is markedly more intense among states which are inside in complex than which are outside. But great powers and superpowers extend their interest and interaction over many complexes also. Great powers will typically penetrate several adjacent regions, while superpowers will range over the whole planet.

Some other states which have limited capacity confine their security interest and activities to their near neighbors. Smaller states will usually find themselves locked into and RSC with their neighbors (Buzan and Waver 2003, p. 46). So, regional security complex and their problems strictly bind to condition of the powers.

The question in this point is how regional security in geographical clusters can be enhanced.

Some of the basic assumptions of this study are as follows: first, history shows us that minimal relationship with other states causes more threat perception; second, regional security highly depends on regional collaboration. Third, geographic proximity is more functional in insecurity than the economic relation so economic cooperation works in regional clusters but does not prevent proxy wars.

There are many problematic areas in the world. One of them or one of the most important ones is the Middle East region. Because the Middle East is the most unstable region of the world today, this provides a safe haven to the extremists or terrorist organizations.

The question is here how to re-stabilize Middle East would again. Before giving answer to this question, we should have some reflection about the Middle East.

The Middle East is a large and complicated place and possesses some distinctive historical and cultural features. Most countries were colonized by Westerners except for Turkey, Iran, and Saudi Arabia. All countries have been traditionally linked by trade and religion to each other for a long history in the region. Turkey and Afghanistan are insulator countries among the Middle East, Europe, and South Asia. Additionally Turkey has special importance because of its ruling of Arab countries as the heartland of the Ottoman Empire for a long time.

All Arab countries gained their independence by inducement of Arab nationalism after the Second World War. But Arabism and Islamism are competitive as well as closely interlinked ideas. The construction of Arab nationalism has generated considerably more inter-Arab rivalry and conflict than cooperation and harmony. This rivalry includes water, border, and clan interest problems also. So, many of the present dynamics of conflict of the region have roots which reaches back into the interwar years.

From another point of view, colonization and decolonization have destroyed traditional socio-political structure of Arab countries and left them in an unstable condition after the independence. We can add more subject, but the main problems which are related with regional security are:

(a) Rising of extremism and rivalry between religious sects.
(b) Lack of regional cooperation, dialog, and solidarity because of the threat perception and others problems.

In this point it should be remembered that the Middle East has not been an unstable place in the near history. Actually there were no waging security problems in the Middle East at the time of the Ottoman Empire. Therefore, the Ottoman Empire has been a kind of "security community" by covering most Islamic countries in the Middle East region for a long time. So it can be said that the Ottoman Empire has achieved Karl W. Deutsch's economic-orientated "security community" model in the context of political scene also.

But at the post-empire time, mutual relationship has been low level between regional countries. Especially Turks, prominent successor of the Ottomans have turned their face to the West and have been refrained from developing close relationship with the other Islamic Countries in shake of Westernization. This is the securitization of international relationship between Turkey and other Islamic countries. The other states also have securitized foreign policies with neighbors because of the geostrategic and politic disputes. So the Middle East has been far away from regional integration and cooperation among countries.

Today many countries perceive threats from others in the Middle East. If so it is crucially important to desecuritize of foreign policies for building a regional security complex in the Middle East. In this point, experience of Turkey about new foreign policy may be a good model for readvance relationship amongs regional countries.

So most salient future of new foreign policy of Turkey is multidimensional. Important subjects were:

(a) Sustainable development via economic cooperation with all countries.

(b) Sustainable security via regional cooperation with all neighbors.
(c) Diversified international trade.
(d) Forward-deployed diplomacy by using of historical gravity.

These are parallel with regional complex theory also. But most important barriers for regional cooperation in the Middle East are autocratic governments in the region. Turkey proves that democracy and secularism might be compatible with Islam. But of course no authoritarian regime will easily accept to transform itself to democratic one. In this point external power may destroy all images and initiatives. This transformation must be internally induced, and reliable power is the power of people. Turkey may be only brilliant image for metamorphose.

As a result, regional security complex theory draws a good framework for solving of security issues of the Middle East. The Middle East region needs a functional regional cooperation for being stable area. This functional regional cooperation could be a solution for not only political and economic problems but also for religious extremism. So there must be some dragger countries for this functional cooperation, and Turkey is eligible for the Middle East because of its historical gravity. And Turkey may be good model for all Muslim countries because of its experiences about desecuritization of the relationship in the Middle East region.

# Design and Implementation of Legislation: The Role of Discretion

Barbara Coyle McCabe[1] and Renee Nank[2]
[1]University of Texas at San Antonio, San Antonio, TX, USA
[2]University of Texas Rio Grande Valley, Edinburg, TX, USA

## Synonyms

An administrator's latitude in policy implementation

## Definition

Administrative discretion is the freedom that unelected public servants have to make decisions about the application and implementation of public policy. Administrative discretion includes the

ability to decide which policies to focus on as well as the determination of the kind, quality, and quantity of benefits or sanctions to apply.

## Introduction

Administrative agencies carry out the dictates of the laws and rules that express public policy. Laws and rules do not implement themselves, and no matter how precise they may be, laws and rules cannot anticipate every possible circumstance that reality presents. Ultimately, the interpretation and implementation of public policy is left to bureaucrats/public servants, who must resolve the real-life issues that clients face and public policy seeks to address. This resolution requires public servants to exercise administrative discretion. Administrative discretion takes many forms and occurs at virtually all levels of an administrative agency. It is so central to the realization of public policy that administrative discretion lies at the heart of administrative law. Administrative discretion, however, remains controversial for at least two reasons. First, administrative discretion means that policy is shaped by an unelected cadre of public employees. Perhaps for this reason, much of the political science literature has focused on differences in legislative grants of discretion to public agencies and on how political actors can direct bureaucratic discretion. Second, while discretion enables public servants to tailor their actions to fit the circumstances, it also makes it possible for public officials to discriminate and behave abusively. Much of the public administration literature considers the conditions under which discretion is practiced and the characteristics that shape its practice.

## Discretion at Work

Since laws tend to be more general than specific, administrative discretion includes both agency rulemaking and implementation actions. In state and federal governments, statutes typically give regulatory and service agencies broad policy mandates, and agencies then adopt administrative rules that provide greater detail for how those mandates will be met. In this way, administrative rules structure administrative discretion. Even with rules in place, public officials exercise discretion in many ways and at all levels of the agency, top, middle, and bottom.

Discretion comes into play when agency heads use their judgment to determine how to carry out vague or inconsistent policy mandates. It allows administrators to select from alternatives and determine how a public policy will be carried out in a specific case. For example, an agency executive may develop a strategic plan that places more emphasis on attaining some policy goals and less focus on others. Discretion also allows bureaucrats/public servants to use their expertise to fill in the knowledge gaps of legislation. For example, to combat seasonal influenza, public health officials use surveillance data and forecasts about the spread of various strains of viruses across the world in order to determine which virus strains should be included in the flu vaccine for that year. Finally, discretion allows a public servant to adapt a program or procedure to fit the client's needs instead of blindly following a one-size-fits-all approach. When teaching young children to read, for example, a teacher may tutor a single student having difficulties with an assignment while the rest of the class reads independently. In this sense, administrative discretion makes public policy real and meaningful to the client.

## The Political Science Perspective

Lawmakers address administrative discretion of both *ex ante*, in the design of legislation, and *ex post*, in the oversight of administrative agencies. Some scholars note that legislation can be designed to "stack the deck" in favor of preferred policy outcomes, and such deck stacking limits the need to rely on administrators' judgments. For example, the laws' provisions for the burden of proof stacks the deck against pharmaceutical companies attaining approval for a new drug as well as against the Environmental Protection Agency's (EPA) regulating chemicals: Drug companies

must demonstrate that a new drug is both safe and effective to win regulatory approval, but the EPA must prove a chemical harms human life or the environment for that chemical to be regulated. As a result, few new drugs are approved and few chemicals are regulated. In designing legislation, lawmakers can include provisions affecting the administrative rulemaking process or the composition of administrative boards to shape the law's implementation and favor predetermined outcomes, stacking the deck to favor some interests and hinder others (McNollgast 1999).

Many scholars in political science examine administrative discretion through the lens of economics (particularly the economics of insurance) to develop theoretically-driven mathematical models that explain or predict bureaucratic responses to congressional grants of authority. Many of these models formalize the relationship between lawmakers and bureaucrats as a principal-agent problem, a relationship in which one party (the principal) empowers another (the agent) to act on their behalf. In an ideal relationship, the agent acts efficiently and effectively to carry out the principal's tasks, but economic models assume both agents and principals are rational, self-interested actors. The principal-agent problem arises because the interests of principals and agents may differ: unfaithful agents may shirk their duties or pursue their own agendas at the principals' expense. Information asymmetry – in which the agents know more about the policy and its implementation than the principals do – is a related problem that formal models of bureaucratic discretion frequently address.

## Principals, Agents, and Policy

Policy implementation is rife with principal agent and information asymmetry problems. The very notion of bureaucratic expertise – whether in substantive areas or procedural matters – highlights the information advantages of bureaucrats. Formal models have demonstrated that administrative discretion is not a dichotomous issue, but a matter of degree. They have shown that it is not possible to implement policy without at least a small measure of administrative discretion and also have identified conditions under which lawmakers to grant agencies greater measures of discretion (Epstein and O'Halloran 1999). Generally, lawmakers are apt to grant more administrative discretion in areas that are technically complex or inherently unstable, and less in areas in which they feel competent to set direction. Laws governing responses to emergencies or disasters tend to give agencies considerable discretion for how they will respond, for example. Agencies, on the other hand, may desire less discretion when the issues involved are highly salient and garner a great deal of interest but where the outcomes of the policy choice are uncertain. In short, formal models examining *ex ante* measures for bureaucratic control have shown that it is neither possible nor practical for lawmakers to design away administrative discretion.

One way to address the principal-agent problem is to monitor the agents' behavior, but such oversight is costly. Furthermore, monitoring often focuses on inputs, but effective monitoring of agencies would concentrate on outcomes. For members of congress, an agency's key outcome is whether their constituents are getting the services they want from agencies. The use of formal models examining *ex post* measures for limiting agency discretion led scholars to examine congressional oversight, an important function that many felt congress had abandoned. Congressional oversight helps assure that elected representatives and administrative agencies generally agree about agency purposes and practices, but oversight activities tend to be spotty. Rather than uniformly reviewing the actions of all federal agencies, members of congress pay particular attention to the programs or agencies they believe are somehow failing congressional constituents.

Critics had long argued that Congress treated agency oversight in an ad hoc, lackadaisical fashion. Models of the oversight function revealed that congress' approach to monitoring agency behavior stood on solid, rational ground. Just as a fire alarm signals, a need for action, mistakes, or poor outcomes in policy implementation raise a call for legislative oversight, as elected officials review agency actions (McCubbins and Schwartz

1984). Many congressional actions – reviewing budgets, holding hearings, approving executive appointments – can be used to rein in administrative discretion and shape future decisions. In short, legislative efforts to attenuate administrative discretion can come both before implementation by changing a broad grant of power to a narrow, highly specific one as well as after implementation, through heightened legislative oversight, tightened budgetary controls, or increased scrutiny over the appointments of agency heads.

Economic reasoning, formal models, and principal-agent theory simplified relationships between administrative and congressional actors to the point that differences among institutional mechanisms could be explained and predicted. The economic foundation lent these models several strengths, including a rational microfoundation for the individual behavior of bureaucrats and lawmakers, the use of deductive reasoning, and the need for sophisticated methodologies, that drew scholars' interests. Moving beyond the stark principal-agent model of congressional-administrative relationships to a more realistic depiction of the politics of policy implementation recognizes that federal bureaucrats respond to multiple principals – congress, the executive, the courts, and interest groups – with differing perspectives. Beyond that, many bureaucrats are trained in professions and members of professional organizations that have their own codes of ethical behavior. The recognition of multiple principles and influences greatly complicates these models of bureaucratic behavior and reduces their predictive power.

## The Public Administration Perspective

The classic Weberian (1978) bureaucracy focused on the efficient execution of duty: elected officials set programmatic goals which administrators carried out. In "Politics as Vocation," Weber (1965) declared that elected officials, not administrators, are to be responsible for public policy and are to be held responsible through the political process. Bureaucrats are to use their professional expertise and follow the laws and rules to implement these programs, giving rise to the classic politics/administration dichotomy of Woodrow Wilson (1887). The notion of administrative discretion was not a carefully developed construct. In his famous essay, Wilson called for "unhampered discretion," presumably relying on bureaucratic expertise, technical competence, and the hierarchical controls of public agencies. This position was revised as Wilson campaigned for the presidency in 1912 when he advocated in favor of greater legislative specificity, and administrative responses to well-defined laws (Cook 2002).

As government assumed new roles in the Great Depression, divergent perspectives of bureaucratic responsibility, accountability, and administrative discretion were voiced. The debate between Carl Friedrich (1935, 1940) and Herman Finer (1936, 1940) explored the normative dimensions of public service as it established polar positions on the proper scope of bureaucratic action. Finer argued in favor of the classic dichotomy, contending that bureaucrats are accountable to elected officials, whose directives should include policy goals as well as the means for their achievement. Part of the elected official's job, according to Finer, was the supervision of bureaucrats' implementation of policy. In his view, discretion was the politicians' prerogative. Friedrich, on the other hand, emphasized the complex interactions among policies and the technical aspects of their implementation. He saw public policy making as an ongoing process, evolving at the hands of administrators as they carry out policy directives. Friedrich's work drew on ideas of professionalism and the development of expertise through training, education, and interaction with other professionals. In his view, good policy results arise not from the simple following of directives, but from the bureaucrat's efforts to be responsive to the public good and responsible to elected officials. To Friedrich, discretion enabled public servants to use their expertise for the public good and to be held accountable for their actions. Taken together, the Friedrich-Finer debate highlights two sides of bureaucratic responsibility – the political as well as the professional.

## Street-Level Bureaucracy

To Lipsky (1980), policies are best understood not by studying the way they are enacted by elected officials, but by examining the way they are carried out through the actions of street-level bureaucrats. Street-level bureaucrats (Lipsky 1980) handle individual transactions between citizens and public agencies and, despite their place on the lower rungs of the public agency's hierarchy, make the decisions and take the actions that implement public policy. In that process, they exercise considerable administrative discretion. Acting in the name of the agency, street-level bureaucrats – police officers, teachers, health and safety inspectors, intake officers, etc. – assign the benefits and impose the sanctions that actualize public policy. Decisions to issue a ticket, assign a grade to homework, set the amount of a fine, confer benefits, and perform the other decisive tasks that deliver public policy to citizens all lie within the purview of street level bureaucrats.

Essentially, Lipsky perceived street-level bureaucrats as using their discretion to make their jobs both more manageable and more interesting. Every day, these workers face clients in difficult circumstances and agency pressures to be effective and efficient. Many street-level workers succumb to the pressures and burn out. Turnover in these jobs is high. Those who remain develop individual routines to deal with the pressure of limited time, emotional cost, and uncertainty in making judgments about individual cases. A job counsellor, for example, may deal with the easy-to-place clients first, to satisfy agency demands for efficiency, and leave hard-to-place, long unemployed clients for last on their daily to-do lists. While the routines help simplify work life, they also shape decisions on the use of discretion. Besides individually-developed routines, street-level bureaucrats' decisions are also influenced by their coworkers, organizational culture, as well as by their personal and professional beliefs and norms. The perspective that street-level bureaucrats have of themselves, their work, and their clients is very different from the views of high-level policy makers.

High-level policy makers see the targets of policies (e.g., at-risk teenagers) as objective abstractions and the street-level bureaucrat as the implementation arm of the state. Street-level bureaucrats work directly with members of the public, and often define their work not in terms of policies and rules but in terms of their norms and beliefs about fairness as well as in terms of their relationships with their clients (Maynard-Moody and Musheno 2000). Unlike the objective observations of high-level policy makers, street-level bureaucrats are emotionally engaged, but the power positions of the bureaucrat and client is unequal because the bureaucrat has the authority to issue sanctions and benefits.

Faced with the need to make quick decisions, street-level bureaucrats assess their clients' situation and determine a response to it. One way in which street-level bureaucrats use their discretion is in the decision over how fervently to pursue their client's case and which rules to apply in its pursuit. In their study of cops, teachers, and counsellors, Maynard-Moody and Musheno (2003) found this decision was based on street-level bureaucrat's judgment of whether the client was just "working the system" or was truly worthy of assistance and extra effort. For those deemed deserving, street-level bureaucrats will sometimes risk breaking the rules to take actions in the interest of their client. The discretion of street-level bureaucrats can work to the client's benefit or detriment, and high-level policy makers sometimes seek to channel discretion by enacting procedures and policies that centralize decision making.

## Limiting Discretion at the Street Level

Information and communication technology has limited the discretion of street-level bureaucrats in some large, machine-like agencies, particularly for routine decisions involving program eligibility. In these agencies, systems analysts, software programmers, and policy analysts have designed knowledge management systems, decision trees, and algorithms to allow for computerized assessment of client information and program entitlement. Public employees that meet with clients use computerized templates to input client data, with the decision made by the system. Intake personnel

have lost administrative discretion in these agencies, but discretion has not so much been eliminated as transferred to the system designers (Bovens and Zouridis 2002).

Centralization and standardization also limit administrative discretion. When a state establishes the education curriculum or selects the textbooks that may be used in K-12 classes, the discretion of local elected officials has been limited. At the local level, some school boards not only establish the curricula for classes, but determine what will be taught, when, and how, limiting the discretion of teachers. Again, centralization and standardization, whether through technology or by decree, limit administrative discretion at the lower levels by interpreting policy and creating procedures that reflect the preferences of systems designers and higher-level policy makers.

## Conclusion

Administrative discretion is part of policy implementation in nearly every public program. It remains despite lawmakers' efforts to control it through legislative design and executives' employment of technology and other means to standardize and centralize decisions. While political science models frequently assumed that bureaucrats would use their discretion in their own self-interest, perhaps by shirking work or pursuing personal goals, Maynard-Moody and Musheno (2000, 2003) found that many bureaucrats at the street level use their discretion to dedicate themselves to meeting the needs of clients they believed in. In this way, many street-level bureaucrats use their discretion to make their jobs rewarding while making public policies work in the interests of the public. On the other hand, just as these bureaucrats can use their discretion for their clients' benefit, discretion can be used abusively, to the client's detriment.

# Destructive Technologies for Industrial and Corporate Change

Mario Coccia
CNR – National Research Council of Italy, Torino, Italy
Yale University, New Haven, CT, USA

## Synonyms

Competence destroying; Destructive creation; Discontinuous innovations; Disruptive innovations; Killer technologies; Major innovations; Radical innovation; Revolutionary innovations; Technology change; Technology progress

## Definition

Destructive technology is a radical innovation, (a new product and/or process) which with high technical and/or economic performance destroys the usage value of established techniques previously sold and used in markets, generating technological, industrial, economic, and social change.

## Introduction

Adner (2002, pp. 668–669) claims that:

> Disruptive technologies . . . introduce a different performance package from mainstream technologies and are inferior to mainstream technologies along the dimensions of performance that are most important to mainstream customers. As such, in their early development they only serve niche segments that value their non-standard performance attributes. Subsequently, further development raises the disruptive technology's performance on the focal mainstream attributes to a level sufficient to satisfy mainstream customers . . .. disruptive technologies . . . with their lower performance, appeal to the low end, low-profit portion of the mainstream market.

Calvano (2007) suggests the concept of "destructive creation," in which "a monopolist has the option, at the beginning of each period, to destroy the usage value of all units previously sold and simultaneously introduce a new, perhaps improved, vintage at some cost $c \geq 0$. . .Such cost is interpreted as any expenditure incurred in the process of destruction as well as in the process of creating, developing and marketing the new versions."

In general, turbulent markets have, more and more, destructive technologies given by radical innovations of new products and/or processes that with high technical and/or economic performance destroy the usage value of established techniques previously sold and used, generating technological, industrial, economic, and social change (cf., Coccia 2019a; Foster 1986; Sahal 1981; cf., Coccia 2018b, 2019c; Coccia and Watts 2020). Disruptive technology (as a complex system of interrelated components) can be analyzed with different theories that are schematically summarized in Fig. 1.

## Theories of Disruptive Technologies in Industrial Competition

### Theory of Revolutionary Innovations by Abernathy and Clark

This theoretical framework recognizes that innovation is not a unified phenomenon: some innovations disrupt, destroy, and make obsolete established competences; others refine and improve existing technologies. In particular, Abernathy and Clark (1985, pp. 4*ff* and pp. 12–13, original emphasis) claim: "An innovation is .. . . derived from advances in science, and its introduction makes existing knowledge in that application obsolete. It creates new markets, supports freshly articulated user needs in the new functions it offers, and in practice demands new channels of distribution and aftermarket support. In its wake it leaves obsolete firms, practices, and factors of production, while creating a new industry .. . . innovation that disrupts and renders established technical and production competence obsolete, yet is applied to existing markets and customers, is . . . labelled 'Revolutionary.' It thus seems clear that the power of an innovation to unleash Schumpeter's 'creative destruction' must be gauged by the extent to which it alters the parameters of competition, as well as by the shifts it causes in required technical competence. An innovation of the most unique and unduplicative sort will only have great significance for competition and the evolution of industry when effectively linked to market needs."

### Theory of Disruptive Technologies by Christensen

Christensen (1997) identifies disruptive technology with specific characteristics: (a) the performance trajectory provided by disruptive technology and (b) the performance trajectory demanded by mainstream market. Christensen et al. (2015) claim that disruptive technologies or innovations are generated by small firms with fewer resources that successfully challenge established incumbent businesses. Innovative firms, generating disruptive innovations, grow more rapidly than other ones (Tushman and Anderson 1986, p. 439; Abernathy and Clark

**Destructive Technologies for Industrial and Corporate Change, Fig. 1** Theories of disruptive technologies in industrial dynamics

1985). Christensen's (1997) approach also shows that disruptive innovations generate significant shifts in markets (cf., Henderson 2006). In general, technological and market shifts embody competence-destroying and competence-enhancing because some firms can either destroy or enhance competence existing in industries (cf., Hill and Rothaermel 2003; Tushman and Anderson 1986). New firms tend to generate competence-destroying discontinuities, based on disruptive technologies that increase the environmental turbulence, whereas incumbents focus mainly on competence-enhancing discontinuities that decrease the turbulence in markets. Disruptive innovations change habits of consumers and undermine the competences and complementary assets of existing producers (Christensen and Raynor 2003; Garud et al. 2015; Markides 2006; cf., Coccia 2005). Disruptive innovation speed is also important to sustain competitive advantage of firms amidst rapidly changing business environments (Kessler and Chakrabarti 1996, p. 1143). A sector with several disruptive innovations is biopharmaceutical industry because of revolution generated by molecular biology and nanotechnology (Coccia and Finardi 2012, 2013; Coccia 2012, 2014, 2015; Coccia et al. 2012; Coccia and Wang 2015). Christensen (1997) observes that established firms face an "innovator's dilemma," which is associated with the problem of internal resource allocation leading them to systematically underinvest in Research and Development (R&D) of disruptive technologies (cf., Garud et al. 2015; Coccia 2006). However, research alliances and acquisitions may help incumbents to overcome this *inertia* both in the initial stage of research and in the later stage of development of disruptive technologies (Coccia 2014, 2015). Coccia (2020) shows new disruptive technologies given by deep learning methods in cancer imaging that can generate a shift of technological paradigm for diagnostic assessment of any cancer type and disease.

## Theory of Competitive Substitution Between Technologies by Fisher and Pry

Disruptive technologies often supplant for more mature technologies in markets (Coccia 2019b). This dynamic behavior between technologies leads to the dominance of a new disruptive technology on established one in markets (cf., Coccia 2017). A model that operationalizes this competition between technologies is suggested by Fisher and Pry (1971). This model fits to data of competition between synthetic vs. natural fibers, synthetic vs. natural rubber, etc. (cf., Fisher and Pry 1971). In this context, Sahal (1981, p. 79*ff*) describes the competition between steamship and sailing ship that generates in the long run the dominance of steamship (a disruptive innovation) as means of transportation of goods and people (cf., Graham 1956; Rosenberg 1976). Another example of disruptive technology is the diffusion of Solvay process that in the 1900s destroys the Leblanc process in the production of soda (Freeman 1974). In agriculture, farm tractor can be considered a disruptive technology because it has generated a substitution of mechanical for animal power (Sahal 1981; Walker 1929). In general, disruptive technologies have the

characteristics of substitutes with a powerful force in markets that generates technical, industrial, and economic change (Porter 1980).

### Theory of Predator-Prey Relationship Between Technologies

The competition between technologies can generate a predator-prey relation (Pistorius and Utterback 1997, p. 74). In this case, (emerging) disruptive technology can slowly reduce market share of (mature) established technology. Farrell (1993) applies Lotka-Volterra equations to examine the predator-prey competition between technologies, such as between nylon *and* rayon tire cords, telephone *and* telegraph usage, etc. Utterback et al. (2019) show a predator-prey relation in a specific period between plywood and oriented strand board (OSB is a composite of oriented and layered strands, peeled from widely available smaller trees). The behavior of predator (disruptive) technologies is especially relevant to explain how a new technology destroys old technologies and generates corporate and industrial change (cf., Porter 1980).

### Theory of Killer Technologies and Speed of Creative Disruption by Coccia

Killer technology is a radical innovation, that with high technical and/or economic performance destroys established devices in markets. Killer technology *Kl* can explain the behavior and characteristics of innovations that generate a destructive creation for technical and industrial change. The relationship between a disruptive technology *Kl* (called killer technology) *and* a victim technology *V* (established technology) can be represented with a *log-log* linear model (Coccia 2019b):

$$\log Kl = \log A + B \log V \qquad (1)$$

*B* is the coefficient of growth that measures *how* technology *Kl* destroys technology *V*. This model has linear parameters that are estimated with the ordinary least squares method. In particular, the coefficient *B* in the model (1) measures the relative growth (*speed*) of *Kl* in relation to the growth of *V*, suggesting different patterns of creative disruption in markets:

- $B < 1$, whether new killer technology *Kl* destroys at a lower relative rate of change the old victim technology (*low speed of disruptive technology in markets*)
- $B = 1$, killer technology *Kl* substitutes victim technology at a proportional rate of change (*proportional speed of disruptive technology in markets*)
- $B > 1$, whether killer technology *Kl* destroys victim technology at greater relative rate of change (*high speed of disruptive technology in markets*)

Examples of killer technologies are into the market of devices for data storage, such as the development of Universal Serial Bus (USB) technology by Intel Corporation in 1995 to standardize the connection of computer peripherals (Coccia 2017, 2018a). In 1998, the Personal Computer iMac G3 by Apple Inc. was the first consumer computer to discontinue legacy ports (serial and parallel) in favor of USB technology (Coccia 2018a). This innovation strategy by Apple Inc., a market leader, has paved the way for a market of solely USB peripherals (*disruptive technology*) rather than other ports for storage devices. New USB technology in interaction with host technologies, such as Personal Computers, has destroyed the market of other storage devices because of more efficient operations of storage (higher velocity of transfer data, larger storage capacity of data, etc.; Coccia 2018a, b; 2019a, b; Coccia and Watts 2020). In short, USB technology, as killer technology, has destroyed the use of 3.5-inch floppy disks, Compact Disc, etc. generating industrial and corporate change (Coccia 2018a). Emerging cloud computing (based on computing services, such as servers, storage, databases, networking, etc. over the Internet "the cloud") is generating a further shift in these markets destroying other devices of data storage. Finally, general properties of killer technologies (Coccia 2019a, b) are (1) killer technology has a disproportionate growth in relation to victim technologies in markets; (2) killer technology has a series of major and minor technological advances of its own that pave the way for the dominance over other established technologies in markets; and

(3) learning via diffusion and diffusion by learning are a driving force underlying the development and adoption of killer technology in markets.

## Conclusions and Managerial Implications

Calvano (2007) argues that "we highlight the role of destruction rather than creation in driving innovative activity. The formal analysis shows that destructive creation unambiguously leads to higher profits whatever the innovation cost" (cf., Tripsas 1997). Christensen (1997) claims that "disruptive technologies" offers a novel mix of attributes compared to established technology (cf., Adner and Zemsky 2005; Christensen 2006). The disruptive technology is, therefore, initially purchased by consumers in a secondary (niche) market segment who place high value on new technology's attribute mix. As disruptive technology matures and improves its performance, it is able to enter into the primary (mainstream) segment. Christensen (1997) shows this dynamic behavior with a variety of technologies, including laser and inkjet printers, hydraulic, and steam-powered earthmoving equipment, etc.

Adner and Zemsky (2005) argue that the disruptive threat is greater when firms can price discriminate across market segments. In particular, disruption occurs when new-technology firms pursue a high-volume and low-price strategy that allows to break into the primary segment. For example, the lower the marginal costs of new-technology firms, the more attractive is a high-volume strategy and hence the greater the threat of disruption by new technology. Moreover, the lower the marginal costs of the established-technology firms, the greater their output and hence the lower the scope for new-technology firms to increase their volumes by disrupting the primary market. In short, the lower the costs of established-technology firms, the lower the threat of disruption. Despite disruption is associated with low costs for new technology, Adner and Zemsky (2005) claim that the lowest-cost new-technology firm is not necessarily the one that initiates disruption. Adner and Zemsky (2005) find that technology improvement can lead to disruption and highlight the importance of market structure as an important driver of the dynamics of disruption because it determines the extent to which consumer surplus from each technology increases over time (cf., Coccia 2016). Finally, Adner and Zemsky (2005) also show that a) social welfare can unambiguously increase because prices for both products (based on established and new technology) fall with disruption and that b) concentration tends to increase with disruption because the effect of cost asymmetries on market share is amplified by the increased number of competitors (cf., Coccia 2016).

The characteristics of disruptive technologies can be synthetized as follows (Coccia 2019a):

1. Disruptive technology is always associated with some comparable established technology in markets.
2. In the short run, disruptive technology can induce incremental technological advances of established technologies that have a prospect of being supplanted by a (new) disruptive technology.
3. In the long run, disruptive technology has a series of technological advances of its own resulting from various major and minor innovations that pave the *technological direction to be a dominant technology* over other established technologies in markets.
4. The long-run behavior and evolution of any disruptive technology is not independent of the behavior of other comparable technologies.
5. The *learning* via *diffusion* and *diffusion by learning* are a driving force underlying the development and adoption of disruptive technology in turbulent (complex and fast changing) markets.

Overall, then, disruptive technology is a specific radical innovation that generates a disruptive creation in industrial dynamics. Disruptive technology affects the behavior of other technologies, generating a process of actual substitution of a

new technique for the old one and, as a consequence, technical, industrial, and corporate change. The characteristics of disruptive creation can support innovation strategy of firms and policymakers of nations on critical decisions of when to invest in R&D of new disruptive technologies, abandon the old technology, or pursue an intermediate level of R&D investment between old and new technology for sustaining and safeguarding competitive advantage in turbulent markets (cf., Coccia 2018c, 2019d). To conclude, for scholars, disruptive technologies highlight the question of the boundaries of technology competition and how those boundaries change over time (Adner 2002). For managers, disruptive technologies highlight the danger posed to incumbent firms from too quickly dismissing new technologies as inferior and therefore irrelevant to their market positions.

# Determinants of Tax Compliance Attitude

Godfred Matthew Yaw Owusu, Rita Amoah Bekoe, Octavia Ama Serwaa Otchere and Nana Adwoa Anokye Effah
Department of Accounting, University of Ghana Business School, University of Ghana, Accra, Ghana

## Synonyms

Compliance; Conformity, abidance, obedience, adherence, observance; Levy, tariff, duty, tribute; Tax

## Definition

Tax compliance is the manner and extent to which individuals adhere to the applicable tax laws in their country of residence.

## Introduction

The socioeconomic development of every nation depends substantially on its capacity to generate enough revenue to finance its developmental projects. One of the major avenues for revenue generation for development is through taxation. Notwithstanding the fact that taxes constitute an important source of revenue to governments, it has been a huge challenge for many governments and tax authorities in practice to convince all individual taxpayers to meet their tax obligations to the state (McGee et al. 2008). Governments all over the world are confronted with the challenge of dealing with tax non-compliance issues which have been on the ascendency for decades. Despite the efforts by most governments in reforming the tax systems, available statistics on the amount of revenue lost to countries due to non-compliance with tax laws suggest widespread evasion of tax in many parts of the world.

A report by the Tax Justice Network suggests that governments worldwide lose more than $3.1 trillion in annual revenue due to tax evasion, while it is estimated the equivalent of more than 5.1% of global gross domestic product (GDP) never reaches the coffers of 145 national governments in the form of taxes (Cobham and Janský 2017). The United States alone loses over $600 billion revenue to tax evasion each year (Cebula and Feige 2012), while the European Union loses between €50 and €70 billion of tax revenue to tax evasion annually (Carrero and Seara 2016). In Africa, the continent loses close to $14 billion revenue to tax evasion annually (Mwanza 2016).

To reduce the incidence of tax evasion and enhance the revenue mobilization effort of countries, several initiatives including tax audits and enactment of laws to punish offenders among others have been experimented by many governments. These initiatives in most cases have focused on ensuring compulsory compliance with tax provisions. Notwithstanding its perceived benefits, measures aimed at enforcing compliance with tax provisions have been criticized for its minimal impact on taxpayers' compliance attitude. As argued by social psychologists, tax compliance can be achieved without the use of any form of force by tax officials. In line with this belief, Mohdali and Pope (2012) suggest the need to focus on sociopsychological factors in explaining tax compliance behavior on the basis that residents of the country feel obligated to do so and not for the fear of repercussions of non-compliance.

Accordingly, several studies seeking to understand the tax compliance behavior of individuals have emerged over the years (Wahl et al. 2010). These studies argue that factors such as tax knowledge, trust in authority, ethics, education, and social norms are relevant in explaining tax compliance behavior of individuals. Thus, a multiplicity of factors may explain the tax compliance behavior of individuals, and these factors may vary based on context.

By relying on the framework of Mohdali and Pope (2012), the current study examines the tax compliance attitude of a section of Ghanaians highlighting the dominant factors that influence tax compliance attitudes. The study examines whether the perception individuals have toward the government (in terms of utilization of tax revenue), the attitude of the tax authorities toward taxpayers, and other demographic characteristics of the respondents including their level of tax knowledge and religiosity have any implications on their tax compliance behavior. While the work of Mohdali and Pope (2012) was conducted in a Muslim-dominated environment, this study provides some evidence from a Christian-dominated country (Population and Housing Census 2010).

## Literature Review

### Tax Compliance and Theories of Compliance

"Questions about tax compliance are as old as taxes themselves and will remain an area of discovery as long as taxes exist" (Torgler 2006, p.82). While most researchers in the area of taxation view compliance as a measure of taxpayers' conformity to tax rules as well as regulations, others explain compliance to involve the filing of requisite tax returns at the right time, and accurately reporting one's tax liability in accordance with the applicable laws. Tax compliance as a

concept is therefore about individuals and how they adhere to the applicable tax laws in their country of residence.

Critical to the tax compliance discourse is the attitude of taxpayers toward paying taxes. Several studies have examined the factors that influence tax compliance behavior of people. Eriksen and Fallan (1996), for instance, argue that the tax compliance attitude of an individual is usually a function of that individual's knowledge of tax regulations and their economic effect and conclude that knowledge of tax laws reduces the propensity not to comply with tax provisions. Other factors including the perception of fairness in the use of tax revenue, social norms, education, ethical conduct, trust in tax authorities, personal characteristics of the individual taxpayer, etc. have been associated with tax compliance attitude. Studies have examined these factors under the lenses of the economic deterrence model, social psychological model, and the fiscal psychological model.

The economic deterrence theory is primarily based on the economic theory of compliance with a focus on deterrence be it persuasive or punitive. Its foundation is based on the measures aimed at preventing taxpayers from evading. The assumption is that taxpayers pay their taxes largely due to the fear of being detected and penalized for non-compliance. Thus, a rational taxpayer will evade tax if the expected cost of being detected is lower than the payoff from evading.

The social psychological theory, however, suggests that tax compliance is influenced by two main factors: trust in authorities and power of authorities. Wahl et al. (2010) explain trust in authorities to mean the general belief that tax authorities work in the best interest of everyone, while the concept of "power of authorities" describes the taxpayers' perception of the potential of the tax official to detect and punish acts of tax evasion. While trust enhances voluntary tax compliance, enforced compliance is achieved by increasing levels of power.

The fiscal psychological model suggests compliance behavior is influenced by three factors: tax mentality, tax tension feeling, and tax morale. Tax mentality is the taxpayer's decision to comply or otherwise based on personal experience and the social environment. Tax tension feeling refers to the taxpayer dissatisfaction with the tax system and the propensity not to comply with tax obligations, while tax morale is explained to mean the intrinsic motive (resulting from religious principles and his moral values). By employing the fiscal psychological model, we examine whether taxpayers' prior experiences with tax authorities (mentality), their feeling about the tax system (proxied by how they perceive the government and the utilization of the tax revenue), and the intrinsic motive (proxied by religiosity) affect their tax compliance attitude.

D

### Religiosity and Tax Compliance Attitude

Religiosity is the commitment and the application of one's faith, commonly classified into intrinsic and extrinsic components. Extrinsic religiosity is explained as a means to an end, where religion serves a means of obtaining social acceptance and reward. Intrinsic religiosity on the other hand is an end in itself where an individual is committed to his religion and internalizes his religious beliefs (Torgler 2006). An extrinsically inspired individual uses his religion to acquire comfort and security and to experience a sense of belongingness, while an intrinsically inspired individual strives to live and practice his religion as an essential part of his life.

Religiosity has been examined on several issues including moral judgments, ethics, norms, and personality traits. Some limited attempts have also been made to link religiosity to tax compliance behavior. Torgler (2006), for instance, assessed the relationship between tax morale (intrinsic motive to pay tax) and religiosity and found a positive relationship between them. Mohdali and Pope (2012), however, found that the willingness to honor tax obligations is largely driven by the intrinsic religiosity and not extrinsic. To them, religion reinforces an individual's moral and ethical perception, fortifies his "sense of obligation," and eventually improves his tax compliance attitude.

### Perception Toward Government and Tax Compliance Attitude

Governance plays a critical role in influencing tax compliance attitude of people. Fauvelle-Aymar (1999) points out that three factors, legitimacy,

efficiency, and credibility of a government, are critical in shaping the attitude of taxpayers to comply with the tax provisions in a country. Thus, the willingness to comply with tax provisions may be dependent on whether the citizens view the government of the day to be legitimate or otherwise, approve of the government's actions and have trust in the governance systems. Where citizens presume the government to be illegal and not credible, the motivation to comply with tax provision is likely to be low. Thus, the perception of the citizenry toward the government may influence their tax compliance behavior.

The argument has been that taxation constitutes one of the important sources of revenue by which government finances its projects and hence, most citizens usually expect the government to be accountable in the administration of the tax revenue through the provision of social amenities in a cost-effective way. The tendency to oppose the payment of tax is usually high if taxpayers cannot match the responsibility to pay tax with government effort in addressing their infrastructural needs. As Feld and Frey (2007) point out, citizens in most instances are willing to honor their tax obligations if public services provided by the government can be matched equitably with the taxes. Where this expectation of the citizen is not met, compliance becomes an issue. Thus, tax compliance attitude is more likely to be positive when citizens can see its manifestation in a form of provision of essential amenities for the public good.

### Attitude of Tax Authority Toward Taxpayers

Governments worldwide appoint a relevant authority to be in charge of its tax administration. While studies on compliance behavior have often focused on studying the behavior of taxpayers, important insights could be gained on the tax compliance discourse by taking a critical look at the behavior of the tax authorities and their dealings with the taxpayer. According to Muehlbacher and Kirchler (2010), a healthy interaction between tax authorities and taxpayers enhances cooperation of the latter in complying with their tax obligations. It is believed that the manner in which the tax authority treats taxpayers has important implications on their willingness to pay their taxes and their tax morale. This is why Feld and Frey (2007) suggest the need for the tax authority to be tactful in dealing with taxpayers as it constitutes one of the important means of inducing compliance. To them, it is more prudent for the tax authority to adopt a respectful approach in dealing with taxpayers as it serves as an incentive to comply with tax laws.

Wahl et al. (2010) describe two forms of relationship (antagonistic and synergistic) that can exist between the tax authority and the taxpayer in the famous slippery slope framework. In an antagonistic environment, both parties see each other as "opponents." Since taxpayers in this environment are hesitant in honoring their tax obligations, the tax authority is always on the lookout for evaders. In the synergistic environment however, it is presumed that a combined effort of both the taxpayers and the tax authority is crucial in ensuring an effective tax system. As a result, the tax authority views it necessary to give off their best by treating taxpayers with trust and respect. Thus, the type of relationship that exists between the parties involved in the administration of tax is relevant in shaping tax compliance behavior.

## Methodology

### Design, Research Instrument, and Data Collection

The survey-based method of research was adopted with questionnaires as the principal means of data collection. Printed questionnaires were administered to the respondents in class during the second semester of the 2017/2018 academic year. To ensure voluntary participation and elicit honest response; the students were assured of the confidentiality of their responses which were to be used for the purposes of the study only. The questionnaire used consisted of two sections. The first section sought the views of respondents on tax compliance attitude and the factors that influence such attitudes (religiosity, perception of government spending, attitude of tax authorities) using a seven-point Likert scale (where 1 represents a strong disagreement and 7 represents a strong agreement) to the statements used. The specific items used in measuring each of

the construct were adapted from the work of Mohdali and Pope (2012).

### Respondents

A total of 400 valid responses were used for the analysis made up of 258 postgraduate business students and 142 nonbusiness students. The sample had an equal distribution of males and females as the males outnumbered the females by a difference of 12. More than half of the respondents were between the ages of 25 and 30 (57.5%), and their religious background suggests majority of them are Christians (76.3%). Table 1 presents details of the demographic characteristics of the respondents.

### Data Analysis Procedures

An exploratory factor analysis was initially conducted on the study constructs to examine their dimensionality. Regression analysis was subsequently employed to ascertain whether the variables of interest were good predictors of the tax compliance attitude of the respondents.

### Exploratory Factor Analysis (EFA)

The principal component extraction criterion using the varimax rotation method was employed for EFA. The Kaiser-Meyer-Olkin values for each construct exceeded the 0.7 threshold, indicating sampling adequacy (Kaiser 1974). Bartlett's test of sphericity also yielded very significant and satisfactory results, a confirmation that the data set was fit to conduct EFA. The EFA results yielded two factors for both "tax compliance attitude" and "religiosity," while three factors emerged from the construct "perception toward government." A summary of the EFA results is presented in Tables 2, 3, and 4.

**Determinants of Tax Compliance Attitude, Table 1** Descriptive summary of demographics

| Variables | Frequency | Percent |
|---|---|---|
| **Gender** | | |
| Male | 206 | 51.5 |
| Female | 194 | 48.5 |
| **Age** | | |
| 25–30 | 230 | 57.5 |
| 31–35 | 98 | 24.5 |
| 36–40 | 49 | 12.3 |
| 41–45 | 23 | 5.8 |
| **Course major** | | |
| Business | 258 | 64.5 |
| Nonbusiness | 142 | 35.5 |
| **Religious background** | | |
| Christian | 305 | 76.3 |
| Islam | 95 | 23.8 |
| **National pride** | | |
| Not proud of Ghana | 97 | 24.3 |
| Proud of Ghana | 303 | 75.8 |

## Regression Results and Discussions

Table 5 presents results from the regression analysis using the Ordinary Least Square (OLS) estimation technique. The results show the effect of the variables of interest: perception toward government, attitude of tax authority, religiosity, and control variables (national pride and course major) on tax compliance attitude. There are two different regression outputs as shown in Table 5. Model 1 of Table 5 shows the relationship between the independent variables and voluntary tax compliance attitude, while Model 2 contains results based on enforced tax compliance attitude.

Results of Model 1 suggest intrinsic religiosity, perception of fairness, national pride, and course major have significant influence on voluntary tax compliance attitude. A positive and highly significant relationship (at 1% level) was found between intrinsic religiosity and voluntary tax compliance attitude. This demonstrates that individuals who strive to live and practice their religion as an integral part of their daily life exhibit high tax compliance attitude voluntarily. Extrinsic religiosity was also positively related to tax compliance attitude though statistically insignificant. These results demonstrate that religiosity plays an important role on tax compliance attitude. As argued by existing studies (Mohdali and Pope 2012; Torgler 2006), religion imposes a sense of moral and ethical responsibility on an individual which improves tax compliance attitude.

The results also show that when individuals perceive the tax system to be fair, the motivation to comply with tax is high. Impliedly, individuals

Note: P-values are in parentheses

are more willing to honor their tax obligations when they have confidence in the authenticity of the tax system. Course major was negative and statistically significant, an indication that business students have higher compliance attitude than nonbusiness students. As a proxy for tax knowledge, this finding suggests that higher level of tax knowledge has a positive influence on compliance attitude as shown by some empirical studies (Ali and Ahmad 2014; Eriksen and Fallan 1996).

Using enforced compliance as the dependent variable produced similar results as the voluntary compliance. As shown in Model 2, intrinsic religiosity, perception of fairness, and national pride were found to be full predictors of enforced tax compliance attitude. Taken together, results of both models indicate that the intrinsic component of religiosity, perceive fairness of the tax system, national pride, and knowledge on tax laws are the main determinants of tax compliance attitude of people.

## Conclusion

Taxes remain one of the most effective means by which nations mobilize internal resources for growth and development. In reality however, it has been a huge challenge for most governments as well as tax authorities to convince individual taxpayers to honor their tax obligations to the state. Consequently, studies aimed at identifying the determinants of tax compliance attitude have emerged in recent times. This study contributes to extant literature on tax compliance by examining the influence of religiosity, perception toward government, and attitude of tax authority toward taxpayers on tax compliance attitude.

Findings of this study showed that religiosity as a generic term has an impact on tax compliance attitude. Specifically, the intrinsic component of religiosity as intrapersonal religiosity has a positive and statistically significant influence on tax compliance attitude. Further, the perception of taxpayers toward the government (in terms of equitability of government and fairness of the tax system) was also found to be positively associated with tax compliance attitude. Again, an individual's knowledge level and the extent to which citizens are proud of their country have important implications on their tax compliance attitude.

These findings therefore imply that, as part of the broad strategy of government to influence voluntary tax compliance attitude, it is important to promote religious values among taxpayers. Religious teachings should therefore be geared toward establishing the importance of honoring one's civic responsibilities especially with the issue of taxation which forms one of the most important civic responsibilities. By so doing individuals will voluntarily comply with their tax obligations.

Even though "nobody likes paying taxes" (Feld and Frey 2007 p.105), individuals upon realizing the effective mobilization of government revenues will be inclined to honor their tax obligations. Public services provided by the

government therefore ought to substantially amount to tax payments. Also, the tax structure should be segregated on fair bases such that no one pays more or less tax than expected. These constructive measures will go a long way to positively influence taxpayers' compliance attitude.

In addition, tax education should be promoted in the various colleges. It is important for students to be exposed to the tax structure of the country irrespective of whether or not they are pursuing a business-related course. By so doing they will be highly informed about how the tax system operates and also the socioeconomic developments that have come about as a result of effective utilization of the tax revenue. This will help individuals better appreciate the importance of paying taxes to the state.

In spite of the significant contribution of this study, the findings are limited in some respects. First, the respondents of this study were students from only one public university among the many universities in Ghana, and this could affect the extent of generalization of results. The use of students from various universities, both public and private, in the country could improve the generalization of results. Second, this study focused mainly on income tax to examine the taxpayers' compliance attitude. Future researches may include other forms of taxes, such as corporate tax, gift tax, and value-added tax among others, to enhance existing literature on taxation issues. Future studies may also explore the issue qualitatively to provide a deeper understanding of the determinants of tax compliance attitude.

# Developed Welfare

Mario Benito Mazzoleni and Diego Paredi
University of Brescia, Brescia, Italy

## Synonyms

Institutional involvement; New social state; Social innovation

## Definition

The task of addressing past and current needs, without delegating to either the market alone or the action of the public administration, enables new forms of collaboration, involving various parties, creating other modes of action between public and private cooperation.

## Introduction

Within the last few decades, the concept of "social" needs has been changing. This concept has now broadened dramatically both having the effect of establishing an "interventionist" state culture (e.g., Krugman 2009) and the objective expansion of social inequalities (e.g., Atkinson 2015) which has, very recently and quite unpredictably, brought about new needs; one needs only to think of the effects from significant immigration or that which is connected to the early expulsion from the production sector with millions of people still without a possibility of pension subsidies (Mazzoleni 2013). As a result of the continuing financial cuts in welfare systems, redefining measures in social security has become a key requirement (e.g., Hulst and van Montfort 2012). Together with this, there are two other aspects to consider; the ongoing difficulty in providing solutions to centralized monetary payments focusing on direct payments (pensions, various subsidies, citizens' income, etc.) and the inadequacies of the Italian welfare system (and in some rare exceptions, those also found elsewhere in continental Europe) that have become obvious in recent years following the level of services offered (Lippi Bruni et al. 2012). It is becoming increasingly clear that there is a need to move beyond the idea of delegating responsibilities of welfare to the state alone, in the same way that social (and economic) ineffectiveness leads to imagining these same delegations being put to the market alone. For this reason, in recent years, there has been a growing interest with respect to innovative ways of structuring and delivering services of a high social content. Above all, new ways of engagement which lead businesses that work alongside regional authorities, lenders alongside trade unions, nonprofit businesses alongside organizations not only to deliver, but also to design services for the individual.

## The Paradigm of "Evolving Welfare"

The role of welfare seems relevant irrespective of the various ideologies and governments that have contributed to it over the last 200 years (e.g., Spicher 2000). Over time, there has been a shift from delegating this role only to the people to favoring a vision whereby both state and market attempt to share responsibilities. The exponential growth of needs, coupled with the difficulty of addressing them through traditional methods and the explosion of economic burdens generated by interventions, slowly led to the need of "new" approaches and new organizational and governmental solutions (Giacomini et al. 2015, 2018). Besides the specific debate between those who advocate either a greater or lesser involvement of the state (or, vice versa, of the market) to address this kind of problem and acknowledging the need not to neglect the effects of underestimating what can be achieved, socially, and economically, without intervening on the increasing needs of this kind, the different stakeholders who are, in turn, confronted with this situation, have begun to think of new pathways which can tackle the issue. The principle values of solidarity which the majority of countries are founded upon, that have in the past paid close attention to the subject of welfare, form the "ideological" basis on which the "developed welfare" model develops. The practice of managing "common goods" (e.g., Demsetz 1967) sets the basis on which to build this new model. The model is based upon on the intent to aggregate individuals, associations, public administration, lenders, enterprises, employers, and trade union organizations to address social, environmental, and other contextual issues. This cooperative effort between the aforementioned parties leads to addressing the subject of welfare through applying a unified solidary vision, strongly orientated toward problem solving. This guiding idea has allowed us to find participatory and effective solutions to otherwise unsolvable problems, thus representing a first pillar on which to build a new behavioral model that has started addressing broader social issues alongside existing welfare issues. Ultimately, the model of developed welfare begins from the assumption that social, environmental, and other contextual issues can be addressed with some of the following assumptions: micro or "territorial" issues should be separated from those which are "macro," focusing on the former, since those

which are considered "macro" can only be addressed through policies made at a national or supranational level.

In search of solutions, the "micro" approach must be coupled with the so-called globalization model. More specifically, having general measures and a logical framework in order to apply and adapt in accordance with local specifications (e.g., Dirlik 1996). Micro-level solutions can only be effectively identified by involving all the different stakeholders that work within the concerned area. With these assumptions in mind, the model requires a first stage, an engagement between stakeholders which allows for sharing methods and approaches. Secondly, the challenge lies in arriving at a prioritization of issues that need to be addressed. This is approached by the direct involvement between various stakeholders. There is a need to see past the problems during the analysis stage and encourage the different parties to evaluate themselves both in terms of their influence on the economic and social balance, and also in relation to the ability to intervene as problem solvers. This establishes clear modes of action and generates operational responsibilities of the different parties in sight of various issues. At the same time, this collaboration helps to empower individual parties to work "systematically." That is to say that they are not only responsible for actions directly related to their areas of intervention, but they are also required to carry out their work respecting the principles on which this approach is based; those of shared participation and shared responsibility. Another of the prerequisites for action is encouraging those in charge of projects to define the general effects in a concrete and objective manner by means of data which is not only qualitative, subdividing the planning by outlining the timings for action.

Once the priorities and operational responsibilities have been defined, the model provides for a continuation of the established processes leading to:

- A systematic monitoring of the actions taken
- Results being systematically recorded and verified throughout the various planning stages
- Sharing the obtained results among stakeholders, through a possible relaunch and redefinition of methods that can be adapted to a "feedforward" logic
- A verification of the obtained results and the congruency of the outcomes expected to be useful throughout the new phases of the project

The model therefore requires, first of all, a strong ability to select mechanisms designed to identify activities that are able to mediate between urgency and feasibility. Secondly, out of the need to share the model's validity and effectiveness, the model requires the need to operate with methods of involvement and shared responsibility in accordance with parties and institutions called to work with systematic approaches. Also, it requires an explicit willingness to "question the status quo" and agreeing to operate through highly flexible approaches. From an operating point of view, the model requires two "critical" figures to be entrusted with the responsibility of directing, guiding, and verifying. The first being a methodological presidium officially entrusted with planning and initiating the project. The second is the "play maker" of the project, the director and facilitator of the operational activities. The first figure should be considered as a critical element from a professional point of view, while the second one is fundamental in order to exercise its role in social, institutional, and behavioral guidance.

## Conclusion

The developed welfare model brings with it certain elements of discontinuity with the past that, if implemented, can present important opportunities, the first and foremost being a collaborative work ethic between "parties" and "institutions." The need to adopt new paradigms demonstrates the first element of criticality and, at the same time, the potentiality of the model.

The criticism arises from the fact that, with respect to both the parties and when considering the methods of involvement, a new, unconventionally explored method is being realized.

Culturally, it represents a significant challenge when envisaging parties collaborating "around a table," often contributing a difference in ideas, direction, implementation, and verification. At the same time, creating approaches that would lead these parties to "get involved" in new ways offers the opportunity to obtain unconventional ideas and develop methods which can, in their innovativeness, effectively solve issues that would otherwise not find an adequate solution. A second potential element is one which is related to the need of addressing problems, being sure to look thoroughly at their analysis in order to assess the effect which they specifically have and to give an indication to the real solving potential that the new approach brings with it.

A mix between the pragmatic nature of "doing" paired with the necessary ability to criticality choose the different areas to be faced, obliges the involved parties to overcome the learned hypotheses that often lead to suggesting sufficient solutions which are proven to run up against unforeseen or undervalued difficulties. Therefore, new procedures and paradigms end up with generating multiplier effects allowing to hypothesize useful methods and approaches (also from a cultural point of view) in order to deal with a reality facing a steep and unpredictable transformation.

# Developing Public Administration with Performance Dialogues

Harri Laihonen and Tomi Rajala
Faculty of Management and Business, Tampere University, Tampere, Finland

## Synonyms

Dialogic accounting; Dialogic performance management; Learning forums

## Brief Description

This entry summarizes the discussion on performance dialogues and offers four reasons why performance dialogue is considered a promising approach in public administration seeking to consolidate the values of pluralistic societies by engaging in collaborative governance.

## Introduction

In pursuing development, the public administration quite often encounters problems that are interdependent and multidimensional. Poverty, homelessness, population aging, climate change, and unemployment are all examples of problems requiring the input of the entire administration. To solve such societal issues, public managers need to engage in problem-solving processes that cannot be conducted within a single organization,

because these challenges are by nature multi-level, multi-actor, and multi-sectoral (Head and Alford 2015). The need to solve such problems has increased the demand for collaborative governance. Whether we talk about governance networks (Klijn 2008), policy networks (Klijn and Koppenjan 2000), network governance (Rhodes 2017), cross-sector collaboration (Bryson et al. 2006), public value governance (Bryson et al. 2014), participatory governance (Fung and Wright 2001), holistic governance (Perry et al. 2002), or governing hybrids (Johanson and Vakkuri 2017), they all refer to some form of collaborative governance aiming to solve the current problems in the public sector by creating collaboration between different actors, be they public, private, or third sector actors. Pluralism is a typical feature in collaborative governance, and therefore, negotiations that consolidate pluralistic views on public sector values, objectives, as well as ways of organizing and measuring public administration and services through performance measurement and evaluations are common. One way to conduct these negotiations is a performance dialogue.

Rajala et al. (2018) defined performance dialogue as a process in which "participants jointly interpret performance information and discuss it while identifying the actions needed to manage the performance according to this information." This interpretative process is increasingly needed as co-creation, co-production and other collaborative approaches become the state-of-the art in public management and public value creation. Moreover, performance dialogue is often required in approaches like public-private partnerships (e.g., Hodge and Greve 2007) and hybrid organizations (e.g., Johanson and Vakkuri 2017), which have become increasingly popular in administrative practice.

Collaborative governance in public administration also means that performance management has become more of a joint effort involving multiple actors. Indeed, several scholars have recognized and emphasized the need for performance dialogue in collaborative performance management and proposed various methods for putting this idea into practice (e.g., Moynihan 2005; Laihonen and Mäntylä 2017; Rajala and Laihonen 2019a). This short entry summarizes the discussion on performance dialogues and offers four reasons why performance dialogue is considered a promising approach in public administration seeking to consolidate the values of pluralistic societies by engaging in collaborative governance.

## Performance Dialogue in Addressing Complexity and Ambiguity

One of the main premises used to justify collaborative performance management is that no actor is able to solve the prevailing complex societal problems alone. Another reason for collaborative performance management arises from the ambiguity associated with performance information. Ambiguity relates to actors' differing perspectives on performance information, and collaborative performance management involves different actors with differing perspectives (Vakkuri 2010). The ambiguity inherent in performance information becomes an even more interesting and challenging issue when the focus is on interorganizational or cross-sectoral collaboration, because the variety of perceptions related to performance becomes even more diverse.

Given the complexity of the problems emerging and to address the ambiguity of performance information, interaction and dialogue are called for. These afford an opportunity to increase the use made of performance information, collective knowledge and expertise. Indeed, a group capable of productive discussion may be more than the sum of its parts, and this increases the organizational capacity to solve difficult problems and to identify the ambiguity arising from performance information. In this line of thinking, the common argument is that a well-functioning team can better address the different sides of the complex problems in performance dialogues than could any individual alone. In addition, confirmation bias (e.g., James and Van Ryzin 2016), where the public manager only seeks, interprets or favors performance information confirming existing conceptions can be avoided by incorporating

different people with dissimilar beliefs to the performance dialogue. Recognition of the ambiguity associated with performance information may serve to prevent poor decisions neglecting some important interpretations due to confirmation bias. Having an open performance dialogue with colleagues about the different perspectives arising from the ambiguity can help an individual to recognize her own confirmation biases. This indicates the following: performance dialogues use organizational diversity to expose the ambiguity and to make decisions taking better account of the disparate values concerning performance and interpretations of performance information.

Dialogue-based models emphasize the acceptance of ambiguity and complexity as simply inherent in public service systems. Ambiguity and complexity cannot be removed from public sector activities that are multifaceted and ambiguous. However, the point of the performance dialogue is to turn ambiguity and complexity into a strength and a potential for renewal by using collective thinking to create the big picture describing the prevailing situation. Besides comprehensively describing the overall situation, a performance dialogue provides a forum where different interpretations are debated and new meanings are created based on the available information and creative thinking. Generating the big picture, debating about perspectives relating to performance information, and creating new meanings and practices all enhance the understanding of the overall situation.

## Using Dialogue to Break Organizational Silos and Performance Illusions Inhibiting Development

The main argument arising from the literature is that as the complexity of the problems to be solved increases, there will be a corresponding need to invoke collaborative management. In complex situations, citizens' expectations and requirements regarding a public service cannot be met by an individual organization – an efficient public service system calls for efficient cross-sectoral collaboration and shared objectives (Lönnqvist and Laihonen 2012). Indeed, organizational silos separating different actors from each other make it difficult to solve broad societal issues requiring comprehensive government intervention. Because performance dialogue generates interaction and a mutual understanding of performance among companies, citizens, and public managers operating in different administrative sectors, this type of dialogue is one way to break organizational silos causing insufficient interaction between people inside and outside of the organization silo. The literature has proposed various structural and functional ways to encourage dialogue in public administration. Learning forums (Moynihan 2005) and performance dialogues (Laihonen and Mäntylä 2017) are some examples of these concrete ways of breaking organizational silos with collaborative performance management practices based on dialogue addressing the performance results and future actions needed in light of these results (e.g., Busi and Bititci 2006; Verdecho et al. 2009).

Research on performance dialogue has so far provided some guidance on how to break organizational silos inhibiting collaboration. The most recent studies on performance dialogues reveal preliminary findings on how organizational silos are created and sustained in individual performance dialogues and how performance dialogues can be used to break such silos (Rajala and Laihonen 2019a; Rajala et al. 2019). Moreover, research has also shown how dialogues about performance results are used to form series of performance dialogues that convey important information throughout the entire public sector organization and to its stakeholders, be they private sector companies or citizens. In breaking organizational silos, it is beneficial to understand the ways in which effective performance dialogue series create knowledge networks that increase the awareness of how every actor in the public service network contributes to the others' activities and to the overall well-being of public service users. Earlier research has also investigated which institutional logics and roles are present in performance dialogues – and which are not (Rajala et al. 2019). This knowledge on institutional logics and roles in performance dialogues may

help in break the institutional silos that currently inhibit cross-sectoral collaboration within the public sector and boundary-crossing efforts in service production between public, private, and third sector organizations and citizens.

The aim of performance dialogue is to dispel these harmful delusions and practices in organizational silos through collaborative sensemaking. In practice, breaking the organizational or institutional silos helps to dispel illusions that different actors may have regarding their respective contributions to the public sector service system as a whole. Organizational silos may sustain illusions about performance existing within these silos by blocking conflicting views arising from other parts of the public sector organization or from other organizations, such as private companies or third sector organizations. Successful performance dialogue can debunk such illusions simply by bringing together and combining the alternative viewpoints and diverse knowledge of different actors and by fostering the creation of a shared view of the situation between the different people taking part in the performance dialogue.

One major risk with performance dialogues is that they may be used improperly, in which case they either further strengthen the existing organizational and institutional silos or then retain them in their present state. Another noteworthy point is that performance dialogues may remain superficial and insufficient, can lead to a false understanding of the overall situation and to shortages in collective action due to these problems in understanding. When performance dialogues generate problems rather than solving them, organizations are not utilizing their full potential nor making optimal use of resources. The management and use of performance dialogues is thus an art form itself that should be further studied as we still know very little about this art form. Research has so far shown that the challenges of performance dialogue seem to reflect problems typically associated with performance information use in general. As to managing and using performance dialogues to break organizational silos, public managers need to make successful choices on purposes, topics, participants, forums, time spans, and dialogue methods. Moreover, creating knowledge networks for collaborative governance by using performance dialogues involves public managers' considerations concerning:

1. Synchronization between the performance dialogues and other organizational activities
2. Division of labor between different performance dialogues
3. Right gatekeepers transferring knowledge from one dialogue to another
4. Performance dialogue hubs that connects all important performance dialogues and their conclusions to one forum

It is true that management can create opportunities and conditions for successful performance dialogue but ultimately the ability and willingness of the personnel and various stakeholders to handle performance information and discuss it determines whether organizational silos can indeed be broken. Thus, performance management taking place in performance dialogues is a collaborative effort. This means that not only top management but also the whole organization and each individual employee will be responsible for performance management. Thus, personnel and stakeholders should also know how to generate efficient performance dialogue.

## Performance Dialogue: A Continuous Process

Discussion on learning forums and performance dialogues easily focus on individual dialogues although the performance dialogue is quite often a continuous process where a series of performance dialogues conveys information and knowledge through the organization and feeds it to the decision-making venues at the right time. Indeed, a more profound step towards collaborative performance management is taken when performance dialogue is perceived as a continuous and integral part of performance management practices. Then, each participant practices collaborative management, and participants can therefore play an important part in shaping the dialogue and

determining the course of the organization. For an individual public servant, performance dialogue and collaborative performance management can mean greater responsibility if each participant becomes responsible for analyzing and interpreting performance information. Involving personnel in performance dialogues can create cohesion and integration among staff and stakeholders by assigning people joint tasks but it also means costs as personnel will have to devote their time to analyzing performance information. Hence, the benefits of this involvement need to outweigh the costs of it; otherwise, the total value of performance dialogue is negative to the organization.

Mastering the management of any individual dialogue is a starting point for any public organization adopting performance dialogue. Managing a particular performance dialogue is not an easy task itself and requires knowledge of how to generate a functional dialogue between people. However, moving from individual dialogues to organizational dialogue that creates integration and cohesion throughout the whole public sector organization is a more difficult task and calls for a system-level understanding of how different spheres of public administration and different professions engage with each other through an integrative dialogue. This integrative dialogue is achieved if series of performance dialogues are coordinated and not isolated and decoupled from each other. In linking together different performance dialogues, management should seek answers to questions like: what kind of practices and structures support a performance dialogue that can break organizational silos, and what incentives encourage cross-sectoral and interorganizational collaboration and dialogue?

When the linkage of different performance dialogues is in focus, the critical question relates to the ownership of the dialogue. By ownership, this entry refers to questions addressing who ensures that the messages are conveyed all through the organization and its collaborators to help decision-making and organizational learning and who checks that all the needed dialogues actually take place? These questions also raise a counterquestion: how and to what extent can or should performance dialogues be managed in the first place or should they form a more free-floating communication and learning system that can produce innovations and learning more freely? All these questions relate to previous academic discussions on how performance dialogues are controlled in the public sector. It seems that performance dialogues can be controlled with traditional management controls. For example, setting joint topics and purposes for distinct performance dialogues can integrate different actors and create a sense of cohesion.

## Performance Dialogue: A Control and Learning Mechanism

Performance dialogue may serve many purposes. According to the literature, one interesting juxtaposition relates to the relationship pertaining between two different purposes: namely learning and control. It has been claimed that performance dialogue develops shared understanding but also has a role in decision-making and management control (Rajala and Laihonen 2019b). In many cases, performance dialogue precedes decision-making and can control the decisions because the jointly created understanding may dictate the decisions of participants and their actions occurring after the dialogue. This type of performance dialogue is a management control in its own right. Interestingly, performance dialogue can be steered with other management controls as the shared understanding formed in the dialogue can be controlled with traditional management controls, such as organizational structure, bureaucratic controls, or even cultural controls. However, from the viewpoint of learning, excessive control may be detrimental to learning and creativity.

It seems that dialogue can be considered as a way to learn and create shared understanding, but at the same time, it also provides an opportunity to control learning and future actions. As a control mechanism, performance dialogue can be used to set objectives, create a shared view of the performance among the internal and external stakeholders, and it can be used evaluate the success of the operations and dialogue itself. Because

performance dialogue may offer actors freedom to select objectives or the concrete ways to achieve these, it may be classified as an enabling control mechanism. In enabling performance dialogues, power and control are continuously rebuilt within the dialogue, and people feel empowered as they can all have power and exercise control over the situation. Further, the themes, topics, and objectives of the dialogue are defined in the dialogue by the participants rather than in advance and by someone else not participating in the dialogue. This creates a continuously evolving process that determines what the dialogue is and what it seeks to achieve. New participants and performance information can also be brought into this dialogue when needed when performance dialogues are predesigned to be enabling rather than coercive.

If performance dialogues do not allow much freedom of choice, then they are used as a more coercive control. According to research, many of the factors affecting the outcome of the performance dialogue are typically defined beforehand and placed on the agenda of the meeting. This creates predefined dialogues and leaves very little room for innovation and the emergence of new ideas. For this reason, it is not unusual that participants feel powerless in coercive performance dialogue because all the important decisions have already been made before dialogue takes place, thereby making the dialogue a mere formality.

On the one hand, there is sometimes a need for strict governing of the dialogues, and this necessitates the use of management controls. After all, the fundamental task of an organization is to coordinate the efforts of its employees. In strict governance of the dialogues, the organizational hierarchy, the prevailing organizational culture and administrative bureaucracy, as well as professional coordination mechanisms ensure that the needed dialogues take place and that these dialogues serve predesigned purposes. For example, by controlling the series of performance dialogues with job design and division of labor, it is possible to generate cohesion and integration between different performance dialogues and the participants involved.

On the other hand, the governance may on occasion rely on self-regulation and autonomy, while the management system is more based on trust. This means that instead of formal control mechanisms, public managers rely more on flexible forms of performance dialogue and collaborative action. This enabling form of performance dialogue may be better suited to dynamic environments where it is difficult to successfully plan everything beforehand.

## Conclusions

The performance management literature discusses collaborative management requiring new organizational structures and approaches. This entry shed light on performance dialogue as a form of collaborative management by explicating the reasoning on why performance dialogue is considered a promising approach in public administration. According to these reasons, performance dialogue is a useful tool in:

1. Dealing with complex societal problems and ambiguous performance information
2. Breaking organizational silos and dispelling illusions concerning public sector performance
3. Generating cohesion and integration between different levels of administration and between public sector and its external stakeholders
4. Controlling the learning and future actions of the actors involved in public sector service production

At best, performance dialogues increase the awareness of the determinants affecting performance, and this awareness can be further improved through systematic management of performance dialogue. Collaborative performance management and performance dialogue can therefore play a critical role in future performance management. In practice, it seems that management needs to consider both the role of performance dialogue more widely as well as the management of individual dialogues. Both types of considerations are needed when building and developing performance-driven organizational

culture and behavior. As the literature shows, performance dialogues can be fostered by establishing formal guidelines and developing meeting practices. Yet performance dialogue can also arise unexpectedly and on an ad hoc basis. These *ad hoc* approaches remind us that the flow of knowledge is sometimes difficult to predict and model in performance dialogues because people may quite spontaneously discuss their successes and failures, and during this communication, they may learn from each other and develop better and more efficient ways of responding to the existing challenges. Thus, knowledge and performance-driven behavior is often a far more complex phenomenon than the simplistic data – reporting – decision-making – models suggest.

In light of the foregoing, future studies can investigate whether ambiguity and complex societal problems can be handled more efficiently using performance dialogues than using other methods. Another interesting question to be addressed is when performance dialogues can break organizational silos and adverse illusions about the performance and what types of dialogue can accomplish this. What factors affect the level of integration generated with performance dialogues could also be further investigated.

## Synonyms

Policy development, implementation, and assessment; Stages heuristics and alternative theories; Steps in the making of public policy; The how and why of policymaking

## Definitions

Public policy is a set of interrelated decisions that are taken by actors in the governmental and nongovernmental realms to resolve a problem or issue of concern to the public. Each step in the process of resolving the problem has different issues and needs which have to be addressed. Ultimately, however, activities at the different stages should be mutually reinforcing toward the accomplishment of a common purpose, that is, resolving the public problem. How the chain of activities is carried out, the opportunities and challenges that are encountered in carrying them out, and the outcomes these efforts achieve will vary from jurisdiction to jurisdiction. In this article, the process of designing, implementing, and evaluating public policy in the developing context of Ghana is examined to determine its congruence or incongruence with that in developed countries.

## Introduction

The term process connotes temporality, an unfolding of actions, events, and decisions that may culminate in an authoritative decision, which, at least temporarily, binds all within the jurisdiction of the governing body. In explaining policymaking processes, the emphasis is much more on the unfolding than on the authoritative decision, with attention devoted to the structure, context, constraints, and dynamics of the process, as well as to the actual decisions and events that occur (Schlager 2007: 293). The policy process is the study of change and development of policy and the related actors, events, and contexts (Weible et al. 2012). Policy scientists argue that public policy is best conceived in terms of a process (Jenkins 1978; Anderson 2006). This is because policy decisions are not "something confined to one level of organization at the top, or at one stage at the outset, but rather something fluid and ever changing" (Gilliat 1984: 345). This joins Rose (1969: xi) when he asserts that, "policy making is best conveyed by describing it as a process, rather than as a single, once-for-all act." This process involves negotiation, bargaining, and accommodation of many different interests, which eventually give it a political flavor. These political interactions happen within the network through which decisions flow, programs are formulated and implemented, and interorganizational dependencies and interactions take place. Thus "policymaking" is not a simple rather a complex dynamic process involving series of actions and inactions of varieties of groups with varieties of interests at different stages. It is crucial to state here that public policymaking not only involves the public bodies or public operatives as policy players, but also private or nonofficial groups play a very active role in policymaking. This public-private interaction constitutes the structure of the political system within which policy actors influence the policy process (Osman u.d.). It is true that many policy matters across jurisdictions are understood in terms of concepts already rooted in the emerging discourse on public policy in general (Horowitz 1989: 198). Moreover, there are similarities between developed and developing countries in terms of the constraints encountered in the policy development and implementation process. Such constraints relate to, for example, the plenty of room for slippage at each stage of the policy process. Another is the unintended consequences that attend all policymaking efforts. Nevertheless, the policymaking process in developing context is

different from that of the developed world. One of the differences is that the structure of the political system in the developed world is greatly different from that in developing countries. Others are the unfavorable research conditions usually experienced in the latter: scarce data, difficult logistics, sometimes suspicious officials, regime instability, inadequate policy capacity, and rarity of inclusive politics, just to mention a few (Horowitz 1989). This makes the existing theories or models of public policymaking derived from the developed countries inadequate to explain the policymaking process of developing countries.

So if there are similarities and differences between the policy processes of developed and developing countries, the questions that arise are: (1) To what extent do these processes converge or diverge? (2) Do the similarities in the policy processes outweigh the dissimilarities and vice versa? (3) What factors are responsible for the similarities and differences in the policy processes? (4) What are the consequences of the similarities and dissimilarities in the policy processes? (5) What lessons can be drawn from the consequences to improve policymaking in the developing context? These questions are investigated specifically in relation to Ghana as a case in developing contexts.

The rest of the paper is organized such that part two examines the policy process in Africa, part three explicates the framework for assessing the policy process in Ghana, while part four analyzes the public policy process in Ghana. The final section is devoted to discussion and conclusion.

## Public Policy Process in Africa

Anangwe (1997) argues that the principal issues of concern in respect to African policymaking are several. First, African policymakers do not seem to understand their policy environments and the kinds of problems they generate. This is attributable to the social distance between the policymakers and the rest of the population. The former belong to the elite group, and their background makes them perceive policy problems from a perspective that is somewhat impaired, resulting in wrong policies being made vis-a-vis policy problems that confront the bulk of the population.

Second, African policymakers seem to be making decisions without adequate information because of poor articulation between political and administrative roles in the process. Often politicians would like to seize the initiative in making certain policies, and they tend to do so without adequate knowledge of the consequences – a problem that could have been avoided if they had listened to the expertise which the bureaucrats possess (Anangwe 1997; Grindle and Thomas 1991). In addition, research institutions have been sidelined in a manner that precludes their findings as input to the policy process. Third, the inability to mobilize adequate resources as well as the inability to effectively utilize capacity renders policymaking a symbolic exercise. Policy implementation in Africa is also confronted with diverse problems. For instance, implementation rates of national development plans in the recent past have ranged between 5% and 30%. Another obvious constraint is the politicization of policy implementation (Anangwe 1997).

Many interest groups are also not always aware of the content of policy until implementation kick starts. It is only at this stage that powerful actors realize what a policy contains, and they then make vigorous attempts to frustrate the implementation of unpalatable aspects of such a policy (Anangwe 1997).

Policy evaluation is another problem area because the feedback mechanism in African policymaking process is deliberately weakened. African policymakers do not like to hear that their policies are performing poorly. Here, process mistakes remain undetected and uncorrected. At the same time, no meaningful lessons can be learnt from past performance within this milieu. Notwithstanding these problems, it is fair to acknowledge that some successes have been registered in Africa in some specific areas, the most prominent being in education and health (Anangwe 1997).

## Framework for Assessing the Policy Process in Ghana

Evaluation of a policy cannot simply take account of the stated objectives for change (Chapman et al. 1997: 208). In this connection, the criteria that are used to evaluate Ghana's public policy process are three: program, process, and political dimensions (McConnell's 2010). These three criteria are reconcilable aspects for assessing policy success. The program criterion refers to policy attaining or exceeding its original programmatic or technical goals, at roughly the same cost, with the same degree of effort, and within the same period of time as originally envisioned (McConnell 2010). In this view, policy learning has often been viewed as an activity within government related to the attainment of these technical aspects of policies, and it is expected that management strategies such as the acquisition of more and better data and analysis can enhance the probability of policy success by reducing the risk of policy failure through poor information collection and use in policy formulation or implementation.

The process measure denotes simply a policy being able to proceed from idea to reality through the successful completion of the many stages of a policy process (Bovens et al. 2001; Brandstrom and Kuipers 2003). In this process sense, a policy is often judged a success if it successfully goes through a complex, veto-point-filled and multi-actor approval process to creation and implementation, regardless of its actual ability to "deliver the goods" in terms of its substantive program effectiveness or efficiency (Lindblom 1959).

The process dimension contains five stages: agenda-setting stage, formulation stage, implementation stage, adoption stage, and evaluation stage. These phases may fail because of the following: the agenda-setting stage is such that overreaching governments take on too many simultaneous initiatives (Baumgartner and Jones 1993); the formulation stage entails governments attempting to address "un-addressable" or "wicked" problems where neither the cause of a problem nor the solution to it is well enough known (Churchman 1967) to generate feasible policy alternatives; the decision-making stage is fashioned such that institutional venues designed for serial or seriatim processes may bog down policies (Jones 1994) or where governments engage in logrolling and other forms of bargaining behavior which undermine the integrity of policy proposals (Anderson and Heywood 2009); the implementation stage is such that governments take on the implementation of too many policies beyond their organizational capacity to provide results (Meier and Bohte 2003); and the evaluation stage is such that actors fail to properly evaluate the results of their policies and thus fail to incorporate this knowledge into subsequent policy reforms (May 1992). The political dimension highlights the negative political consequences of adverse policy outcomes on subsequent political evaluations and the fortunes of policymakers (Wolman 1981).

## The Policy Process in Practice in Ghana

In the preceding section, the criteria for evaluating public policy process have been well enunciated. These criteria which are the process, program, and political dimensions are applied in the assessment of Ghana's policy process.

### Process Dimension

The subcategories of the process dimensions that are discussed here are the agenda-setting stage, formulation stage, adoption stage, implementation stage, and evaluation stage. These subcategories are now examined in turn below.

#### Agenda-Setting Stage

In terms of the agenda-setting stage, successive postindependence Ghanaian governments have sought to tackle the seemingly insurmountable problems facing the country by rolling out prestigious and ambitious projects and programs. The scope of these policy initiatives in major sectors is usually very vast and expansive. For example, Dr. Kwame Nkrumah, the first postindependence leader of the nation, gave Ghana a good start in her developmental race. During Dr. Nkrumah's regime (1957–1966), the state was involved in various socialist development projects. The government was supported by urban dwellers who

wanted an expanded state sector, rapid industrialization, and economic self-sufficiency (Joeng 1998). Up to the early 1960s, attempts at building major infrastructure and many prestigious projects and programs like the construction of the Akosombo Hydroelectricity Dam and building of the industrial township of Tema were funded partly from revenue from exports of cocoa. However, decline in cocoa prices on the world market and cost of big projects rift havoc on the balance of payments. The instability of the Nkrumah development strategies were linked to their dependence on expansive, imported capital-intensive technology and on heavy investment in infrastructure (Joeng 1998). To finance such a program, the government had to borrow from the World Banking system, engage in deficit financing and monetary expansionism, and impose higher taxes. Political discontent following economic instability facilitated the collapse of the nationalist Nkrumah regime (Joeng 1998).

Similarly, the current Akufo-Addo-led NPP government (2017 to date) won power in the 2016 elections on the back of gigantic promises. It sailed to victory in the elections on the basis of a highly ambitious campaign platform and manifesto promises. Some of the 2016 manifesto promises included free senior high school education, one district one factory (in a country of 216 districts), one village one dam (in a country of several scores of thousands of villages), one constituency one million dollars (in a country of 275 constituencies). and construction of a railway from the southern to the northern part of the country (a track of more than 1500 km) (NPP 2016). These promises are overambitious when considered against the financial capabilities of the country. To illustrate, Ghana's total public debt stood at GHC17.7 billion at the close of 2010, which represented 38.9% of GDP and rose to GHC35.1 billion or 48.4% of GDP in 2012. It climbed further to GHC76.1 billion, equivalent to 67.1% of GDP in 2014. By March 2015, the total public debt stock reached GHC88.2 billion representing 65.3% of GDP (Institute of Fiscal Studies 2015). Ghana has long depended on foreign aid or loans from international financial institutions to supply part of its foreign currency needs. However, non-concessional external debt stock increased considerably from US$90.1 million to US$838 million in 2008 and then to US$1.45 billion in 2012. The government also issued another Eurobond in 2015 to raise US$1.0 billion which summed up to US$2.75 billion Eurobond issued in three consecutive years (Institute of Fiscal Studies 2015). Against this week financial backdrop, it is therefore not surprising that since assuming office in January 2017, to date no single factory has yet been built. The 275 constituencies have each received naught of the promised one million dollars, and no village has yet been provided with a dam, nor has work commenced on the railway project. It is perhaps to presage this problem that Jenkins' (1987) definition of public policymaking includes a stress on the fact that it should be within the capacity of the state to achieve.

### Formulation Stage

At the formulation stage in Ghana strides are usually made to address "un-addressable" or "wicked" problems where neither the cause of the problem nor the solution to them are well enough known (Churchman 1967) to generate feasible policy alternatives. For example, successive governments since independence in 1957 have attempted incorporating the informal sector into the tax net without much success. The following characteristics of the informal sector are not well understood: identifying informal actors; the economic activities they engage in; the size of their economic activities; the revenue or income they accrue on a daily, weekly, or monthly basis and their variations; their residential addresses; changes in their business profiles; their capacity in charging and deducting tax especially value-added tax; and their ability to do the necessary paper work to file their tax returns, which are all not only difficult to pinpoint or measure but they are also not well understood. Without understanding these characteristics of the informal sector operators, it will be quite formidable to introduce tax reform that will effectively incorporate the informal sector into the tax net to increase the much needed government revenue.

Another wicked and intractable problem in Ghana is bribery and corruption. Successive governments since independence to date have pledged to uproot it. Nevertheless, they end their terms of office leaving the problem even worse than what it was when they assumed office. All the four military governments, namely, the National Liberation Council (NLC) (1966–1969), National Redemption Council (NRC) (1972–1979), Armed Forces Revolutionary Council (AFRC) (1979), and Provincial National Defense Council (PNDC) (1981–1992), which overthrew democratically elected governments, cited corruption and financial mismanagement as one of the reasons for the coups. For example, the AFRC military regime of Flt. Lt. Rawlings that toppled the military government of the NRC had a slogan of "cleaning the house," meaning ridding the system of corruption before handing over to a civilian government. But after the civilian Limann's government to which power was handed ruled for only 27 months, it was overthrown by the same Flt. Lt. Rawlings citing among others, corruption for his action (Gyimah-Boadi 1994). On assumption of office, this time under a junta known as the PNDC, Flt Lt. Rawlings waged a campaign of probity and accountability. By applying radical tactics and organs like the Citizens Vetting Committee (CVC), the National Investigations Committee (NIC), and the Public Tribunals and pure vile rule, the junta caused fright in the public and confiscated the property of wealthy businesses, lodges, and professionals in anti-elitist corpus action (Gyimah-Boadi 1994; Oquaye 1993). It also chased citizens into exile or imprisoned them on grounds of corruption and carried out political executions (Gyimah-Boadi 1994: 77).

Yet by the time the PNDC rule ended in 1992, corruption was not eradicated; it rather worsened. Likewise, all the civilian governments of the first, second, third, and fourth republics of Ghana have all, on assumption of office, promised to rid the country of corruption but left office leaving corruption much bigger than what it was when they came into office. For example, former President Kufuor (2001–2008) assumed office with a promise of zero tolerance for corruption but left office when corruption was at a very high level. A survey report by Transparency International in the late 2003 confirmed this claim when it indicated that corruption has worsened in Ghana 3 years into the Kufuor's administration (Adu-Asare 2006). The canker of corruption persists because it is hydra-headed requiring a multipronged approach, but this is lacking. For example, there is no political will to deal with it since its tentacles extend to cover the political elite.

### Decision-Making Stage

At the decision-making stage in Ghana, it is common for institutional settings designed for serial or seriatim processes to bog down policies (Jones 1994) or for governments to engage in logrolling and other forms of bargaining behavior which undermine the integrity of policy proposals. For example, the president and the ruling party virtually go unobstructed in abusing incumbency for personal as well as partisan electoral interest. Executive dominance has also made it possible for successive governments to resist the introduction of transparency-promoting instruments, such as access to information legislation and public officeholder asset disclosure laws (Ayee et al. 2011). The vast powers of the president enable him to ignore the views of other actors including public opinion. This has often led to street protests and demonstrations, opposition boycott of parliamentary proceedings, and critical press and memorial lectures. To illustrate, the proposal to introduce the National Health Insurance Scheme was done by former President Kufuor without much public consultation. This led to protest by labor unions and boycott of proceedings in parliament by the then opposition National Democratic Congress (NDC) (Mohammed 2013). Similarly, the sale of Ghana Telecommunication Corporation to British Vodafone was done in an elitist way by the same Kufuor administration, and this led to the opposition walking out of parliament during the adoption of the policy. Likewise, the nationwide matches and protests against the value-added tax (VAT) which former President Rawlings introduced were done in an exclusionary manner. The protests led to four deaths before it was withdrawn and reworked (Mohammed 2013).

### Implementation Stage

At the implementation stage in Ghana, cases abound where governments have taken on the implementation of too many policies beyond their organizational capacity to provide results. For example, the immediate past President Mahama made in his NDC party manifesto a total of 540 promises which were captured under four thematic areas. These areas included the economy, governance, social policy, and infrastructure. The NDC's own assessment indicated that government was able to achieve at least 80% of the promises (Appiah 2016). However, IMANI Ghana, a think tank in a research report, claimed that the NDC government was able to achieve only 53% of the 540 promises (IMANI Ghana 2016). It elaborated that the government's best performance was in education where it scored 69%. The NDC government from 2012 to 2016 had invested GHC28 billion in the education sector. IMANI Ghana assessed that access to education had improved greatly under President Mahama. The government's flagship educational policies included the conversion of polytechnics to technical universities and the establishment of 200 Community Day Senior High Schools (IMANI Ghana 2016).

However, the government was weakest in the implementation of promises under the economy where it scored 44%. The NDC government pledged in 2012 to maintain a GDP growth of at least 8% per annum, maintain a single-digit inflation rate, reduce fiscal deficit to 5% of GDP, increase per capita income from $1,600 to $2,300 by 2017, and improve the international reserve to 4 months of import cover (Appiah 2016). Besides 2012 when GDP grew by 8%, the economic growth had been sluggish at 3.5%. Government had also a maximum of 3-month import cover over the 4 years (IMANI Ghana 2016).

Promises under the infrastructure sector were only 55% fulfilled where the government sunk a whopping GHC3 billion which was claimed to be the most massive infrastructure development in the history of Ghana. While under governance, the score was 51%, with social policy initiatives meeting 52% of the pledges made (Appiah 2016; IMANI Ghana 2016).

### Evaluation Stage

At the evaluation stage in Ghana, governments usually fail to properly evaluate, if at all, the results of their policies and thus fail to incorporate this knowledge into subsequent policy reforms. According to the National Development Planning Commission (NDPC), there is no system of active evaluation of national projects and programs, making the evaluation aspect of policy virtually nonexistent. The few projects that undergo proper evaluation are donor-funded projects which have strict evaluation conditions (Mingle 2016).

This lacuna in the policy process prompted calls for the establishment of a National Evaluation Policy (NEP) which a Senior Technical Advisor at NDPC, Dr. Grace Bediako, described as a critical tool to promote accountability and transparency for the efficient and effective implementation of development projects. By evaluating policy at various stages, Dr. Bediako said the nation would know the success or otherwise of such projects and help in deciding whether to scale up. She believed the NEP would therefore help to create a database from which future projects could draw lessons so as to avoid mistakes and challenges that often hinder the implementation of projects and programs (Mingle 2016).

On his part, a Monitoring and Evaluation Specialist at UNICEF intimated that a NEP would provide a good mechanism to support evidence-based decision-making in rolling out national development projects. He said the evaluation policy will help us pause and reflect on the projects and programs. He added that the NEP would help to answer three key questions: (1) Are we doing the right thing? (2) Are we doing it right? (3) Are there better ways we can do it?

### Other Process Issues

Other process issues in the Ghanaian policy process, like elsewhere in the developing world, are several. First, there is participation deficit in the policy process in Ghana – there are fewer participants in policymaking, and the quality of participation is poor. Participation refers to citizens having a clear avenue that provides space for their input, the participatory tools used, and the

information made available as well as the feedback provided. Given the positioning of citizen involvement as an appendix to representative governance, authentic or meaningful participation is critical to good policymaking and governance. Such participation occurs when the potential exists that citizen involvement will shape policy decisions, which requires that public administrators and policymakers be committed to genuinely considering citizen input in policy analysis and decision-making (Smith et al. 2000; Woodford and Preston 2011).

In Ghana, elitist and exclusionary approaches to public policymaking have had preponderance over participatory and inclusive styles. For example, the amendment of the 1957 Constitution and the promulgation of the 1960 Constitution, which converted Ghana from a multiparty system to a one-party rule, as well as conferred live tenure on President Nkrumah, were conducted in an exclusionary manner (Frimpong 2007; Gyimah-Boadi 2010). Among other things, the changes were aimed at silencing dissent and safeguarding an executive-controlled legislature (Frempong 2007). Another example was the enactment of the Prevention Detention Act by the same government under which persons could be detained without trial (Frimpong 2007). The Union Government concept (a combination of military and civilian-appointed government) that was proposed by General Acheampong's military government was passed without public consultation (Frempong 2007; Institute for Democratic Governance 2007). Mass opposition to the concept forced the military regime to let a referendum to determine the proposal's fate. Predictably, the concept was defeated in the process. The economic recovery program, formulated under the Rawlings military rule, was launched with little, if any, public involvement (Gyimah-Boadi 2001; Vordzorgbe and Caiquo 2001).

More recently, there have been a series of policies which development and implementation have adopted elitist and exclusionary approaches. For example, the defense pact Ghana Government recently signed with the United States which was approved by the Ghanaian Parliament was objected to by the public through street demonstrations. The pact, among others, will allow unfettered access to Ghanaian military installations by the US military (Daily Graphic 2018). Another example was when the Kufuor's democratically elected government designed and implemented the National Health Insurance Scheme without much consultation which culminated in protests particularly by labor unions (Agyeapong and Adjei 2008). A further case was when the elected government of President Atta Mills pursued the STX Korea Housing Deal in a nonparticipatory manner in 2010, objection to which by the public led to its withdrawal (Daily Graphic 2010).

Other elitist and exclusionary policymaking included the value-added tax (VAT), cancelation of teacher and nurse trainee allowances, granting of refuge status to two Guantanamo Bay detainees, review of the 1992 Constitution, petroleum price increases, mandatory toll levy, and Ghana's new spying bill. The value-added tax (VAT) was adopted as a policy in Ghana in 1995 in an effort to deal with the inefficiencies and shortcomings of existing consumption taxes and to enhance the revenue capacity of government. Attempts at implementing VAT sparked worst street demonstrations in recent memory, comparable in terms of number of fatalities to the February 28, 1948 riots which had prompted the development of mass nationalism (see Austin 1964; Tordoff 1997: 40). Four people were killed, and many others sustained severe injuries, and then the Rawlings' National Democratic Congress (NDC) government was forced to scrap it. Similarly, on February 15, 2016, the Parliament of Ghana's Committee on Defense and the Interior introduced to the public a new Ghana's new spying policy that would give sweeping powers to the Ghanaian government to spy on its own people. One of the major reasons for the introduction of the bill was that, "it will provide Ghanaian security, intelligence, and law enforcement agencies with more power to fight crime, terrorism, drug trafficking, and identity theft." This was done without public consultation and civil society organizations objected to the bill. Two principal justifications out of the many reasons advanced for objection to the bill were that: (1) there "is the

morbid eternal fear, that without a clear definition of the crimes and offences, innocent Ghanaians will be monitored for acts that do not fall under crimes" and (2) it "infringes on the privacy of the Ghanaian citizen which is guaranteed by the constitution" (Raviv 2016: 2). A further example is the national tow levy which was introduced by the current Akufo-Addo NPP-led government in 2017. As part of the law, vehicle owners and motorcyclists will be expected to pay compulsory annual fees ranging from GHC20 to GHC200 in a year, for towing services. The First Deputy Speaker of Parliament, Joe Osei-Owusu, argued that the levy was essential to eliminate the carnage on Ghanaian roads. He argued that the policy is in the supreme interest of road users after research showed that a huge number of road accidents are caused by broken down vehicles (Brakopowers 2017). Civil society organizations and the general public objected to it as bad on many grounds. For example, IMANI Ghana, a think tank, queried the levy as unjust, badly designed, probably corrupt, and unlikely to achieve its goals (Brakopowers 2017).

Second, the legitimacy of many Ghanaian regimes particularly the one-party and military ones was, and continue to be, in question. Regime legitimacy is said to exist when citizens support their government because they believe it has a moral right to rule over them (Gilley 2009). It thus refers to the quality of the relationship between the citizens and the regime. This moral right again is argued to issue from a belief that the regime serves the common good of society and not just the interests of certain groups within society (Eastern 1965: 311; Gjefsen 2012). Legitimacy is thought to be one of the critical factors in a regime's ability to govern effectively and to maintain its ability to govern in times of crisis. By giving the regime a moral foundation, the regime then has the right to expect the obedience and cooperation from its citizens, which is important for the efficient organization of any society and for political life in general and public policymaking in particular (Eastern 1965; Gjefsen 2012). A regime that loses legitimacy will have to employ other measures such as coercion, threats, and force to obtain obedience and cooperation from its citizens. Obedience by compulsion may render the regime susceptible to collapse. However, support and cooperation based on willful acceptance that is the right thing to do makes legitimacy the "ultimate soft power" (Gilley 2009: 149).

The most common requirements for establishing regime legitimacy are democratic and constitutional rule. In a democracy, the exercise of authority is bound by law that enjoys some form of popular sanction. It is also dependent on the congruence between the values of the citizens and the values that underpin the regime (Beetham 1991; Gjefsen 2012). Furthermore, it hinges on support for regime performance that is whether or not citizens support the way the regime functions in practice (Norris 2011). Both democratic and authoritarian regimes can have problems meeting the expectations and needs of the citizens to deliver concrete results. Moreover, it is a function of support for regime institutions such as citizens' trust and confidence in the main political institutions of the regime like the government, the parliament, the courts, and the bureaucracy.

In Ghana, the most common requirement for regime legitimacy was absent for a considerable part of her life as an independent nation. In her 61 years as an independent country, Ghana has lived under 6 years of one-party rule, 22 years of military dictatorship, and 33 years of democratic reign. Under authoritarian regimes, only the governing elite, dominated by the head of government, made authoritative allocation of values for the rest of society. One of the key reasons for the agitations for independence was that colonial administration excluded the majority native population from decision-making and the development process. The hope of the colonized was that independence and constitutional rule will democratize public policymaking by allowing all stakeholders to participate in the process. Democratic rule was cherished and continuous to be cherished because it was, and still is, believed that it is only in a democracy that differing values and interpretations of factual evidence can be mediated (Steelman 2001).

Ghana wanted to avoid military rule and other forms of undemocratic rule like obtained in Latin

America in the 1920s and the Middle East in the 1950s for several reasons. Undemocratic rule gaged free press and freedom of expression, curtailed fundamental human rights, disrespected the sanctity of private capital, and most importantly excluded the citizens from the development process by allowing only the few governing elites to make authoritative allocation of values for the rest of society (Handelman 2006).

Even under democratic rule today, the executive, led by the president, has dominated the policy process with the other actors including the legislature, judiciary, and bureaucracy as well as civil society playing peripheral roles. This perception is connected to the notion of the imperial presidency – a phenomenon describing the appropriation by the president of reserve constitutional powers and sometimes usurpation of the powers of those of other democratic institutions (Schlesinger 1973; Prempeh 2008). The third wave of democracy has impacted Africa: imposed term limits on African presidents, dulled the repressive outlook of governments, expanded the latitude of personal liberty, and improved the climate of competitive party political contest. Nevertheless, power in African countries in general and Ghana in particular and state resources remain largely in the hands of the president (Prempeh 2008).

Third, policy concerns in Ghana, like everywhere in the developing context, do not match those that predominate in the West. The advanced industrialized nations have witnessed a massive expansion in the scope and output of centrally directed policy (see Beer 1973: 53 cited in Horowitz 1989). In contrast, a Third World country like Ghana is unable to mobilize the resources needed to fund an extensive welfare state that pertains in the developed world. For example, Ghana has only been able to introduce a pilot cash transfer system known as the Livelihood Empowerment Against Poverty (LEAP) to vulnerable Ghanaians such as the aged and physically challenged. Each beneficiary receives about GHC60, an equivalent of $13.6 per month, and the coverage is less than 10% of the country, with disbursement being erratic and sometimes in default.

Some policy concerns that are topical in developed nations like the legalization of same-sex marriages, the accommodation of transsexuals, and the endorsement of prostitution and brothels are no-go areas in Ghana. This prompted the former UK Prime Minister, David Cameron, to warn African leaders to be prepared to face a slash in British aid if they failed to adhere to what he called "proper human rights." The Prime Minister was obviously concerned about the recent anti-gay hysteria in some African countries including Ghana, Uganda, and Malawi. The United Kingdom had already suspended its budgetary support to Malawi over the same concerns (Sidibe 2011). The Ghanaian state was warned it would suffer a similar sanction if it continued its anti-gay stands. In response, late President Atta Mills said that, Ghana had a sovereign right to adopt its own laws and reminded Prime Minister Cameron that Ghana was no longer under colonial rule (Sidibe 2011). Faith-based organizations and the Ghanaian public in general have vehemently condemned the legalization and recognition of those minority groups and called on successive governments to come clear on their stands on those issues. President Millis' response therefore spoke their language.

Fourth, the literature on the public policy process generally discusses civil engagement processes as if all country governments around the world have complete ownership over their affairs (see, e.g., Fishkin 2009; Fung 2006). This study draws attention to the dilemma policymakers in developing nations face in responding both to internal and external constituencies. The analyses of the value-added tax (VAT) and the World Bank-inspired structural adjustment program in Ghana showed the differences between policymaking in developed nations and developing countries. The analyses indicated how in developing context like Ghana a wide gap can exist between the preferences that are domestically desired and the proposals that are externally imposed by the donor community to the detriment of the developmental aspirations of the developing country concerned. The British involvement with the VAT policy development was evidenced by the appointment of the Crown Agents of the United Kingdom, who

eventually won the contract to design the VAT project (Osei 2000). Thus, while public policy in the advanced industrial nations responds primarily to the needs and demands of their domestic electorates, policymakers in developing countries must simultaneously address the needs of their domestic constituencies (who can vote them in or out of office but do not have the resources to finance development) and external constituencies like the World Bank, IMF, and the British Overseas Development Agency (ODA) (which wield no electoral muscle but use their financial power to advance policies often seen as more ideological than pragmatic). Consequently, developing countries are denied policy autonomy or policy space to adopt national policies that meet the hopes and aspirations of their citizens and their peculiar political circumstances. The result is that the policy demands of their people may be downplayed, while the ideology-driven prescriptions of the donors are given prime place.

Fifth, the state structures of Ghana like most other Third World nations, whatever their weaknesses, are still relatively powerful vis-à-vis its society. Despite the fact that the burdens shouldered by the Ghanaian state are not consistently weightier than those assumed by a developed country, the size and impact of the state, in relation to the society, are far greater. Juxtaposed with developed countries' institutions, the state structure in Ghana as in other developing countries is weak, their legitimacy doubtful and their capacity to compel change imperfect at best, yet what the state does may, however, be extremely crucial for a developing country (Horowitz 1989: 201) like Ghana. For example, the state is still the largest employer in Ghana, while in developed countries like the United States, it is the private sector which is the largest employer. Consumer subsidies are discernible across sectors such as electricity, water, and gas as well as education, while neonatal and postnatal services are paid fully by the state in Ghana. In contrast, in the West, producer subsidies are the most prevalent (Horowitz 1989).

Mediating institutions, that is, the types of organizations that can pursue their interests and activities to greater extents separately from the state, are in general more developed in industrial societies than in Ghana and other developing nations (Diamond 1989: 22–29). For example, in Ghana, the Criminal Libel Law under which journalist could be detained indefinitely for alleged slander of political functionaries especially the president was scrapped only in 2001. Per the law, the press was gagged and could only express what pleased the government. Revolutionary politics in Ghana during the Rawlings revolutionary period strangled civil society. It separated the country into "people" and "citizens," that is, friends and enemies (Oquaye 2000: 69). Those who were construed as "people" were members of the Committees for the Defense of the Revolution (CDRs) and the revolutionary organs including the 31st December Women's Movement (DWM), while those who were viewed as "citizens" embraced the Ghana Bar Association, the Medical Association of Ghana (GMA), the Association of Recognized Professional Bodies (ARPB), the University Teachers Association of Ghana (UTAG), and the Ghana Employers Association and Masonic Lodges (Oquaye 1995).

In the absence of freedom of expression, civil associations cannot make their objectives, interests, and demands openly known, much less publicize their activities as well as their views and comments on the government's policies and measures (Drah 1996). Thus, during the military regimes, CSOs could not assume their role as a countervailing force in the policy process to provide alternative proposals to the regimes' – making the juntas to dominate the public policy process. Even in the current democratic dispensation, some journalists still complain of molestation by security agencies and the police. For example, only 3 days ago, that is, April 28, 2018, a TV3 journalist in attempting to film the crowd outside the premises of a court where the former Chief Executive Officer of the COCCOBOD was being tried for alleged financial malfeasance had his camera seized and was arrested and detained and later released (TV3 2018).

Sixth, the capacity of the Ghanaian state, just like other Third World countries, to make and execute policy is, in several respects, more imperfect than that of their counterparts in the West.

There are dissimilarities between developed nations and developing countries like Ghana in terms of institutional capacity and policy effectiveness. To illustrate, advanced states have superior capacity to collect taxes than a developing nation like Ghana due mainly to poor logistics, lack of proper and updated database on taxable units, and inadequate tax base valuation expertise in the latter (Petio 2013). Generally, what was described in the literature on political development – the "penetrative capacity" of policymakers and implementers, that is, their ability to make their presence and policies felt throughout society (La Palombara 1971) – is considerably superior in advanced industrialized nations than their counterparts in the Third World. Thus, as Horowitz (1989) surmises, it makes sense to infer that such dissimilarities might compel governments in the Third World to worry about the efficacy of their policy innovations and thus employ somewhat brute approaches of enforcement.

Moreover, Ghana like most developing countries is unable to mobilize superior levels of knowledge and analytical capacity on questions related to policy. The modern state is reputed for its access to extraordinary quantities of information. For several decades, systematic data collection has been a crucial exercise of governments in the developed countries, and often, documentation became a real preoccupation (Horowitz 1989). It appears a given that policy should be predicated on expert knowledge backed by specialized information – that is, information beyond what can be obtained from everyday experience or intuition (Horowitz 1989: 202). The tendency to depend on differentiated expertise is obviously integral to the comprehensive division of labor that epitomizes developed countries. In Ghana as a developing nation, functional differentiation is much less marked. In Ghana, there is inadequacy of personnel with the requisite skills, and data collection is not only inadequate but also inaccessible, inaccurate, and dated to be of much utility for policymaking (Ayee et al. 2011). The European colonial powers did establish the culture of data collection in some of their colonies perhaps most notably in India (Horowitz 1989). Nevertheless, it is still commonly a fact that Third World nations', as Hirschman (1975: 392) notes, "motivation to solve a problem may arise in advance of adequate understanding."

Accordingly, there is frequent dependence on foreign experts and importation of "solutions from external sources in the form of the most up-to-date central banking legislation, economic planning agencies, or common market schemes" (Hirschman 1975: 392), just to mention a few. In Ghana, for example, the development of the Ghana Poverty Reduction Strategy I and the Growth and Poverty Strategy II as well as the value-added tax policies were all done with the advice and support of donor partners (Mohammed 2013). Undoubtedly, developed countries borrow ideas and institutions as well, but the difference is that they do that much less frequently than Third World states (Watson 1974).

### Program Dimension

The program or outcome dimension denotes the end result – new or revised policies that reflect, to some degree, citizens' input. In Ghana, public opinion is largely incongruent with public policy simply because the people were not involved in the policy process from the onset. Another problem is that the occasions when policies meet their objectives are disproportionately less than instances when they fail to do so. This is attributed to a number of factors: data for policymaking is rarely adequate, accurate, and up-to-date; enforcement capacities are limited; regimes have dubious legitimacy; and capacity constraints are prevalent (Ayee et al. 2011; Mohammed 2013). Together these minutiae make the stakes of policy very high in Ghana, and the challenges to regimes that are provoked by policy are also considerable. Thus, policy in Ghana as elsewhere in the developing world has a high-risk quality that is less frequently discernible in advanced industrial societies.

### Political Dimension

The political criterion highlights the negative political consequences of adverse policy outcomes on subsequent political evaluations and the fortunes of policymakers (Wolman 1981).

Policies can fail less through program or process-related issues, but for political reasons. As many scholars note, policy outcomes have political consequences affecting the ability of parties and individuals to obtain or retain their positions in government and elsewhere in the political system. And, as social constructivists have noted, designations of policy success and failure are semantic or "discursive" tools themselves used in public debate and policymaking processes in order to seek political, partisan, and often electoral advantage (Hood 2002). Policy failures easily translate into declines in electoral support and legitimacy (Hibbing and Theiss-Morse 2002) and can result in the growth and success of rival parties and contestants for office even in nondemocratic systems.

In Ghana, perceived policy failure or inability to meet the needs of the people or the breakdown of the social contract between the government and the governed is discernible across governments. For example, during President Mahama's (2012–2016) regime, rising cost of living triggered by upsurges in petroleum prices and increases in existing taxes and the introduction of new ones, as well as the cancelation of teacher and nurse trainee allowances, eroded the legitimacy of the government. The then opposition New Patriotic Party (NPP) particularly its then flag bearer, Nana Akufo-Addo, seized the opportunity afforded by the trying circumstances to label the government as incompetent and campaigned on a platform of change. In particular, he promised to scrap the new taxes, remove the increases in the existing ones, as well as restore the teacher and nurse trainee allowances. Not surprisingly, he defeated the incumbent President Mahama in the 2016 elections and swept to power on January 7, 2017.

## Similarities Between Ghana and Advanced World's Policy Processes

Notwithstanding the differences between Ghana and advanced industrialized countries' policy processes, some similarities are discernible. These similarities border on the constraints inherent in the policy process: future decisions or policies are informed by past decisions; there are new policy departures; some policies are objected to by the populace; timing is an important element of explanation; organized group pressure is less frequently present, or at least effective, at a time of major policy departures; there is plenty of room for slippage at each stage of the policy process; and there is plenty of room for unintended consequences (Bridgman and Davis 2004; Horowitz 1989: 204–206; Howlett and Ramesh 2003).

For example, in respect of future decisions or policies being informed by past decisions, Ghana's later policies of re-democratization resemble its earlier policies on that subject, as, equally, Nigeria's later re-democratization policies resemble its earlier policies on that subject. This resemblance between past and future policies prompted Moore to assert that policies made in an area fresh in the experience of decision-makers and the relevant public stand a good chance of being cut in the same groove (Moore 1985: 84).

In regard to new departures from national style of policymaking, the military regime of the National Liberation Council (NLC) (1966–1969) which overthrew the Nkrumah's government (1957–1966) and the subsequent civilian government of Dr. Busia (1969–1972) wanted to avoid repeating the Ghanaian past. In the past under Dr. Nkrumah's administration, the 1957 independence Constitution was manipulated to create the 1960 Constitution. The latter enabled Dr. Nkrumah to convert Ghana from a multiparty democracy to a one-party state and conferred life president on him (Frempong 2007; Gyimah-Boadi 1994). A new policy model was chartered that prohibited the one-party state and life presidency and inserted these into the new 1969 Constitution as entrenched clauses (Frempong 2007).

In relation to slippage at each stage, it is true that irrespective of jurisdictions implementing bureaucrats do not always have the same interests or preferences as the elites who made the policy. Bureaucrats may be subject to influences in the course of implementation that did not appear earlier. Moreover, there may be problems of building an effective coordination and communication network among all the individuals, groups, and

organizations involved in implementation to prevent what Pressman and Wildavsky (1984) refer to as an implementation deficit. The fight against illegal mining in Ghana appears not to be chalking success because of such implementation bottlenecks (Mahama 2018). Similar bottlenecks bedeviled the Oakland project in Oklahoma in the United States which was aimed at providing employment for inner city youth (Pressman and Wildavsky 1984).

## Conclusion

This study set out to determine the nature of the policy process in the developing world using Ghana as a case. The assessment of the policy process was captured along three dimensions: process dimension, program dimension, and political dimension. The analysis showed that on these dimensions, Ghana's public policy process is significantly different from that in the advanced industrialized countries. Some of the contextual factors which accounted for the process differences included participation deficit, questionable legitimacy of regimes, narrow scope and output of policy, eroded policy ownership, powerful state vis-à-vis weak society, inadequate capacity of the state, and scarce, inaccurate, and dated information. Consequently, there is a relatively high potential for miscalculations, misalignment between citizens' needs and public policy, protests and demonstrations, policy failure, and regime fragility.

The policy process differences between Ghana and the West are not as difficult to explicate compared to the similarities. Dissimilar access to resources, unequal levels of economic development, and contrasting social patterns can purely generate significant policy framework and policy content divergences between Third World and developed nations.

The similarities of process are more wanting in explanation. It is true that developing nations adopted many of their formal institutions from Western models. Not surprisingly, their informal processes, which occur within the institutions accordingly, are congruent with Western processes. Yet it is common knowledge that capacities constraints make it herculean to match similar forms to dissimilar content. Explanations based on imitation appear improbable to explicate process convergences across the globe.

Rather, the convergences need further explanation. They point to the exigencies of human problem-solving in structured contexts. Policy intervention is often essential because something has gone wrong or less often, because there is a danger that something will go wrong in the future. If something has gone wrong, it probably means there is considerable complexity to the problem and uncertainties about the consequences of alternative solutions (Horowitz 1989). Irrespective of context, the decision setting has its intricate characteristics which vary from jurisdiction to jurisdiction. Yet different contexts all involve multiple actors, competing interpretations, conflicting goals and preferences, and some standard operating procedures through which issues must pass. These constituent elements of the process shift with the shifting circumstances. Thus, for the developed and developing countries, the policy process needs to be seen in terms of the changing pattern of external events and conditions and of internal forces influential in that process (Horowitz 1989).

Given these similarities and differences between developed and developing countries' policy processes, it is apt to assert that the divergences outweigh the convergences. The conclusion is that for a broad general understanding of the dynamics of the policy process of Ghana, models and innovations from the West provide useful guidelines. However, this is far from asserting that they are adequate for an in-depth analysis of the Ghanaian and other Third World countries' policy processes. This is because the socioeconomic and political conditions of a country determine or shape the nature of its particular policy process.

# Development Administration

Frank L. K. Ohemeng
Department of Public Administration, College of Law, Commerce and Public Affairs, Incheon National University, Incheon, South Korea

## Synonyms

Direction; Government; Improvement; Management; Organization

## Definition

Those aspects of and changes in public administration necessary to carry out policies, projects, and programs that will improve social and economic conditions, and the study of such administration.

The bureaucratic process that facilitates or stimulates the achievement of socioeconomic progress through utilization of the talents and

expertise of the bureaucrats. It involves the mobilization of bureaucratic elite skills for speeding up the development process.

## Introduction

Development administration is one of the many perspectives from which scholars understand the underdevelopment of many developing countries, particularly in Africa and other parts of Asia, and what can be done to change it. Development administration may be even more relevant today than when it first emerged in the aftermath of the Second World War; globalization produced a one-size-fits-all approach through concepts like the New Public Management (NPM) and reinventing government.

Currently these global ideas have found resonances in concepts such as governance, collaborative governance, the new public governance, and public networks, among others. Unfortunately, while these ideas gain traction implementing them continues to be problematic in developing countries, which want to develop their public bureaucracy as the condition for better overall development. Bureaucracies in most developing countries are less able than in the developed world, making it very difficult for them to undertake the kind of development common elsewhere. It is thus important to revisit the idea of development administration to see how it can fit into the modern or even the postmodern developmental ethos, and how it can be used to enhance development in developing countries. In other words: Is development administration relevant today?

## The Emergence of Development Administration

Development administration, then, is a post-Second World War concept. It emerged with the decolonization of many countries in Africa and Asia, as part of the ripple effect of the war in the 1950s. The war made these countries globally more significant, inasmuch as some had participated on behalf of their colonial masters. Its aftermath saw agitation for better public service delivery and, in some cases, public service jobs. Before it, colonial authorities had largely ignored the development of their colonies. In some cases the clamor for better public services and jobs generated civil unrest and the demand for independence.

Achieving independence, however, did not solve these countries' problems. The government machinery, particularly the bureaucracy, was inadequate, and faced tasks it had not been set up to perform. Creating an effective governmental system, with an efficient and capable bureaucracy that could meet these developmental needs, then became paramount.

Development administration thus emerged out of the realization that governments and their bureaucracies in less-developed countries needed to be recreated and revitalized as a prerequisite for transforming those societies. It became both an academic discipline and a prescription for implementing and administering government programs for economic development (Hope 1984: 64), as scholars, particularly in the United States, and the United States government grappled with the problem of how to build such bureaucracies.

This thinking was necessary in view of the fact that these newly emerged independent countries faced the mammoth tasks of nation building, and consequently needed civil service institutions with the skills to undertake core development functions, including the generation of policy and program alternatives in different sectors, program planning, implementation monitoring, and service delivery and access. Administration in newly independent countries was sadly wanting in its capacity to meet these demands of independence, nor could the transfer of public administration from the Western world, as an instrument of development meets the developmental expectations in these countries.

### The CAG and the Evolution of Development Administration

Development administration, then, was one of the United States government's attempts to generate development through technical assistance to newly emerged developing countries after the war. In pursuing this course of action, the primary

concern, according to Loveman (1976), was to find an alternative to the Marxist-Leninist idea of development, which ran contrary to that of the Western democratic ethos, in furtherance of American hegemony in these countries. The US government developed a four-point strategy, where the fourth point was about achieving the objectives of technical assistance. According to Esman and Montgomery (1969), it sought a rather simple solution for a very complex set of conditions. The strategy called for training in modern skills and transferring "know-how" from an American "technician" (or a UN "expert") to "counterparts" in less-developed countries. At the same time Americans were to be put in the position of the givers and the cooperating nationals were to be the receivers of American developed skills and technology. To Esman and Montgomery (1969), therefore, this doctrine summed up technical cooperation in the minds of most Americans (including members of Congress) and many leaders of the less-developed countries (509).

The emphasis on technical assistance was also linked to the transfer of administrative capabilities. Advocates called for a distinct form of administration, using which the government in a developing country would actively lead, stimulate, and centrally coordinate the country's total development endeavor. This American attempt to provide a countervailing force to Marxism-Leninism gave birth to a new public administration scholarly entity: the Comparative Administration Group (CAG), whose members studied development administration from the 1950s in newly independent states in the developing world.

The CAG wanted to advance the theory and practice of comparative public administration, and bring the study of public administration in developing countries into the mainstream in the USA, assisting these scholars in achieving their objective of spreading American development to those countries. According to Schaffer (1971), the group's interest in the relations between public administration and politics was formulated on the premise that "a live and vital public administration" was a necessary instrument of government and politics, and a comparatively beneficent source of welfare. The second point was that there could and should be a new version of that instrument, to be called development administration: which was, perhaps, public administration when it became an instrument in the hands of governments "everywhere" who were "struggling to improve the lot of man" (328).

For the CAG, understanding the nature and development of these newly emerged countries and how they could overcome their developmental problems called for understanding the context and the environment in which established public administration institutions operate. They thus believed that transplanting the American public administration system was unnecessary from both the theoretical and practical points of view. Many CAG scholars found the kind of technical assistance developed by the United States, for example, inapplicable in these countries, although they unanimously agreed about the relationship between politics and public administration and how the two can be used in governing society. They thus questioned the application of American public administration as part of the overseas technical assistance programs of the United States government. At the same time, they agreed that it was important not only to find more appropriate frameworks of analysis but also to carry out empirical studies and operational programs.

The need to develop different theoretical and empirical frameworks to understand these societies led Riggs (1964), for instance, to develop his Prismatic Society idea. In less-developed countries people hold two different sets of ideals – what he called traditional, relatively fused traits, and relatively diffracted traits – at the same time, and they are in constant conflict. Unfortunately, as noted by Hope (1984), the "conflict between the two is not often articulated, but is recognised by the acceptance of an endemic gap between formal expectations and actual behaviour" (66). Riggs (1962) further emphasized the importance of ecology in the study of administration, essentially dismissing scholars who believed that Western administrative systems could be replicated in developing countries without a careful and systematic readjustment of variables to suit the social structures of these countries. He insisted that understanding the ecology of these countries meant not

just reciting the facts of geography, history, social structure, etc., but analyzing patterns of interaction between subject and environment.

## What Is Embedded in Development Administration?

According to Schaffer (1969: 184), development administration is a distinctive form of administration for development programs, policies, and plans in those conditions (traditional, transitional or newly independent, and less-developed political system) in which there are unusually extensive needs (which could coincide with urgently expressed demands of political elites, modernizing ideologies, and exercises in mobilization), precisely where there are peculiarly few resources and exceptionally severe obstacles to meeting the needs. To him, the distinction of development administration is exactly in the inconvenient combination: extensive needs, low capacities, severe obstacles. Concisely, development administration, focusing on the state bureaucracy and political institutions, should create an innovative atmosphere or environment through which governments in developing societies and their developmental partners, particularly the United States and the United Nations, could operationalize and share developmental goals by combining planning (thinking) and acting (doing), minimizing parochialism, diffusing influence, increasing tolerance of interdependence, and avoiding bureaupathology. As Hope (1984) has cogently summarized, the goals of development administration are to stimulate and facilitate defined programs for social and economic progress: or, put another way, development administration is the administration of policies, programs, and projects to serve development purposes. It indicates the complex of the agencies, management systems, and processes a government establishes to achieve its development goals. It thus encompasses the organization of new agencies, such as planning organizations and development corporations, the orientation of established agencies, such as departments of agriculture, the delegation of administrative powers to development agencies, and the creation of a cadre of administrators who can provide leadership in stimulating and supporting programs of social and economic improvement (63–64).

According to the dominant premise of development administration, there are significant and fundamental differences between the public administrative process in less-developed countries and in developed ones. In many respects, the notion of development administration questions the relevance of classical or traditional systems, concepts, and methods of public administration to the demands and challenges in less-developed countries. For instance, there are those who doubt the relevance of the classical Weberian bureaucratic model to those demands. The argument is that having evolved from the experience of Western developed countries, they were not designed to be responsive to them.

The theme of development administration was therefore to develop the administrative capacities of these societies on the premise that economic development can only be achieved with better administrative capabilities. Development administration scholars conceived of administrative capability as involving the ability to mobilize, allocate, and combine the actions that are technically needed to achieve developmental objectives. It should be about civil service structure and extragovernmental institutions. Such capabilities were concerned with the deliberate or artificially induced acceleration (predominantly by public authorities) of growth processes, national goals, and modernization and action programs, with attention to normative prescriptions and value judgements concerning the direction of change. The idea was thus attuned to the problems and needs of developing societies, stressing the setting that provides the political, economic, cultural, and historical context within which administration functions.

### The "Relevance" of Development Administration Today

In recent times the development of developing countries has again become the subject in developmental discourse. Poverty, sickness, war, etc., continue to afflict most developing countries, even in the midst of plenty in terms of natural resources. It is not surprising that poverty

reduction strategies continued to be developed for such countries. Unfortunately, the concentration of development continues to be determined by the market, and championed by the World Bank, the International Monetary Fund, the United States government, and other partners. Nevertheless, the market-based approach continues to lead to state or administrative reduction or thinning out through different strategies, despite the shortcomings of such policies, such as structural adjustment programs. What, then, needs to be done in the midst of these developmental problems? The answer may be in revisiting the very notion of development administration.

Development administration scholars of old and in modern times have identified the importance of administration in development. It seems, however, to have been ignored by proponents of the market idea for developing countries. With the recent focus on the developmental state, the ideas and ideals of development administration have become much more pertinent. One area development administration scholars have concentrated on is the role of the state, especially a capable bureaucracy, in spearheading development. Writing on the role of the public bureaucracy in development, Stone (1965) observed:

> The task of national development therefore becomes in large measure, one of developing political and administrative capabilities to provide leadership and direction. These capabilities are especially critical in administering and coordinating the myriad of activities which must be carried out with varying priorities and according to different time periods. . .For this purpose, the natural and human resources of the country must be identified and utilized to the fullest extent and in the most economical manner. We see in this complex of administrative tasks the greatest challenge facing our administrative capabilities (51)

From Stone's (1965) perspective, the primary obstacles to development are administrative rather than economic, and not deficiencies in natural resources. He goes on to argue that developing countries generally lack the administrative capability to implement plans and programs, and that most persons charged with planning and other development responsibilities in individual countries, as well as persons made available under technical assistance programs, lack adequate knowledge and adaptability in designing and installing organizations, institutions, and procedures suitable for the particular country (53).

What Stone observed in the 1960s is perhaps more relevant today than it was during his time. For instance, the emergence of Information Communication Technologies has rendered bureaucracy's way of doing things a bit more archaic. These bureaucracies continue to face capacity issues that must be seriously addressed to help governments implement their development plans. Administrative capacity thus continues to be a major problem, so that development plans, including poverty-alleviating strategies and fighting corruption, remain a mirage. The need to rebuild a public bureaucracy, just as in the 1960s, is now back on the drawing board. It does not, however, mean implementing a one-size-fits-all approach, but taking into consideration the ecology of the country: As the United Nations said in the 1960s, "the public service should in a very real sense belong to the society it serves, sharing its culture, its values, its problems and its ambitions. Even when external advice and assistance are available and accepted, they must be given an indigenous character, for the public administration is an integral part of a nation's institutions" (UN 1961: 11). This was the idea projected by scholars interested in development.

In current development discourse, however, the focus is more on building a democratic developmental state, a situation projecting an effective role for the state in marshaling all forces to enhance development. Such a state needs a strong, efficient, and effective government machinery (public bureaucracy) that can continue to bring all sectors to the table collaboratively to discuss, develop, and implement public policies. From this perspective, we need the ideas and ideals projected by development administration in helping to build such democratic developmental states in the developing world.

## Conclusion

Development administration, the exercise of intentionally building an effective public administration

in developing countries, continues to provide food for thought to both scholars and political leaders interested in developing countries. Its earlier scholars and projectors had an altruistic attitude to the predicaments of newly emerged countries in the 1950s. Such scholars provided the scholarly and practical platforms on which effective administration could be built and used as the means to provide development. They saw the importance of the role of the state in such development. At the same time, they saw how the state could be effective if its institutions are well equipped with personnel with skills and capacities to develop, plan, and execute public policies.

Today, with the recognition of the role of the state in development, especially after years of promotion of neoliberalism and the shrinking of the state, development administration has taken on greater dimensions than perhaps it did in the 1950s and 1960s. With the call to build democratic development states in these countries, it has dawned on many that without effective administrative institutions built on the values of these societies, reducing poverty, preventing terrorism, etc., will continue to be a mirage. Early development administration scholars showed how administrative capabilities could and should be built. It is time for those interested in the development of developing countries to revisit these ideas, and use them for shaping administrative institutions that have suffered under the neoliberal mantra of development.

## Synonyms

Development administration system; System of development and change; Systems perspective of development administration

## Definition

(i) Development administration can be conceptualized from systems perspective which integrates all the issues pertinent to development within the philosophical foundation of (i) wholeness and (ii) interrelationship.

(ii) Development administration as a system takes inputs from the environment, converts or transforms the inputs into outputs with the help of some withinputs, discharges or releases the outputs into the environment,

and receives feedback manifesting the nature and dimension of influence of outputs upon environment.

## Introduction

Development as a multidimensional phenomenon always accompanies with changes in the system state and essentially involves a profound transformation of entire economic and social structure (Fayol 1949). Functionally, it lies on the increased ability of human societies to shape their physical, human, and cultural environment. It is the responsibility of development administration in any country striving for development to shoulder the responsibility for ensuring developmental changes and transformation in the society by formulating proper policies and implementing the same through a capable administrative system. Development administration thus includes two issues, (i) administration for development as well as (ii) development of administration, one directly deals with the goal and other with the means needed to achieve the goal. Effective and efficient means necessarily refers to the administrative system which is capable of shouldering all the responsibilities of development administration. That is why for initiating development process, first of all a proper administrative system compatible with the demand of development needs to be established. Since development is holistic in nature and upholds the notions of total system, development administration should also be viewed and structured from systems perspective so that it can discharge its developmental responsibilities effectively and efficiently. In this article, attempts have been made to analyze development administration from systems perspective within the broader framework of input, conversion process, output, feedback, and environment.

## Development Administration as a System

Development administration can be conceptualized from systems perspective which integrates all the issues pertinent to development within the philosophical foundation of (i) wholeness and (ii) interrelationship. This perspective is also essential for analyzing the change process occurring in the developing societies (Finkle and Gable 1966). Efforts for development are linked with the whole social system and address all the dominant aspects of the society in integrated manner. Development administration is also a total phenomenon having some interrelated components which interact with each other and with the environment for goal accomplishment. As a system, it takes inputs from the environment, converts or transforms the inputs into outputs with the help of some withinputs, discharges or releases the outputs into the environment, and receives feedback manifesting the nature and dimension of influence of outputs upon environment.

Development is a never-ending process. The continuity of this process practically maintained this continuous cycle of events of development administration. The following diagram represents a general systems model of development efforts/administration (Fig. 1).

The elements shown in the figure, i.e., the environment, inputs, conversion process, outputs, and feedback, relate to and interact with each other. The entire set of these elements and their interactions constitute the system of development administration. Environment, within which the system works stimulates the system- man to receive its products; *inputs* carry stimuli from environment to the development administration; *outputs* carry the results of development actions to the environment; *conversion process* convents/transforms inputs into outputs; and *feedback* transmits the systems elements are briefly discussed in the following section to have a theoretical framework.

## Inputs

Inputs are the raw materials of the system. The production mechanism is primarily based on the inputs received by the system from environment. The system starts its function with the importation of inputs. Types of inputs required by a system

vary from mere information to material resources. Johnson, Kast, and Resenzwing discuss inputs for any system into three broad categories: information inputs, *material inputs*, and *energy inputs*. The latter two are often convertible to each other. Along with natural energy, human resources are also included in the category of energy inputs. Ira Sharkansky points out (i) demands, (ii) resources, and (iii) support and opposition from the citizen as the inputs for public administration. These are also equally the inputs for development administration.

*Demand* manifests the objective conditions in the environment which requires development intervention. Socioeconomic disparities exposed in the form of underdevelopment threaten environmental balance and thereby the forward movement of the society as a whole. These constitute a *demand* for development felt equally by the *advantaged* and *disadvantaged* section of people. The first initiates development process to consolidate or save their position, and the latter supports development efforts for socioeconomic uses of their life. The nature and types of demand are molded by the sociopolitical ideology and by the nature of relationship among the different sections of people.

Only the information inputs describing the exact nature of demand are not sufficient for development efforts. These might be followed by resources like capital/fund, manpower, technology, other raw materials, etc. All or some of these may be mobilized from within and without the country. Sources of these inputs have direct bearing on the process of input importation and conversion process. *Support* and *opposition* of the government, donor people, and other pressure groups affect both the demand for development and flow of inputs to the process of development. If the government policy does not permit the operation of development efforts either NGOs or any other agencies, the latter lose the legal right to work in any modern nation state. Government's support and opposition are reflected in its policy declaration, legal provisions, and administrative behavior. Influence of donors, people, and other pressure groups inside and outside the country plays a vital role in the embodiment of government's support for or opposition to any efforts. Donor's role is the most crucial in the policy decisions of developing countries for their direct financial involvement in the development efforts in developing countries as well as the latter's dependency on the former for development assistance. Donor *support* and *opposition* enhance and restrict foreign fund flow to these countries, respectively. *Support* and *opposition* of people and other interest groups stem from the consideration of the result of efforts affecting them and their interest. Efforts receive strong mass support when these are found congruent with the socio-cultural norms and value as well as with people's expectation, while incongruence produces opposite result. Support of the people, in the development efforts, ranks very high. It ensures people's participation in the development process and helps have sustainable base. The system of development must have sufficient information about the access to these inputs.

## Conversion Process

The system transforms available inputs into outputs. Development system converts the inputs into outputs for the purpose of development. "Feature for conversion process itself affect their actions. These features are given a separate level in order to distinguish them from the inputs that come from environment. Because they originate within the conversion process, they are called *with inputs*" (Sharkansky 1975: 8). *With inputs* in the system of development efforts include (i) organization structure, (ii) personnel, (iii) process/procedures, and (iv) conflicts/contradictions. With inputs are not only responsible for converting inputs into outputs; equally they are responsible for the importation of inputs from the exportation of outputs to the environment to ensure the continuity of conversion process and thereby the achievement of development objectives. Katz and Khan mention five types of functions under five subsystems related to the conversion process: *production*, *maintenance*, *supportive*, *adaptive*, and *managerial*. Production processes with the help of technical proficiency transform energy within the organization. To

**Development Administration from System Perspective, Fig. 1** System of Development Administration

Maintenance of steady-state involves mediating between tasks demand and human needs to keep the structure in operation. Supportive functions include procurement of inputs and disposal of output through transactional exchanges at system boundaries and obtaining social support and legitimization. These are done with the help of societal manipulation and integration. Adaptive functions help the system to cope with the changing environment and expectations and include a number of intelligence activities like research, planning system development, etc. (i) Resolving conflicts between hierarchical levels, (ii) coordinating and directing functional substructures, and (iii) coordinating external demands and organizational resources, needs, etc. constitute managerial functions in the conversion process.

*Structure* represents the relationship among the various functions or the activities in the organization for the efficient achievement of its goal. It "can be compared to the skeleton structure of animals – it provides the basic framework around which the various parts or units are related and function". (Johnson et al. 1973: 32). Simon holds, "the organization structure establishes a common set of presuppositions and expectations as to which members of the organization are responsible for which classes of decisions; it establishes a structure of sub-goal to serve as criteria of choice in various parts of the organization; and it establishes intelligence responsibilities in particular organization units for securing specific parts of the organization's environment and for communicating events requiring attention to appropriate decision points" (Simon 1960: 10). In short structure highlights who is, where, why, and how in the organization. It makes clear distribution of responsibilities and authority in the organization through horizontal and vertical division for having the total work done. *Hierarchy* refers to the vertical division of authority and responsibility in the organization structure, while *departmentalization* refers horizontal functional division. *Span of control* is one of the basic criteria in setting hierarchy and establishing various departments. There are *line* and *staff* units in the structure, one directly related to the goal accomplishment activities and the other assists the former by providing technical and other supports; committees meant for special purpose also constitute an important part of modern development organization.

Personnel make the structure operative in the system. They are recruited in the organization on the basic of a service and salary structure. Conversion is the interaction between structure personnel for converting inputs following some process/procedures to have desired outputs.

System of recruitment and nature of appointment, permanent and temporary, salary and incentive structure, motivation, and manpower development process within the organization determine the quality of personnel in the system. Conversion process always requires an efficient personnel management system.

A set of processes consisting of some procedures and methods establish linkage between structure and personnel and make the organization operative. These centers round two broader issues of with inputs – *planning* process and *implementation* process. "Plan is a specific documented intention consisting of an objective and an action statement represents the means to that end" (Kreitner 1987: 148). Plan explains *what*, *when*, and *how* something is to be done in the system. Planning is the process by which the system adapts its resources to changing environmental and internal forces (Johnson et al. 1973: 49). Planning is an integrative activity and is not an end in itself – "its purpose is to provide the guidelines necessary for the vital decision making processes throughout the organization" (1993: 54). It decides in advance what is to be done and how is to be done. *Futurity action* and personal or organizational causation are important elements in any plan (LeBreton and Henning 1961: 7). Information is the basic input in any planning process. The development organization for initiating planning process needs sufficient and accurate information regarding demand, support, opposition, and the availability of resources needed for development action. Plans for repetitive and non-repetitive problems are different. Plan may be strategic middle range or short term in nature. Development efforts require various types of plans to face the contingent forces.

Plan is materialized through a complicated process of implementation. The necessary aspects of implementation process are *communication*, delegation coordination/integration, supervision, control, monitoring, and evaluation. The field-level staff and structure of development organization shoulder the ultimate responsibility of implementing development plants, programs, and project. The need to be communicated the message regarding development actions as visualized in the planning/program documents. Delegation of adequate authority and supply of necessary inputs are two prerequisites for their action. Various units at the implementation level, following the principle of differentiation and specialization, work separately to achieve the segment of planned object. Only through integration and coordination there outputs can effectively achieve the desired goal of development. Through division of work, some forces of disintegration in the system always develop. Coordination upholds the forces of integration to achieve the integrative goal of development. The conversion process takes place in a dynamic environment which deviates the time of action from the desired one. Henri Fayol defines "control consists of verifying whether everything occurs in conformity with the plan adopted, the instructions issued and principles established. It has to point out weaknesses and errors in order to rectify and prevent recurrence" (Fayol 1949: 107). Control function "provides adjustments in conformance to the plan; the maintenance of variations from system objectives within allowable limits" (Johnson et al. 1973: 74). Rebert Mockler comprehensively defines control as systematic effort "to compare performance to predetermined standards, plans or objectives in order to determine whether performance is in line with these standards and presumably in order to take any remedial action required to see that human and their corporate resources are being used tin most effective and efficient way possible in achieving corporate objectives" (Mockler 1970: 14). In the process of developing program implementation, control mechanism occupies the most vital position; the development process is not desirable by some of the forces who prefer status quo, not developmental change. At the time of this opposition, development process may deviate from the proper way of handling inputs meant for development. Control mechanism constantly tries to protect this deviation.

*Monitoring and evaluation* of the performance of the implementing actors are two other activities in the system of conversion process. These two are also used as instruments of control mechanisms.

Participation of actors and beneficiaries in the process of development both at planning and implementation stages has been a widely accepted phenomenon which is necessary to formulate realistic plan and effective plan implementation. Effectiveness of developmental organization largely is affected by its capability to ensure participation.

Conflicts and contradictions are most common phenomena in any complex organization that may

originate act of personal, structural, and procedural reasons. In the conversion process, Sharkansky observes "Conflicts between the formal rules of the organization and the personnel values of the administrations clashes among administrators that increase problems in making agency outputs; decision makers' use of routine procedures to simplify complex and numerous inputs; an tendencies towards rigid maintenance of the status-quo in the force of innovative demands. An agency's leadership and staff may disagree about proper salaries, working conditions and services to the agency's clients" (Sharkansky 1975: 8). There are informal groups in the social organizations. The differences among these groups in respect of their goals and organizational goal also produce conflicts and contradictions in the conversion process.

## Outputs

Outputs that conversion process discharges to the environment include "services, tangible goods and behavioral regulations, plus gestures, and activities that the give symbolic messages to those who are tuned in" (Sharkansky 1975: 9). Outputs help the system to achieve its goal. This falls within two broad categories: *goods* and *services*. The outputs of development efforts ensure directly the supply of goods to the beneficiaries or create congenial scope for them so that they themselves can produce goods required by them. Effectiveness of the outputs of the efforts depends on their capacity to face the development demands of the incumbents, minimizing opposition of the environment. It is measured by the process of evaluation.

## Feedback

Feedback represents the influence of earlier outputs upon the demands, resources, support, or opposition, i.e., up inputs that the system receives (Sharkansky 1975: 17). Feedback mechanisms are evident in the continuity of interactions among development actors and the many sources of their inputs and the recipients of their outputs. The continuity of the development process is carried on by the feedback mechanism. This feedback may be positive when it satisfies the target and negative when paradoxes remain between expectation and outputs. Development efforts need multidimensional feedback mechanism to get proper assessment of the output and goal achievement. Negative feedback is more important to the conversion process for its adaptation with the development need. "When a system's negative feedback discontinues its steady state vanishes and at the same time its boundary disappears and the system terminates" (Miller 1955: 529). Functionally the outputs constitute the boundary of the system. It disappears when the conversion process collapses at the advent of the total rejection of environment to receive system outputs.

## Environment

Environment is very important to any system. Development system not only takes input from and discharges output to the environment, but also influences the environment. Environment is dynamic, and the system of development efforts must cope with the changing environment. Shirly Terreberny argues that environments are becoming more *turbulent*. There are accelerating rates and new directions of change in that the system must be able to adapt to this turbulence in order to survive. Environmental factors are a source of change as well as a source or cause of existing conditions (Hall 1974: 297–298). Environment is a compact network of relationship of enormous issues and entities by which any organization is surrounded. Considering this reality "organization can be thought of as a subsystem of the broader socio-cultural environment in which it operates" (Johnson et al. 1973: 508). Development efforts always strive toward the change in relationship network of the environment to remove the odds of underdevelopment. There are several issues and elements in the environment development administration. Hall discusses two types of environment: *general* and *specific*. The first contains those general conditions that must be

**Development Administration from System Perspective, Table 1** Various issues related to the system of development efforts/administration

| No. | Systems variable | Main constituents of the systems variable | Aspects related to the constituents of system variable |
|---|---|---|---|
| 1. | Input | a. Demand | Socioeconomic status of the people |
| | | | Dimension and nature of under development |
| | | | Need for development |
| | | | Sociopolitical ideology |

of concern to all organization – social, economic, political, legal, demographic changes, etc. "The second category contains specific environmental influences on organization such as other organizations with which it interacts or particular individuals who are crucial to it" (1973: 298). William Dill from narrower perspective defines it as *task environment* which refers to those elements in the environment that are relevant or potentially relevant for organization (Dill 1958: 409–443).

The environment that is most relevant to the system of development efforts is the sociocultural and economic condition in general which upholds the overall demand for development. The other three important elements with which it always interacts specifically are the beneficiaries, government, and donor. Beneficiaries are the object of development as well as actors when participation and sustainability are concerned. Government provides legal basis for development action and regulates and directs the same as the protector of popular interest. In the developing countries where internal resource mobilization cannot alone ensure development finance, donor's role still remains vertical in the process of development change initiated either by the government or by the nongovernment administration which refers to its relationship with the government, donors, and beneficiaries within the broader socioeconomic spectrum (Table 1).

## Conclusion

This framework of development administration the system depends on the various issues like the extent to which the system can uphold the different characteristics of open system in coherent manner and the functional arrangement of the interacting subsystems within the system. Importation of inputs, conversion process, exportation of outputs, and feedback constitute the most important functional characteristics of any system. Besides these other important characteristics including negative entropy, coding process, steady-state and dynamic homeostasis, differentiation, and equifinality as mentioned by Katz and Kahn determine the efficacy of the system operation (Katz and Khan 1978: 42). Development administration system must move to arrest entropic processes that always threaten development initiatives in the developing countries, so the system must acquire negative entropy, the means, and strength to encounter the same. The system must procure information input and receive negative

feedback. Coding process in this regard plays the most vital role. It refers to a framework within which the system will accept or reject any inputs. It is a basic element related to the perspective of development efforts. If any development administration system fails to develop, sustain, and use its coding process, it has every chance to derail from its goal. The development administration system must uphold dynamic equilibrium in its operation and proper balance with the dynamic environment without sacrificing its core values and compromising with the objective of development. It needs to exhibit the characteristics of differentiation efficiently and effectively. For its successful achievement of goal, it must follow or uphold the principle of differentiation and must keep in mind that a system can reach the same final state from differing initial conditions and by a variety of paths. All these characteristics do not automatically become operative in the system rater they essentially depend on the subsystem arrangement and functioning of the later.

## Synonyms

Authority; Control; Rule

## Definition

"Development administration" is the administration of policies, programs, and projects that contribute to the development of a nation. Development administration has a broader impact than public administration since it is suggested that this kind of administration has significant sociopolitical and socioeconomic impact on the countries involved.

## Development Administration as a Concept

### The Concept and Elements of Development Administration

Public administration as a concept is not new, and some suggest the term "administration" predates back to the earliest forms of civilization. Farazmand (1996), for example, suggests that it is old as civilization itself. However, the term itself became part of the wider academic discussion when Woodrow Wilson (1887) suggested that, unlike the broader discipline of political science, public administration was a *detailed and systematic application of law*. Gulick and Urwick (1937) later expanded the term to include of *all those operations having for their purpose the fulfillment or enforcement of public policy*. While the debates in the latter half of 1800s and early 1900s centered around issues of the loci (where) or foci (what) of public administration or whether it should remain as integral part of political

science, it was evident, however, that public administration could not be a tool kit of "one size fits all." In other words, particularly after World War II, it was argued that public administration as a mechanism for achieving the goals of administrators had to be adjusted to suit a specific environment. Accordingly, by the 1960s, a Comparative Administration Group (CAG) sponsored by the Ford Foundation, led by Frederick Riggs, was established. Emerging out of this research was the proposal to view public administration in various countries through *prism* or *lenses*. Hence, what emerged was the theory of the *prismatic society*. Unfortunately, by the 1970s the research was discontinued due to a lack of funding.

The work of this group had a lasting impact on the development of the discipline of public administration. As more and more countries attained independence, it was found that the "traditional" public administration was limited in its scope and premise, the core of which was strict adherence to laid-down rules and hierarchy. Two terms were introduced and then used interchangeably – administrative development and development administration. The concept and meaning of the two terms, however, differed significantly. The first term connotes the mechanisms by which administrative institution is developed or improved. The second, development administration (1950s), suggested new aspects of public administration which were needed to carry out policies, projects, and programs in order to improve the social and economic conditions of the ex-colonial territories. It should be recalled that "new" described a number of features including newly established political structures, new institutions, practices and regulations which were juxtaposed with old traditions and behaviors, and newly elected politicians who now replaced the former colonial administrators. In addition, the infrastructures of many of these countries were poor, and services such as the delivery of potable water, access to education, governmental services, transportation, and even sewerage disposal were minimal or nonexistent in many areas within these countries. Poor infrastructure, limited access to health care which resulted in a high level of maternal and child deaths, as well as the spread of a number of infectious diseases were all challenges in these societies. The levels of literacy were also high, and in many countries there was a high rate of unemployment. It was evident that even though the former administrators had endeavored to train or "West Indianize" some of the local administrators to take over the mantle of administration of the country when they left, to a large extent, their emphasis on law and order, stability within the countries, and the maintenance of the status quo did little to prepare the new nations to take over the mantle of political power far less economic independence.

## The Features of Development Administration

The focus on development administration thus expanded on the elements of the old public administration model which was premised on the basis of accountability, scope, authority, and communication. Since these "developing" countries were now confronted with rapidly increasing populations whose expectations were high, the emphasis for the administrator was now on results. It was felt that every development function should have a defined objective. A critical element of development administration was the focus on the bureaucrat. Under colonial administration, the bureaucrat was envisaged as part of a "cog" in a larger wheel. The typical bureaucrat adhered strictly to the ideals of the bureaucracy as outlined by Weber in 1925. These ideals included:

- The emphasis on rules, regulations, and procedures.
- The separation between the public and private sphere – in other words the neutrality of the bureaucrat.
- A hierarchical organization where the span of control was limited and there was a series of subordinate and superordinate positions.
- Knowledge resided at the top of the organization and communication flowed from the top to the bottom. In other words, there was little scope for discussion or the proposals of new

ideas from the rank and file within an organization.
- There was a strict reliance on files, which meant that individual cases that did not fall within the "norm" were not considered.
- Officers were promoted on the basis of seniority or what was termed "the knowledge of files."

In the "developing" countries, however, it was felt that in order to bring about change or development, the bureaucrat had to be transformed into a "leader." New attributes were required of the leader. One of the critical attributes was that the leader had to be visionary. In other words, the leader had to recognize the strengths and weaknesses of the organization or the country and should have the vision or the foresight to establish systems by which to achieve set goals or objectives. Implied in this "vision" was the idea of *innovation*. An innovative approach was a dynamic approach which encouraged new and better ways to achieve objectives. One of the implied attributes of the administrator/bureaucrat/leader was the need to foster *inclusiveness*. The concept of inclusiveness to the Western world suggested the need to understand the needs of the country as well as the requirements of the wider population within the society and not merely one group. This attribute was critical in the newly independent territories particularly in societies in which there were a number of *transplanted* populations, such as Trinidad and Tobago, Suriname, and Guyana. Inclusiveness, many suggested, was thus "people centered" and not "group centered."

A major aspect of development administration was its focus on planning Williams (2002). In introducing planning, however, what was surprising was even at this period, short-, medium-, and long-term goals were emphasized. According to Gant (1979), in order to achieve development administration, new and reoriented agencies along with new management systems and processes should be introduced. Accordingly, he suggested that these agencies should include planning boards to facilitate decisions about development policies and the allocation of resources toward the accomplishment of those policies (Gant 1979: 24). He also proposed the reorientation and strengthening of nation-building departments or ministries to accommodate development. This, along with the introduction of competent planning in the central ministries and departments, he felt was a key factor in reorienting and strengthening the nation-building departments upon whom the diverse burden of development fell. Yet, there was some dissent, it seemed, from the politicians. Indeed, Eric Williams, the first premier (1956) in the twin-island Republic of Trinidad and Tobago, noted that *national planning is from start to finish a political process- a process that can be initiated and carried through only by politicians, who are undoubtedly the main actors in the planning drama, however big a role can be played by other actors such as administrators, the private sector and the labour movement*. The message was quite clear – the politician was the one in charge.

## The Challenges in Introducing Development Administration in Ex-colonial Societies

While the ideology of development administration was sound, there were numerous challenges that stymied its implementation. One such challenge, particularly in the case of the Anglophone Caribbean, was the conflicts in the relationships of the politicians and the senior administrators. According to G. E. Mills (1977: 265), *the initial stages of the introduction of ministerial government and the transfer of power from the colonial office and the governor were accompanied by friction, mutual suspicion and conflict between civil servants and the new ministers*. He noted that this problem stemmed from a number of sources but primarily from deep social, psychological, and historical roots which were brought to the surface by the transfer of power. He suggested that the older officials were conditioned by the colonial system, and some officials, as the heads of departments, were accustomed to performing powerful roles as policymakers. Thus they resented the intrusion of the new group of elites, some of whom had little formal education and thus were considered ill-equipped to undertake the responsibilities of government. But it was

not only the conflict between the ministers of government and the civil servants that were to present challenges. Rather other challenges that emerged were the instability of the politicians, some of whom served for a term of 5 years. Five-year terms, it was argued, meant that many of the policies introduced were often short-term rather than long-term plans. Another issue that surfaced and was inherent in small states where everyone knew or was related to someone within the society was the high degree of political interference by the politicians. It was particularly prevalent in the filling of vacancies as well as funding of projects.

One key issue, too, was the overcentralization by the central planning agency. According to Rodman (1968: 13), *whatever the location of the central planning agency, the most frequent complaint about the organization is that of overcentralization. This embraces both the failure to 'deconcentrate', i.e. to delegate powers to middle and lower echelons at the centre, and the failure to 'devolve' powers to local administrators*. Another challenge also was that of the system of budgeting. Rodman (1968: 14) notes: *Moreover, the budget process, by its nature, tends to act as a restraint; its officials are inclined to adjust programmes to available resources rather than try to secure resources (e.g. by tax reform) for financing desirable programmes. If the planning agency is politically out-weighed by the budget bureau, or if the planning unit is part of the Ministry of Finance, the forces of restraint may prevail. The budget itself should serve as a control on the quality of projects, and as an authoritative commitment of funds. Too often, however, premature and ill-conceived projects slip through and the budgets are subject to endless approval. Year round* ad hoc *expenditure control is often resorted to as a substitute for good budgeting, and this is a negation of programming and planning*.

## Conclusion

However, one issue that remains key to the idea of development and in fact hinges on the notion of inclusiveness is the question of whether the administrator, in small societies, could actually divorce personal interest from public interest. Indeed, some have argued that the challenge lies with the administrators who are self-serving rather than displaying neutrality in the delivery of public service. While the call for development administration was prevalent in the 1960s, much of these challenges persist today and include questions of the relationship between the politicians and the civil servants, the challenge of devolving power, budgetary concerns, conflicts between groups, and the reluctance to change practices and procedures. Many therefore argue that development administration is ongoing.

# Development Assistance, Networks, and Community Self-Help Development

Manoj K. Shrestha
University of Idaho, Moscow, ID, USA

## Synonyms

Community development; Network building; Network structures; Networking; Self-sustaining communities

## Definition

Networks are relationships between actors. Network structures are emergent patterns of relationships resulting from relationships among actors. Community self-help development is defined as activities pursued by communities for their well-being after the development assistance is complete or external funding has ceased.

## Introduction

Many communities or neighborhoods face challenges in getting ahead. They need outside assistance to address those challenges. At the core of community development assistance is to help communities to help themselves. The most successful development assistance is one that produces effects far beyond the confines of the assisted project itself (Goldin et al. 2002). Many development assistance programs include capacity building measures as part of the assistance so that the recipient communities move toward self-help development. This entry discusses the relationship between development assistance, network building, and community self-help development. It argues that network building plays important mediating role between development assistance and self-help development of communities. This involves specific ways communities structure their relationships with organizations.

## Development Assistance and Network Building

External resource dependence is common for many communities. Communities hardly possess all the resources they need to successfully plan and implement community development projects on their own. These resources include funding, expertise, information, or political support, for example. Even when communities receive outside assistance for their projects, more often they are required to do their part which can range from arranging the matching funds to soliciting technical expertise or political support. Besides, the assistance is temporary; it ceases once the project is complete. Therefore, it is paramount that a community, aiming to get ahead, connect with various public, private, nonprofit, or community-based organizations operating at different levels to mobilize their support to purse community projects. These connections between communities and organizations develop into complex pattern of networked relationships.

Networks are formed as actors engage in network building – an act of creating relationships or ties with other actors. Creating ties involve choosing partners to create ties with. The choice of partners is influenced by the qualities they possess or the positions they hold in the network because of the presence of other ties. A focal actor may create ties with other actors to access resources they hold or to garner social capital such as trust or credibility of commitment needed to achieve coordination or integration of resources (Provan and Milward 1995). Besides, communities vary in network building capacity or in their ability to network in a certain social context, affecting their choice of partner organizations or the extent of network interaction. For example, some communities may be less outgoing or marred with internal conflicts, whereas others may lack enabling environment or skills needed to engage socially. Social skills involve communication skills, conflict resolution, participation, and treating others respectfully. Social environment includes the social setting, social institutions, power relations, and cultural norms and values that affect social interaction. Poor communication skills or absence of enabling public or private

forums, for example, can present significant barriers to interaction. Knowing how to initiate, respond, and react and how to adapt to the situation can significantly improve personal and professional relationships (Chaskin et al. 2001). Understanding the subject matter, processes, and the roles the potential partners play can prove important in building relationships. Similarly, a supporting social climate can significantly reduce the stress for actors seeking to engage in interaction.

Having collaboration and problem-solving abilities, planning and decision-making expertise, and relationship building skills are important aspects of community capacity (Chaskin et al. 2001). Many community development programs invest in capacity building measures as part of the development assistance to communities in the form of technical assistance, separate from the capital assistance meant for building physical assets. Although community capacity building measures are short-term interventions, they enable and grow long-term capacity of communities (Chaskin et al. 2001). Technical assistance to communities commonly focuses on providing formal and on-the-job training. Formal training includes interaction skills, conflict resolution, community engagement, record keeping, and collaboration and relationship building. On-the-job training includes planning, implementation and operation of the funded projects, organizing community meetings, and managing the beneficiary-elect Users' Committee, for example. These trainings incorporate leadership development, organizational development, community organizing, and fostering collaboration among organizations considered crucial for building community capacity (Chaskin et al. 2001). The premise is that the communities with exposure to capacity building measures will engage in network building to mobilize resources not only to complete the assisted project but also to pursue self-help activities after the assistance ends.

## Network Building and Community Self-Help Development

Two questions of interest in this regard are: Do communities pursue self-help development? How do communities structure their relationships with organizations to pursue self-help development?

### Community Self-Help Development

Public investment programs have potential to create spin-off effects. For example, highway projects not only improve vehicular traffic flow but also create opportunity for the development of towns and businesses. Childcare programs not only help development of a child but can also save time for parents to earn income. In the context of community development assistance programs, the recipient communities are expected to transition to self-help development rather than continue to depend on the assistance. In fact, many communities take up new projects to meet their unmet needs after competition of the publicly funded project. In many developing societies, such needs include school building, irrigation channels, farm roads, bridges, electricity, and community centers, for example (Shrestha 2020).

These offshoot or spin-off projects initiated by the communities after the completion of initial assistance are self-help development projects. Community self-help development is a process in which communities are in charge of their own well-being. The process is triggered by positive experience of or the skill and confidence gained from the implementation of the externally funded project. Self-help development is a behavioral shift in communities, from being rowed by others to rowing the community by themselves, which can be measured by the number of post-assistance projects pursued or the amount of resources mobilized by communities from organizations they have had contacts with (Shrestha 2020).

### Structuring Relationship for Self-Help Development

Network setting and the problems the communities trying to resolve affect how communities structure their relationships with organizations in pursuing self-help development. The network setting constitutes two sets of actors: communities and organizations of various types. These are heterogeneous organizations including public, private, nonprofit, and community organizations operating at different levels with their own functional jurisdictions (scope), authority, and

resources they command. No single organization holds all the resources and authority the communities need; rather, polycentricity, or multiple independent centers of authority or power, is the norm (Ostrom 2010).

Communities initiate contacts with organizations to mobilize resources to pursue self-help projects. Successful execution of self-help projects demands effective coordination and integration of organizational resources. They may also face credibility of commitment problem; that is, organizations may deviate from or may not live up to their commitments. While contacting organizational partners involves a choice as noted earlier, the choice is also affected by the communities' need for resources as well as the challenges they face in coordinating the mobilized resources and in getting assurance that resource commitments are fulfilled. In doing so, given the costs of creating or maintaining ties with organizations, communities evaluate the existing ties with organizations and decide to connect with organizations to form specific configuration of ties that help them resolve the challenges. The communities can use centralized coordination and closure-based coordination in their relationships with organizations to address the challenges.

## Centralized Coordination

Centralized coordination occurs when communities actively reach out to multiple organizations to mobilize resources. Since communities can pursue multiple self-help projects of different types, they would be better off in mobilizing resources when they connect with a broad range of organizations willing to cooperate. In this community-organization network, the community occupies the central position and is expected to mobilize greater variety or amount of resources when its network size or the number of organizational contacts (i.e., degree centrality) is greater. Given that resources are held by different organizations, the community, being in the central position, can improve implementation of self-help projects by reducing fragmentation of resources, by enhancing communication and coordination between organizations in the mobilization of resources, and by integrating the mobilized resources (Provan and Milward 1995).

Coordination in the delivery of resources is especially important when the community is in search for various resources and the resources are disbursed across various organizations. Moreover, most organizations have narrow mission. They only support projects that match their mission. In this situation, the communities will do better when they have ties with many organizations, allowing them to cast a wide net to mobilize resources. Coordination of various organizational resources is also more efficient by a leading community instead of individual partner organizations devoting time and effort to coordinate the support they provide. By implication, having ties to many organizations helps the communities reduce dependency on any one organization as they will have option to fall back on another organization for help in case one organization chooses to withdraw its support.

The greater the number of organizations contacted by a community, the higher the community's degree or degree centrality (see Wasserman and Faust 1994). A community having ties with many organizations (i.e., a "star-like" network) is more active and can mobilize more resources than a community that is less active or has ties with few organizations. Because communities vary in size and socioeconomic status, their scope and extent of unmet community needs also differ. These differences are expected to reflect in varying levels of demand for organizational supports and, thus, the number of organizations they contact. Hence, at the network level, one would expect different communities having contacts with different number of organizations. The distribution of communities' degree centrality with organizations in a network, measured by degree centralization (see Wasserman and Faust 1994), can be highly skewed; that is, one or few communities can have contacts with large number of organizations in the network. In that case, community degree centralization score would be high. But when there is less skewed distribution of communities' degree centrality, then community degree centralization score would be low. There is substantial evidence for positive association between network size of actors and direct outcomes of public programs. But there is limited

evidence regarding post-project self-help development activities. In the case of rural communities in a developing country, Nepal, communities' degree centrality was found to be correlated with the number of post-assistance self-help projects they pursued (Shrestha 2020).

## Closure-Based Coordination

Closure-based coordination occurs when closed groups are formed in which each member of the group is linked with every other member. In a network between communities and organizations, a closed group would mean two or more organizations sharing at least the same two communities. Note that networks involving two sets of actors such as communities and organizations are called two-mode networks. In such networks, the basic form of closure is a four-cycle which is formed when an open three-path consisting of two nodes of one type and two nodes of another type is closed by a fourth tie (Wang 2013). In networks involving the same set of actors, called one-mode networks, the basic form of closure is a triangle which is formed when a two-path or an open triangle is closed by a third tie. Assumed to be cohesive, a closed group of organizations supporting the common communities is more conducive for coordinated supply of different organizational services. When organizations support a common project but commit different resources, coordination is required to effectively pursue the shared project. The partner organizations' interests to see that their support is helping the communities encourage them to work together. A cohesive group allows the member organizations to communicate with each other, resolve differences, and plan together for the benefit of the shared project. A community's ability to organize projects increases with greater coordinated support from the partner organizations. Closure networks can also help build group solidarity and trust among the members of a group. Greater trustworthiness can encourage other actors to join the group. In this scenario, actors in collaboration are less likely to shy away from commitments because rapid flow of information within the group allows the members to watch each other's actions, encouraging them to honor their commitment (Coleman 1998).

Cohesiveness also creates disadvantages. Tightly knit groups suffer from redundancy of information as the same overlapping information travels within the group. Closed groups also place constraints on actors, preventing them from accessing diverse perspectives, resources, and skills valuable to their success. Moreover, cohesiveness tends to encourage groupthink. When communities value new information over partner coordination, links to a cohesive group of organizations can limit their ability to successfully pursue self-help activities. Access to new knowledge is possible through bridging ties between two unconnected actors or groups serving as bridges or weak ties (Granovetter 1973) or filling structural holes (Burt 2000) between the two. Bridging ties provide information advantage to actors because sources of information are additive than overlapping. For example, a community looking for ideas to resolve local disputes can benefit from the experiences of other communities that faced similar issues in their projects.

Network closure and bridging (i.e., open-path network) are often considered an opposite phenomenon (Burt 2000). The more closely knit a group is, the less open it will be for outside connections and vice versa. In this sense, closure and bridging involve trade-offs. Closure implies dense ties among organizations, whereas bridging implies sparse links among organizations. In that case, communities' preference for network closure or bridging is expected to depend on their need for coordination among partner organizations or for new information when pursuing self-help projects. However, it is possible that communities seek balance between partner cohesion and bridging ties to secure program funding for their projects (Shrestha 2013a).

In the case of communities as collectives, closure and bridging can also be conceived in terms of ties within a community among community members and of ties outside the community with organizations. Woolcock (1998) argued that coordinating community economic development efforts entails collective action problems, warranting communities to be able to draw on both bonding and bridging ties. Bonding ties, or

having high degree of density and closure, among members within a community help it to get by, whereas bridging ties with wide-ranging links to heterogeneous organizations that go beyond the community are essential to get ahead. This suggests additive relationship between centralized coordination and closure-based coordination. Trade-offs between internal cohesion (bonding) and external contacts (bridging) are possible. Communities with greater internal conflict (less bonding) tend to use more wide-ranging contacts with outside organizations for securing funds for their projects (Shrestha 2013b).

## Conclusion

Network building is important in pursuing community self-help development. It plays a mediating role between community development assistance and self-help development. Mobilization of resources from organizations and coordination and assured supply of those resources are critical for successful implementation of self-help projects. Communities can achieve this by building wider network of organizations and by developing closure network among partner organizations. The former allows the communities to be in charge of coordinating organizational supports, whereas the latter allows the partner organizations to work together and to maintain credibility of the commitments needed for the success of the shared projects. Determining why and how communities engage in network building is crucial for understanding their motivations and the underlying organizing principles they follow in structuring relationships with organizations. This also highlights the importance of including network building as part of the design and evaluation of community development assistance programs. These insights can also be valuable to public managers looking for ways to modifying network behavior for sustained impact on communities beyond development assistance.

# Development Governance

Neetu Choudhary
A N Sinha Institute of Social Studies, Patna, Bihar, India

## Synonyms

Development administration; Development management; Development policy

## Definition

Although governance may pertain to all types of organizations – whether social or political, private or public – in context of development, it typically implies governance by the State through its various constitutional powers and obligations. As such, development governance simply means the process and manner of governing the development of a given administrative and/or geopolitical unit. It is a broad term that encompasses whole policy process vis-à-vis development and its participants. In its 1992 report entitled "Governance and Development," the World Bank defined [good governance] as "the manner in which power is exercised in the management of a country's economic and social resources for development" (IFAD 1999). In context of development, the same definition implies that development governance is governing of social and economic development through appropriate mechanisms including policy making, program design, budgetary allocation, and administrative reforms corresponding to long-term priorities, medium-term goals, and short-term and/or annual targets set for social and economic development. This process is led by the State as mediated by collective action of various stakeholders. Thus, development governance is necessarily a political issue.

## Introduction

Although governance has always been in practice at some level or the other, the term has invited particular interest during last three decades. Emergence of neoliberalism as the dominant force tended to minimize the role of state. Alongside, the popular discussion began to speak more of "quality government" than "all government." This implied that in a liberal economic framework scope for government interference should be limited and it is the "quality" of the government that should be the prime concern. Quality of governance in turn highlights the instrumental role of government, i.e., it means a manner of governance that facilitates efficient implementation of market reform through effective political institutions. According to Britannica encyclopedia – "the term governance can be used specifically to describe changes in the nature and role of the state following the public-sector reforms of the 1980s and 1990s. Typically, these reforms are said to have led to a shift from a hierarchic bureaucracy toward a greater use of markets, quasi-markets, and networks, especially in the delivery of public services."

Thus, the current governance discourse actually aligns with the discourse that looked into the question as to how much government interference can be acceptable in a liberal economy. To reiterate, this notion of governance is preoccupied with the economic aspect of governance that sees state's role as limited in relation to market. As such, governance today literally represents "economic governance." But with continued human and international development challenges such as hunger, malnutrition, illiteracy, etc., the boundaries of governance is specifically reconstituted to address such issues that market cannot take care of. Thus, now development governance can be understood as the extended term to capture this definition of governance.

This approach on development governance got impetus from international development organizations, which came to support less developed and developing countries in their fight against some of the development challenges listed above. Their technical and financial support and aid mostly come with their recipe for good development governance. While on one hand global forces pushed the state for minimal interference in market mechanism, on the other they expect the state to indulge in good development governance. The latter in terms of the World Bank and the United Nations Development Programme also means supporting donor agencies work through enabling the civil society. The UNDP (1997) even conceptualized the empowerment of civil society as the true guardians of democracy and good governance everywhere. This simply means that the state has to depend upon and partner with various stakeholders – national and international civil society – to fulfill its various development goals. Clearly, the governance approach, as Stoker (1998: 17) puts it a "new process of governing, or a changed condition of ordered rule; or the new method by which society is governed."

### Governance, Good Governance, or Development Governance

The way the discourse on governance got impetus during late 1980s onwards, inherently carried the notion of governance or good governance for development. Since many countries in the Global south, i.e., many developing and less developed countries of the world continued to remain entrapped in low and very low growth rate and high poverty, the incumbency of neoliberalism attributed this to too much government interference. It was held that development requires limited but good government and rest can be taken care of by the market. Therefore, practically good governance is governance that facilitates efficient functioning of market in partnership with other stakeholders in a way that various development goals may be achieved. Apart from limited role for state, this clearly calls for participation from other stakeholders of development. This emphasis on participation is co-terminus with the emergence of the rights-based approach to governance. The era of Millennium Development Goals and now Sustainable Development Goals has been founded on the philosophy of right to development wherein governance is considered the most important requirement for achievement of these goals. Such governance in turn is based on efficient and effective administration, and elimination of corruption is certainly an important component of good governance. The framework of development governance converges with that of the neoliberal agenda of free market as well as with the international development agenda. This is why this term is so much in vogue. In fact, growth and development are key factors pushing for governance today.

## Is There a Theory on Development Governance?

The evolution of a theory on development governance necessarily has to be linked to theory of administration. This is because "governance" as a way to govern is a relatively new way to look at administrative processes. Administrative theories have to be understood against the socioeconomic background and historical time period of their existence (Bhattacharya 1996). As such, development governance is a product of contemporary global structure of economy and the willingness of nation governments to adopt this structure. The bureaucratic systems of government that Max Weber and Woodrew Wilson dealt with are no longer the dominant forms. Weber's formulation on bureaucracy continues to influence theoretical paradigm on administration, but various other organizational theories have been found to be helpful in explaining how organizations including government functions. These theories have evolved through continuous interdisciplinary interface.

### Traditional Organization Theories on Administration

This theory adopts an orthodox approach and speaks of one best way of structuring organizations. With its focus on physiological and mechanical aspects of work organizations, this theory is also referred as closed system approach. There are three dominant schools under universal design theory (Bhattacharya 1996):

(i) Scientific management: This approach was concerned with organizational efficiency and focused on the aspects of planning, standardizing, and improving human effort at the level of works, so that to enhance productivity and efficiency. There was so much emphasis on efficiency that mechanisms were also developed to measure the progress of work against time. The separation of planning and execution was a basic tenet of scientific management theory. Since the theory laid too much emphasis on efficiency at operational level, it witnessed resistance from labor groups and leaders.

(ii) Classical theory of management: Unlike the scientific management theory, which focused on operational level, the classical theory of management adopted a broader approach towards formal organization, structure, and the basic management process. Earlier thinkers of this school believed that knowledge of administration rather than technical knowledge is needed at higher organizational levels. The classical theory

focused on division of work, centralization, stability of tenure, and equity among others. The classical theory is also known as administrative management theory. The classical theory was criticized by the behavioural scientists as too mechanistic and incompatible with human nature (March and Simon 1958).

(iii) The bureaucratic theory: Although scholars like Marx and Hegel have written on bureaucracy, Weberian bureaucratic model continues to dominate administrative theory. Max Weber linked the growth of bureaucracy with the emergence of post subsistence economy. This was so because the market (capitalism) would need administration for security and facilitation of its market based activities. Weber also laid emphasis on the role of middle class and its demand for democracy as a prerequisite for development of bureaucracy. Weber situated the model as a sociological phenomenon in his theory of domination (Nicos 1975). Domination refers to power relationship between people and when exercised over a large number of people, requires a pool of administrative staff which is to be provided by bureaucracy. This domination draws legitimacy through charisma, tradition, or law. Weberian model is ideal type, draws authority by law, and is defined by structural characteristics such as value neutrality. Bureaucracy should be considered as an "organization that maximizes efficiency in administration or an institutionalized method of organized social conduct in the interest of administrative efficiency" (Blau 1956).

### Behavioural and System Theories

These theories were led by behavioral science which has been defined by Berelson and Steiner (1964: 10) as "the disciplines of anthropology, psychology and sociology – minus and plus: Minus such specified sectors as physiological psychology, archeology, technical linguistics, and most of physical anthropology; Plus social geography, some psychiatry, and the behavioural parts of economics, political science, and law". In short, these theories are concerned with the scientific research that deals directly with human behaviur.

(i) Behavioral approach: This approach was led by the human relation approach which emerged from a series of studies conducted between 1927 and 1932 undertaken by researchers from the Harvard University at the Hawthrone Plant of Western Electric Company at Chicago (Bhattacharya 1996). While the human relation thinkers agreed with the traditional theorists on the crucial importance of management in production, their basic approach was to see organization as a social system consisting of individuals and several informal groups functioning alongside the formal structure. Chester Barnard, Carld Rogers, A H Maslow are among the leading scientists under this approach. Barnard in particular is known for his equilibrium theory of organization, which suggests that organization sustains through the equilibrium between the contributions and the satisfaction of its members (Barnard 1938). He emphasized on factors like persuasion and cooperation to motive workers rather than coercion.

(ii) Systems approach: The systems approach evolved out of the need to understand organization as a holistic unit when various theories examined the organizational realities from different aspects such as structural, technological, socio-psychological, etc. General systems theory owes its origin to the biologist – Ludwig von Bertalanfly (see Blandberg et al. 1977), who underlined the fact that similar ideas have often been advanced in different subjects without an effort to synthesize them. This approach gives the opportunity to see organization as a "system," where many subunits are operational in constant interaction, thus influencing and getting influenced by each other to give way to a given system, i.e., an organization.

The systems approach is particularly relevant to understand complex public

organizations that have elaborate structures embedded in larger social, political, and economic environment. The systems view has helped the radical shifts in organizational thinking in the form of contingency or situation view that departs from the traditionalist view of "one best way."

– Situational theories: Constitute the modern approach to organization and underline the importance of dynamic interaction with environment and other situational factors influencing organizational design (Bhattacharya 1996). These theories are based on the premises that there can not one model of organization since changing environment changes situation in and around an organization, which needs a unique design. Technological changes and environment factors get particular importance in situational theories. Evidently, a stable environment may encourage the development of structured organization similar to "bureaucratic type." The systems approach argues that the survival or success of an organization depends upon its ability to adapt to the demands of the environment in which it exists.

## Economic Theories on Organization

### Public Choice Theory

The public choice theory is a branch of economic principles applied to bureaucratic organizations. This includes the application of microeconomics to social and political areas. This theory regards traditional public services as a source of rent seeking by the bureaucrats. Like market failure, public choice theorists speak of government failure, wherein government interventions do not produce desired results. The theory examines the functioning of government, bureaucrats, as well as the legislators. While analyzing the role of bureaucracy in government, the public choice theory also suggests ways to improve efficiency in government. This is possible through reorientation of public organizations towards performance and spending cuts. The public choice theory emerged during the 1950s but got widespread attention in 1986 when James Buchanan, one of the leading thinkers of this stream, was awarded with Nobel Prize for his contribution.

### Agency Theory

The agency theory has its roots in economics and business management. It then is used in an important stream of public administration research that has emerged using agency theory over time: political control of the bureaucracy. The most extensive application of agency theory in public administration has come in advancing the understanding of democratic control of the bureaucracy (Wood 2010). This theory is also known as principal/agent theory and deals with the dilemma when the agent has to make decision on behalf of the principals but the agency becomes preoccupied with its own interest in decision-making process. In the public sector, there is a difficulty to determine who the owners are and what their goals. Thus the accountability concerns become the main focus for the application of principal/agent theory in public sector (Hughes 2003).

## New Public Management

The theory of New Public Management (NPM) was inspired by varied theoretical perspectives briefed above. The need for a new approach to conduct public organization and services was begun to be felt since the 1980s. This was instrumental to the advent of the theory of New Public Management. United Kingdom has been the country of origin of the idea of new public management, wherein Hood (1991) based in his experience in UK coined the term NPM. NPM has also been represented as a cluster of ideas by David Osborne and Ted Geabler (1992) through their book titled "Reinventing Government." As reflected from the title of the book, the new public management sought to reorganize the functioning of government and its organizations along the values of service orientation and efficiency of a private sector organization.

As suggested by Osborne and Gaebler (1992), the governments should function in such a way as to,

- Be a facilitator
- Empower communities to solve their own problems rather than focusing on simple service delivery
- Encourage competition rather than protecting monopolies, be driven by missions, rather than rigid rules
- Be result oriented by funding outcomes rather than inputs
- Meet the needs of the people, not the bureaucracy
- Concentrate on earning money rather than indulging in indiscriminate spending
- Invest time and resources in preventing crisis rather than attempting to cure the problems
- Decentralize authority
- Solve problems by influencing market forces rather than creating public programs

As such, New Public Management is an umbrella term for a set of ideas, values, and practices that espouse for private sector and business approach to conduct organizational activities particularly service delivery. The new public management thus can be seen as a response to counter undesirable elements of civil services – the bureaucracy – particularly its rigid hierarchical nature, inflexibility, lack of accountability, and lack of ownership of public programs among others. This response includes a broad range of reforms spanning different echelon of government such as finance, banking, public enterprises, and so on. The arrival of economic reforms particularly imprudent fiscal management further highlighted the dysfunctionality in the civil services structure. The underlying presumption has been that private sector management techniques and market linkages can considerably enhance the efficiency and performance of public sector activities. With the establishment of the role of governance in development, the reforms sought through new public management were also endorsed by international organizations such as the United Nations agencies and what was propagated by them now was the importance of governance or good governance. The ideas thrown under new public management were now spread along with international development agenda after neoliberalism, and the role of development governance was systematically brought to the forefront.

From the above, it is apparent that the systems approach to organization and the public choice and agency theories together provided theoretical ground for the emergence of the theory and practice of New Public Management – the portent of development governance. As noted in the introduction, the concept of governance found predominance in response to the emergence of neoliberalism and globalization. This response rooted in the principles of new public management which with the support from the international agencies and other advocates, by mid-1990s, became a dominant paradigm in public management. The emphasis on development governance has been a coordinated articulation of what neoliberal forces and the international development agenda seeks from contemporary governments. Although, countries are hardly free from bureaucratic functioning, its domain has significantly cut down in many areas particularly service delivery. At the same time it has concentrated on facilitating business at ease. These shifts together reflect how as situational theorists would say, the nature of government changed while passing through various stages of bureaucracy to "governance" in current sense with changing economic and technological environment. With the advent of development governance, development administration lost much of its relevance since "governance refers to the development of governing styles in which boundaries between and within public and private sectors have become blurred" (Ewalt 2001: 10).

## Paradigm Shift in Public Administration: Evolutionary Linkages

### Traditional Administration to Development Administration

The evolution of Public Administration, as the institutionalization of administrative capacity for collective purpose (Caiden 1982), can be considered to be co-terminus with the evolution of human civilization. In its systematic and distinct form, traditional public administration has its

roots in nineteenth century, particularly during the appearance of the essay by Woodrow Wilson (1887) titled "A Study of Public Administration." Traditional public administration has had specific characteristics such as – dichotomy between politics and administration, value-neutrality, anonymity, one best way of doing things, rule-boundedness, impersonality, efficiency, rationality, and so on. Gradually, the traditional public administration, the focal point of which rested in the Bureaucratic Theory of Max Weber, was found to be too rigid, formalistic, and procedural inflexibility. Subsequently behavioral and human relation theorists came up with behavioral and systems approach to public administration (Barnard 1938; Maslow 1943; Appleby 1945; Simon 1946). This approach challenged the completely rational characteristics of bureaucracy as also the principles of administration and the idea of politics-administration dichotomy. The behavioral revolution established that the role of context is important and cultural factors also play a role in administrative setting.

Subsequently, a Comparative Administrative Group was founded in 1960 with grant support from the Ford Foundation which reflected upon the administrative needs of newly independent countries in Asia and Africa. The concomitant emphasis on third world countries gave rise to the subfield called Development Administration of which Fredrick W Riggs was the most noted scholar. Riggs discussed at length the varying context of under developed, developing (transition), and developed societies and emphasized upon their unique administrative needs. Administrative reform – in structure as well as behavior of bureaucracy – has been one of the core values of Development Administration in order to promote development activities.

## Development Administration to Development Governance

Development administration can be understood as direct government led effort to intervene in the processes of socioeconomic transformation. The idea of development administration was born at the juncture when many Afro-Asian countries emerged out of the colonial experience after the Second World War. Post third world war, many countries that emerged out of colonial government took to development administration to build their nations. The administrative system in countries like India inherited the colonial bureaucratic structure inspired by the traditional theories of organization which focused on efficiency. After freedom from colonialism, in many countries, the same bureaucracy was reoriented for implementation of development agenda. Thus, the law and order administration of precolonial era was converted into development administration. The term "development administration" is associated with an Indian Scholar Goswami, but it owes its conceptualization to Western scholars particularly the Comparative Administrative Group (CAG) in USA (Bhattacharya 1996). The purposes of development administration are to stimulate and facilitate defined programs of social and economic progress (Gant 1979). Even though the CAG was disbanded in 1973, Development Administration remained institutionalized in countries like India as an institutional mechanism to implement specific development goals set out in various public policies. Alongside in the USA, the Minnowbrook Conference of 1968 gave birth to New Public Administration (NPA), which refuted classical theories of public administration and called for client orientation, less bureaucracy, participatory decision-making, and decentralization among others. In India where the bureaucracy through development administration carried forward the government's development agenda, administrative reforms were sought through set up of various Administrative Reform Commissions. However, in practice development administration continued to be associated with self serving bureaucracy with rigidity in decision-making process and nexus with political power even though the need for efficiency and participation was well recognized. The critique of public administration in practice reached a new height in late 1970s and 1980s, and there was a collective assault on government's ways of doing things. Again the emphasis was on decentralization, business orientation, participation, etc. This collective assault was against the hierarchical nature of bureaucratic functioning and attempted to replace

development "being administered from top" by "being managed in partnership." This shift along with a thrust among the Public Administration scholars to align with the discipline of management led to evolution of New Public Management (NPM).

The NPM movement emerged in the United Kingdom to begin with but found immediate relevance in prevailing global context of structural adjustment and economic liberalization that needed efficient decision-making on and upon minimum government interference. Moreover, the ideas of NPM and reinventing government were essentially born out of the continuing search for solution to economic problems in 1970 and to produce a government that works better but costs less (Denhart 2004: 136). In less developed contexts, NPM was put forth popularly by development advocates in the form of governance. Although in the popular parlance, governance instead of development governance is the common term, in context of less developed and developing countries governance essentially means governance for development. The new economic regime came into a structural adjustment and economic stabilization package in the name of better development through minimum government. Hence, it spoke of governance that facilitates development through partnership with other stakeholders rather than the state itself. It is this transition that transforms development administration to development governance.

Unlike Development Administration that implied execution of development agenda through bureaucracy as the central tool (of course the bureaucracy was supposed to be oriented for this task), Development Governance implies institutionalization of a system wherein citizens, groups, institutions, and networks as society collectives articulate their demands and exercise their rights in pursuit of collective good. While under Development Administration, citizens looked up to bureaucracy for solution of various problems, under Development Governance, citizens are expected to resolve the issue with mutual partnership of which bureaucracy is but one member. Further, Development Administration is the responsibility of the state; Development Governance is the responsibility of all partners- state, market, and civil society. However, it should be noted that in most of the developing countries, the switch to efficiency and performance oriented administrative system begun with external pressures along with structural adjustment programs, which needed faster decision-making and simpler rules and procedures to promote private and foreign investment for which globalization opened ample opportunities. While countries have been vying to get greater share in global foreign investment flows, smooth business climate or "ease of doing business" – has been a key precondition to this. This in turn implied lesser government interference and smoother procedural follow ups. In fact, donor agencies and international financial institutions have conditioned their support to countries upon the latter's ability to adopt the spirit of development governance and adhere to proper administrative processes in dealing with development aid and put in place effective policy instrument to ensure the same. Thus, apart from the within discipline quest for better forms of public administration, it is globalization and international agencies as well, which have been responsible, almost in equal proportion – for mainstreaming of development governance.

Various countries have proceeded with the governance agenda with varying levels depending upon their internal structure. Though development governance has been much in vogue, bureaucracy has not lost its influence either although the scope for interaction and partnership has been widened.

## Elements of Development Governance

An investigation into the evolutionary linkages of development governance itself throws light upon its key elements. Development governance is contextualized response to the need for responsive institutions that in partnership with various stakeholders could manage development without corruption, procedural hassle, discrimination, nepotism, and rigidity. Subsequently, international development discourse has added the need for governance that promotes ecological balance, environment protection, and sustainability.

Ostensibly, development governance has to be: participatory, consensus-oriented, accountable, transparent, responsive, effective and efficient, equitable and inclusive, and follow the rule of law; It assures that corruption is minimized, the views of minorities are taken into account, and that the voices of the most vulnerable in society are heard in decision-making; It is also responsive to the present and future needs of society. Expanding upon the UNDP's (1997) eight elements or characteristics of good governance, elements of development governance are as under:

### Participation

Governance for development has to be based on equal rights of all citizens irrespective of class, creed, caste, gender, or any other form of identities. These equal rights have to be materialized either through direct democratic rights or through legitimate institutions or representatives. Such a process is based on freedom of speech and association for all.

### Rule of Law

Rule of law implies that law works similarly and impartially for all individuals irrespective of their background identities. Good governance requires that appropriate legal systems should be created to protect human and constitutional rights. The rule of law should be designed to provide stability and predictability, which are the essential elements in creating an economic environment in which business risks may be rationally assessed.

### Transparency

Transparency is critical element of governance and is important to ensure accountability and responsiveness on the part of government functionaries. This implies sharing of institutional processes, outputs, and almost all information in public domain, i.e., making them accessible to the citizens including those who are likely to be affected. This is required to ensure continuous monitoring of whether policy decisions are made and implemented in accordance with existing rules and regulations. Transparency also implies the media's access to information so that it could be disseminated to the people particularly to those who are likely to be affected and can communicate their feedback back to the policy system. Access to information for various players in the market is also essential for a competitive market economy.

### Responsiveness and Accountability

Good development governance requires that institutions and processes respond to all stakeholders and the citizens irrespective of their backgrounds. Further, it is also that the response is given within a reasonable time frame, otherwise it is likely to lose its relevance. The onus to respond and stay transparent invokes accountability in governance, which is another important element. Development governance holds that public functionaries are to be held accountable to the people for their action and its consequences.

Further, not only governmental institutions but also the private sector and civil society organizations must be accountable to the public and to their institutional stakeholders.

### Consensus Oriented

Since governance for development is based on partnership, the need for consensus in setting policy priorities and designing implementation and monitoring mechanism is indispensable. This also involves minimizing conflict of interest and striving for common good of the community concerned as a whole. It also requires a broad and long-term perspective on what is needed for sustainable human development and how to achieve the goals of such development.

### Equity and Inclusiveness

When speaking of development today, one means development that is based on equity and includes all. Governance for such a development has to run on the principles of equity and inclusiveness. This implies that each citizen gets equal opportunity to improve or maintain their well-being. As such, each member of society is likely to have a sense of ownership in the process of development governance. Special consideration is often required for the most vulnerable groups to enable them to participate in development opportunities provided through participatory governance.

### Effectiveness and Efficiency

Traditional bureaucracy has been criticized for its unproductiveness and inefficiency. On the contrary, effectiveness and efficiency are foremost elements of good governance. This requires that institutional processes minimize wastage of resources and produce results that meet needs through optimum use of resources. This also indicates that results have to be achieved within stipulated time frame. In the process norms of sustainable use of environmental and natural resources should also be adhered to.

### Sustainability

Development governance and sustainability have often been considered as two sides of the same coin. Sustainable development is a broad framework that includes environmental as well as social and economic sustainability. Thus, sustainable development is a multidimensional notion and multisectoral practice and is considered to be attainable only through development governance which can facilitate partnership and ownership from all stakeholders.

As governance and development has invited much attention from international development agencies, the World Bank and the Asian Development Bank have also proposed certain elements of good governance. According to the World Bank, the elements of good [development] governance are: public-sector management, accountability, actions, legal framework for development, and transparency and information (IFAD 1999). The Asian Development Bank identifies four elements, i.e., accountability, participation, predictability, and transparency. It is clear that these elements overlap with the above list of eight elements which is comprehensive and takes care of sustainable development challenges as well.

## Institutions and Actors of Development Governance

Development governance involves two processes – decision-making on development and its goals, targets, and pathways and implementation of those decisions. In context of development governance, decision-making is a process in which state institutions and non-state actors – the stakeholders of development – act as group to arrive at decision on the basis of consensus. Further, the implementation of these decisions is a process that starts from state institutions but involves ownership, monitoring, and management by interested and affected stakeholders. The participants in the process of decision-making as well as in the process of implementation of decisions constitute various actors of development governance. Institutions and structures are concerned platforms that coordinate the process and provide a platform for consensus building and convergent action. At the same time, the institutions are also the actors in the entire process. Thus, an actor may be individual or group or institution that participates in the process of decision-making and implementation. A structure is an organization or a mechanism that formally or informally may steer the decision-making process and sets into motion the different actors and apparatuses in the implementation process.

As per the Britannica Online Encyclopedia, the structure of new governance highlights the role of networks, markets, and non-state actors wherein the boundaries in between have blurred. Since the concept of governance is associated with influence of neoliberal ideas, its structure has international dimensions including actors from outside the countries. Thus the boundaries between the national and the international also become diluted in certain cases. Thus, the institutional structure of development governance is less rigid and more flexible to involve local as well as international actors – private or public – with nation states for the cause of development.

### The State

Despite all the porous nodes government structure allows today, the state remains the key and perhaps overpowering actor as far as development governance is concerned. Depending upon the context, the institutional structure of the state varies. Mostly, in electoral democracies, the state is comprised of an elected government, and representative institutions are expected to execute people's will.

Certain traditional roles of the state which deal with matters of citizenship remain intact. This include maintaining the social, economic, and legal order within the country through its administrative apparatus, retaining the mandate to control and exercise force for protection of constitutional rights of citizens, having ultimate responsibility for public services and creating an enabling environment for sustainable human development. In context of development governance, the latter two roles have undergone marked transition. The government herein is increasingly expected to confine itself to the first two roles which should be performed in a stable and transparent manner so as to facilitate space for the market and other stakeholders for the service delivery and human development. In this regard, the emergence of international development commitments such as the Sustainable Development Goals (SDGs) has further accentuated the expectations from the state. Here the challenge that lies with the state is how to address the concerns of equity and address the lack of opportunities with the poor to expand their capabilities. The traditional roles of the government are now assessed in the light of their efficacy to provide stable, transparent, and responsive environment for achieving development goals through partnership with non-state actors.

### The Private Sector

In context of development governance, many governments consider the private sector (as different from civil society) as an important development partner. This role for private sector is grounded in the neoliberal agenda wherein the governments have committed themselves to disinvestment of public enterprises, reduce expenditure and deficits, and promote private investment. In their attempts to meet these commitments, governments find justification in inviting private sector for development goals. The most important argument for private sector involvement has been that of employment generation, which is expected to get impetus through spur in private investment.

Thus, governments are now also evaluated by mechanisms such as the World Bank's tool of measuring the ease of doing business. This evaluation is based on indicators of stable macroeconomic environment, transparency, responsiveness, procedural efficiency, and so on. Knowledge and technological transfers and human resource development are other sectors where governments are promoting private investment for expansion of jobs and opportunities. Private sector investment is expected to bring spur in economic growth rates, and it is expected that this has spillover effect in terms of work and employment.

Another way the governments are now partnering with private sector is the practice of "corporate governance." Corporate governance has become a mechanism for direct and micro level development intervention by private sector particularly big corporate houses. Several multinational corporations today provide technical and financial support to government and non government organizations for community level development programs. Often such corporates create foundations or trusts to undertake such activities. The Bill and Melinda Gates Foundation is an international example for private sector intervention in development governance. Similarly, there are many corporate houses that have created separate subentities for corporate governance activities indirectly or directly. Within the framework of development governance, these interventions have been encouraged by the government and are important actors in the governance process.

### Civil Society (National and International) and Media

All remaining actors other than the government and the private sector constitute the civil society. However, the domain of private sector that deals with corporate governance activities also overlaps with civil society. The civil society includes nongovernmental organizations, and other community-based and sector-specific organizations, such as citizens' groups, association of workers/farmers, charitable institutions, cooperatives, religious communities, political parties, and research institutes. These organizations are private in nature but have public functions or objectives. The role of civil society is critical in the framework of development governance situated within neoliberal democracy.

As the governments are retreating from many areas and often on the pretext of good governance, civil society organizations act as the link to create the system of check and balance on behalf of the citizens. Civil society offers platform for people to participate in governance and affairs that have implications for their lives. In the process, the civil society enables people to express their voice and negotiate with the government institutions by organizing them as interest and pressure groups. This role is particularly critical when the stakeholders are the poor and the marginal usually unable to approach the government. Here, civil society organizations often conducts capacity building programs for the marginalized and the voiceless to enable them to participate in mainstream process of seeking rights and justice. These activities of civil society constitute the "advocacy" aspect.

The civil society is also engaged more directly in supporting government's development activities and acting as a link between the government and the people. As development governance seeks stakeholders' involvement for better and effective implementation of development-related decisions and goals, their reliance on civil society has been increasing. This necessarily involves partnering with civil society since they have greater community outreach and can ensure community monitoring of various development programs. In case of conflict of interests also, civil society's involvement is sought for consensus building at community level. Moreover, nurturing an environment for sustainable human development requires civil society organizations that make political and social interaction easier and that mobilize society to participate in economic, social, and political activities (UNDP 1997) (Fig. 1).

Amidst neoliberal public policies, government and civil society have evolved into some kind of symbiotic relationship though the latter's role goes much beyond that. Although the civil society usually draws its strength from the constitution, the emphasis on governance has created a favorable environment for it to grow. In this regard it is important that governments ensure the operationalization of appropriate legal framework for functioning of civil society and in fact they have done so.

Media is considered as the third pillar of democracy and has a very significant role to perform in context of development governance. Although it is a part of private sector, in establishing accountability on the part of various actors, it is the media which is expected to play a key role by ensuring the dissemination of right information across the board. Civil society in fact relies on media to prepare its case in dealing with government players.

## Key Issues and Concerns on Development Governance

### Political Orientation

To begin with, development governance is an agenda often pushed from outside the government. In many developing countries the need for a focus on governance has been co-terminus with the imposition of structural adjustment programs based on the need for minimal government. Thus the demand for governance did not necessarily come from within. In such a context, governance reform has been a half-hearted and fragmented exercise. Thus, despite more than two decades of bringing good governance on its agenda, governments in many countries such as India are far from implementing actual reforms. Apparently, the idea of minimal state underlying governance for development amidst neoliberalism has been maneuvered by the state to escape its obligations to its citizen. Often governments are seen to withdraw from critical socioeconomic activities in the name of minimal government without creating alternative platform. This has created some sort of vacuum in certain sectors, for example, healthcare in India.

Further, in the name of involving civil society, the focus of government has been either in seeking financial aid or in shifting its responsibilities to civil society institutions. In case of financial aid, there has been involvement of international civil society but this has failed to produce desired results. The reason is that the governments have not shown enough commitment to facilitate

proper utilization of aid resources. There is a lack of political will in this regard beyond procuring the aid. Also, in its attempt to attract international aid and donor funds, governments have been preoccupied with their expectations without investing adequate reasoning in it. Pressing domestic issues are often sidelined by government in prioritizing the agenda of donor agency since the latter is bringing funds with it.

Further now for its important activities including policy making, governments have shown increasing reliance on civil society. The concern here is can civil society be a substitute for the functions of a representative government.

### The Bureaucracy

Max Weber in his theory articulates exquisitely that bureaucracy once it comes into existence is likely to be permanent – it is self feeding and self generating. This observation of Weber is reflected well today in the relentless dominance of bureaucratic forces despite the advent of development governance agenda. The bureaucracy today does not necessarily display a significant sign of efficiency or transparency in its functioning. The bureaucratic dominance continues to shape up the future of development through their persistent procedural inefficiencies. Even if there is involvement of the civil society including the community, the government departments have to facilitate the process aspect. Bureaucracy is rarely swift in acting as a facilitator unless it is under extreme pressure due to some contingency. Thus, by and large, development governance remains compromised before constant manipulations to meet the interests and priorities that emerge from the nexus between the political and the bureaucratic authority. In fact, at times the bureaucracy through resource rich civil society institutions – may also be seen to feed its own interests through clandestine negotiation processes. Corruption is a familiar word to express some of the continued bureaucratic practices amidst much hue and cry over good governance.

As long as there is corruption, the governance agenda is a failure since it is based not just on minimal government but also on transparent and efficient government. The government and its bureaucracy machinery have to work hard to instill people's confidence in its system. But the issue is whether there is a will to change – both at political and bureaucratic level, beyond just shifting their duties to the civil society. While civil society involvement in such circumstances is just a façade, political and bureaucratic obsession with power and corruption continue to divert resources away from the cause of development and poverty eradication. Despite enactment of various anti-graft legislations, it remains the biggest challenge across the world to free government machinery from corruption.

### Fiscal Management

Despite all its emphasis on minimal government, development governance does call for an important role for state in certain sectors such as in poverty eradication, education, health and of course the reform of its administrative machinery. It is in this context that the government of India for instance legislated the National Rural Employment Guarantee Act and Food Securities Act. Similar programs have been implemented in other countries such as in Mexico where *Prospera* (earlier *Progresa*) has been in existence since 1997 as social assistance and poverty eradication program. However, meeting the resource requirements of such huge countrywide programs has been a challenge. This is particularly critical since in context of today's open economy government must maintain certain level of fiscal prudence and avoid high fiscal deficits so as to remain relatively insulted from changing economic scenario across the globe. Development governance thus when seen in the light of economic liberalization also reflects certain level of contradiction in it. The challenge, however, may not be as insurmountable if the leakages in the development programs caused due to systemic corruption are blocked. A focus on raising revenue base through restructuring the system of taxation is also required. Expanding direct tax bracket may have considerable implication for public revenue base and fiscal strength. This is so particularly in context of growing income

**Development Governance, Fig. 1** Actors of development governance: Negotiating, finalizing and executing the development agenda

inequalities wherein the rich is paying relatively less as tax when compared with those belonging to relatively inferior economic strata.

## Conclusion

Evidently, aforementioned issues connect directly or indirectly to the aspects of political orientation and bureaucratic functioning which thus are the central concerns before development governance today. There are several contradictions between what development needs and how governance is understood and practiced. In fact, a stream of thinking goes to the extent of arguing that for all the confusion it has created, the agenda of governance has been defeating for the agenda of development. Further, in contexts of several conflict ridden states of Africa, lack of capacity for governance reform is also a concern. For these countries, emergence from extreme economic backwardness itself could be a source for political reforms since conflict often roots in extreme deprivation. Political condition is an important determinant of development and is also shaped by the state of development. The recognition of these linkages has also been instrumental to develop the popular belief in the virtues of governance. Indeed, most of the issues or concerns that development governance faces today happens to pertain to the politics of it.

# Development Impact Fee Program

Gregory S. Burge
University of Oklahoma, Norman, OK, USA

## Synonyms

Capacity fee; Capital expansion fee; Capital recovery fee; System development charge

## Definition

Development impact fees are one-time levies imposed by a local government during the permit approval process. They are levied according to a schedule of fees that has been adopted by the community. Revenues are earmarked for capital expenditures that are associated with the construction, expansion, or renovation of public infrastructure servicing the developing area in question. Traditionally, programs have been held subject to a "rational nexus" test establishing their legality.

## Introduction

Local governments have long been aware of the need to creatively raise revenues to cover the costs associated with expanding public infrastructure systems to accommodate growth. And while they are often still framed as a novel and innovative financing method, development impact fee programs are now firmly entrenched with the landscape of local governance. Thousands of development impact fee programs now operate in the United States, a surprising reality given that they did not exist 50 years ago. In fact, 29 US states – including nearly all western and southern states – have now adopted impact fee enabling statutes, while programs can be found in many other states due to the "home-rule" status of municipalities. A telling fact is that of the roughly 1,300 communities with populations above 25,000 persons, nearly 60% now use impact fees to finance infrastructure (National Association of Homebuilders 2016).

In simple terms, impact fee programs represent an attempt on the part of a local government to narrow what is often framed as a pre-existing disconnect between the development approval process and the generation of revenue that will (at least partially) be used to pay for the infrastructure costs associated with that growth. As such, they play a critical role in what can be framed as a two-part pricing scheme, where impact fees theoretically cover the fixed costs of service and property tax revenues then cover the marginal costs.

This encyclopedia entry outlines the history of development impact fee programs in the United States. It then shifts into a discussion of their causes, consequences, and likely future challenges.

From the start, it is important to acknowledge the unavoidable controversy associated with impact fees. While they have gained support from both scholars and practitioners or local public finance, they are stridently opposed by the National Association of Homebuilders, the National Association of Realtors, and many "pro-Growth" and "pro-business" local interest groups. The most frequently cited criticism of development impact fee programs among scholars is that they may have adverse effects on the availability and affordability of housing – particularly among starter homes and rental housing – thus harming already vulnerable working class and poor households. The most frequently cited criticism of these programs among government officials and developers is that they may stifle economic development and robust job growth within adopting communities. While the present exposition does not seek to advance these negative views of impact fee programs, it does take those two concerns very seriously.

## How Did We Get Here? Antecedents to Impact Fees and Their Rise to Popularity

The antecedents to development impact fee programs were in-kind exactions. These often took the form of land and/or facility dedications that were negotiated in an ad hoc manner between local governments and developers (Altshuler and Gomez-Ibanez 1993). Most early legal battles that display a connection to the topic of impact fees were actually cases centering on "in-kind" donation requirements or requirements to pay fees covering on-site development and/or connection costs. The explosion of modern monetary-based impact fee programs, where fee revenues can be spent off-site for system level improvements, dates back to a groundbreaking 1976 case where developers sued the city of Dunedin, Florida. The judge ruled in favor of the city, establishing a legal basis for allowing impact fee charges that were "reasonable, proportional, and earmarked," thus forming the three pillars of what has become known as the "rational nexus test." Shortly thereafter, in 1977, Broward County adopted what can be viewed as the first countywide development impact fee program, using language that closely followed the newly established legal protection offered from the Dunedin case. They charged $125 per newly permitted home for park services (Burge and Ihlanfeldt 2007). Moreover, just a few months later, on June 6, 1978, California voters passed the now somewhat infamous "Proposition 13" initiative that severely limited local governments' ability to raise additional revenues through property tax hikes. (Through serendipity or pure coincidence, my first breath was drawn just 3 days after the passage of Proposition 13. I grew up in a suburban Midwestern community that experienced a quadrupling of its population between 1960 and 1990. Both bear an uncanny connection to the topic of impact fees.) Scholars of Public Administration have characterized Prop 13 and the many similar pieces of legislation as part of a "property tax revolt."

Summarizing a complicated political movement in a way that is admittedly blunt, I would argue that this combination – that of newly legal development impact fees and severely hamstrung property tax programs – fueled a perfect storm and led to the explosion of impact fee programs across the portions of the United States that were rapidly adding population. In fact, a majority of the most impactful development impact fee programs currently seen in the United States date to initial adoptions during the 1980s. For example, in the State of Florida, only two counties (Broward and Palm Beach) had the program in place prior to 1980, but well over half of Florida's 67 counties, and essentially all of Florida's urban counties, had programs by the end of that decade (Burge and Ihlanfeldt 2007). Other rapidly developing states shared similar experiences. One characterization of the movement toward development impact fees is that communities quickly embraced the idea that impact fee programs were a practical and legal means of addressing budgetary shortfalls associated with adding capacity to existing public

infrastructure systems that badly needed help as they were accommodating rapid population growth (Altshuler and Gomez-Ibanez 1993). A strong piece of evidence that speaks to the effectiveness of development impact fee programs is that communities hardly ever remove programs once they are initially adopted.

## The Effects of Impact Fees on Housing and Land Markets

While development impact fee programs date to the late 1970s, their rapid growth in the early to mid-1980s is likely the factor that motivated academic interest in studying their effects on housing markets. Contributions by Snyder et al. (1986), Downing and McCaleb (1987), Huffman et al. (1988), Delaney and Smith (1989a), and Singell and Lillydahl (1990) all helped lay the groundwork for what became known in the literature as the "traditional" view of impact fee programs as it was formalized by Altshuler and Gomez-Ibanez (1993). Under this approach, development impact fees are framed as an excise tax levied on the production of new homes and commercial properties. Like other taxes, the fees are argued to shift the supply curve to the left, by the dollar amount of the impact fee, and the relevant elasticities of the supply and demand for new homes interact to determine the overall tax incidence. Similarly, to the extent that new and existing homes serve as close substitutes for one another in most housing markets, an equivalent sized positive spillover effect onto the price of existing homes occurs as well.

In the long-run, developers of new properties are assumed to be mobile across jurisdictions and thus are able to fully avoid the burden of impact fees. The incidence is then either shifted forward to the consumers of housing in the form of higher housing prices or shifted backward onto the owners of undeveloped land. The fraction of the burden going each direction is determined by the existing elasticity conditions of the market in question. One must then acknowledge that there is no "one size fits all" answer to this question, as elasticities vary considerably across different environments. For example, the supply of new construction is not nearly as elastic in San Francisco or Seattle as it is in Houston or Oklahoma City.

More recently, contributions by Brueckner (1997), Yinger (1998), Nelson and Moody (2003), Ihlanfeldt and Shaughnessy (2004), and Burge and Ihlanfeldt (2006b) have extended the conclusions of the "traditional" view into what is now often referred to as the "new view" of development impact fees. Brueckner (1997) advances a theoretical model that compares the efficiency properties of various infrastructure financing schemes, including development impact fees. Beyond demonstrating the steady-state efficiency properties of impact fees, he shows that the direction of the effect of impact fees on construction rates is ambiguous. Yinger (1998) most directly challenges the assertions of the traditional view and is thus credited for being the main architect of the new view. In Yinger's *National Tax Journal* model, revenues from impact fee programs are used to directly provide valuable local public infrastructure. Thus, beyond the direct effect the fee has on the supply side, there are two indirect effects on the demand for housing in the adopting community. First, demand is stimulated by the enhancements to the quality and/or quantity of public services in the community. Second, impact fee revenues lessen the pressure to raise property tax revenues, such that adoption of a fee program is associated with lower current and future property tax burdens.

Extensions of the supply side implications of the Yinger model come from both Nelson and Moody (2003) and Burge and Ihlanfeldt (2006b). In the Yinger model, the impact of development impact fees of the supply of new construction is framed as unambiguously negative. However, this is not completely accurate. Nelson and Moody argue that the adoption of impact fee programs should increase the supply of land zoned and/or allowed for residential development, suggesting local planning commissions control these decisions and will therefore be more accepting of new development following the imposition of impact fee programs. Following similar logic, Burge and Ihlanfeldt (2006b) add

that communities with stringent exclusionary land use regulations in place may reduce and/or eliminate some of these barriers (or at least slow the rate of growth in their evolution over time), such that the indirect costs associated with overcoming regulatory barriers in the community are lessened. This is important since it demonstrates consistency with the literature on land use regulations (e.g., Gyourko et al. 2008; Glaeser and Ward 2009) as well as the more rigorous recent empirical investigations of the effects of impact fee programs. Put simply, the supply side effects of development impact fee programs are complicated. On the one hand, they add a monetary cost to the development process. On the other, developers may benefit from the greater supply of developable land and reduction in other regulatory development barriers.

Turning to the empirical evidence on the effects of impact fees, most of the early literature focused on the way impact fee programs influenced home prices. These include Delaney and Smith (1989a, b), Singell and Lillydahl (1990), Nelson et al. (1992), and Skaburskis and Qadeer (1992). These studies produced a set of largely inconsistent findings. The likely culprit, at least in part, was that the studies did not have access to appropriate longitudinal data capable of overcoming a strongly suspected endogenous relationship between the variables of interest (i.e., the idea that development impact fees are more likely to be adopted in communities where housing prices are already on the rise due to population growth). For example, Singell and Lillydahl find that a newly adopted $1,182 impact fee increases the price of new homes by just under $4,000 but that the same impact fee caused the price of existing homes to rise by over $7,000, a highly implausible result. Of these early investigations, the piece by Skaburskis and Qadeer produces the set of findings that is most consistent with more recent studies that have used more methodologically appropriate panel data estimation techniques. They find the positive price effect to be roughly 1.2 times the size of the impact fee itself.

Burge and Ihlanfeldt (2006b) use 11 years of panel data from Florida to investigate the price effects of County level impact fee programs across distinct size/quality segments of the market for new homes. Adding a number of relevant control variables and, most importantly, using panel data fixed effects techniques, this study overcomes the endogeneity issue and estimates that a $1 increase in impact fees will increase the price of small-, medium-, and large-sized homes by $0.39, $0.82, and $1.27, respectively. This marked the first piece of evidence for the now robustly supported idea that development impact fees cause a rightward shift in demand that is roughly proportional to the value of the home, for both new and existing homes.

The capitalization effects of impact fees into land prices have also been a consistent area of interest in the literature. Burge (2014) investigates the potentially nuanced effects that various categories of development impact fees have on the price of both residentially zoned and commercially zoned undeveloped land parcels. School impact fees, which are paid only by residential developers, are shown to be negatively capitalized into the value of residentially zoned parcels but increase the value of undeveloped commercially zoned land. Other meaningful asymmetries surface when considering utility fees (i.e., water and sewer system fees). In this case, a strong negative effect is found for residentially zoned land, but no effect is found for commercially zoned land – providing at least some anecdotal evidence that commercial development may value utility services more intensively than residential customers. Regarding traditional categories of impact fees including transportation, fire, police, and park fees, a negative effect on value is found for both categories, but the effect is much smaller in magnitude for the residentially zoned parcels – an intuitive result when considering that residential demand is likely to be willing to pay more to live in communities with high-quality public services than would be the case for commercial development.

Beyond the effects of home prices, which the literature has always shown to be positive, the effects of development impact fees on construction rates merit attention due to the theoretical ambiguity established by Brueckner (1997). In fact, one of the biggest concerns associated with implementation of development impact fee programs is that some worry they will stifle the

production of affordable new homes most dramatically, potentially exacerbating housing affordability issues (Anthony 2003). However, the empirical evidence does not support this claim. To address the question of whether or not impact fees help or harm the provision of affordable housing opportunities, Burge and Ihlanfeldt (2006a, b) investigate the effects of impact fee programs on construction rates for both single family and multifamily housing. In doing so, they estimated separate models for Florida's central cities, inner and outer suburban areas, and rural areas. They find that impact fees used to fund infrastructure otherwise financed through property tax revenues (e.g., roads, parks, schools, fire, and public safety) have a positive effect on residential construction rates in suburban areas but have no significant impact on construction rates in central-city and rural communities. This result holds for both single family and multifamily housing. For affordable housing, including apartments, the positive affect seems to be limited to the inner suburbs, whereas it applies to both inner and outer suburban communities when considering larger homes. These results seem consistent with the idea that exclusionary barriers to affordable housing may be sufficiently strong in outer suburban areas – where populations are more homogenous with respect to both race and income – such that any small reductions in their stringency associated with the imposition of impact fee programs may simply not be enough to stimulate the production of affordable small homes and apartments in exclusive outer ring suburban areas.

## The Next Generation of Impact Fee Programs

From the early adoptions seen in the late 1970s to the programs administered today, the specific elements embodied within development impact fee programs have evolved relatively quickly. For example, many programs now charge higher fees for larger homes and/or homes that have more bedrooms, as compared to most early programs which levied uniform rates. Another example of this evolution is that a significant number of programs now contain different impact fee zones, where charges are higher (lower) in areas that have particularly underdeveloped (already developed) existing infrastructure. Another element of the evolution of impact fee programs comes from expansions in what types of services are covered. Early programs were mostly contained within four core areas: utilities, transportation, parks, and public safety. Now it is common to see programs for education finance, public transportation, and even environmental mitigation fees devoted to advancing sustainable development patterns (Burge and Ihlanfeldt 2013). There is good reason to believe this trend will continue as the fields of planning, economics, political science, public administration, sociology, legal studies, and geography continue to advance our understanding of the deeply interconnected economic relationship between newer and older properties situated within the same community, as well as the relationship between the various communities situated within the same regional/metropolitan area.

## Conclusions

This entry seeks to provide a brief overview of the historical expansion of development impact fee programs in the United States. It also illustrates their current position within the overall landscape of local public finance, including summaries of how impact fee programs influence various outcomes within local housing markets. In doing so, both efficiency-related and equity-related concerns were given attention. My hope is that a broad introduction to the topic has been advanced, such that readers will walk away having learned a handful of key pieces of information but are also left with a hunger to learn even more about this provocative and innovative tool of local public finance. At the end of the day, those within the fields of public administration and economics should be deeply concerned with how to best "get the pricing right" when it comes to paying for local public services – a topic introduced over 50 years ago by Charlie Tiebout – and one that stands to this day as the source of much controversy (Tiebout 1956).

Development impact fee programs can and should play an even more enhanced role in matters of local public finance than they do currently. Essentially every sizable growing community should have at least a basic impact fee program in place to address the issues associated with accommodating growth. *The costs of building/expanding public infrastructure and/or services should be covered through impact fee revenues. The costs of operating and maintaining public infrastructure and/or services should be covered through property taxes or other local taxes.* Viewed through the lens of an efficient two-part pricing mechanism, development impact fee programs can serve as valuable Coasian bargaining mechanisms that mitigate the frictions characterizing the contentious relationship between local governments and the development community. Although the two sides may always have somewhat divergent goals – those divergent goals can be pulled a few steps closer to one another through well-designed impact fees.

# Development of E-Government and Its Challenges, Iran

Hassan Danaeefard[1], Akbar Hassanpoor[2] and Tayebeh Abbasi[3]

[1]Faculty of Management, Tarbiyat Modares University, Tehran, Iran

[2]Faculty of Management, Kharazmi University, Tehran, Iran

[3]Faculty of Management, Tehran University, Tehran, Iran

## Synonyms

E-government; Information and communication technology

## Definition

E-government refers to the utilizing of information and communication technologies to develop and improve the relationship between government, citizens, businesses, and other society entities.

## Introduction

E-government has been an important outcome of rapid developments in information and communication technology (ICT), whose implementation has dramatically changed the conduct of social life and the management of countries. This social phenomenon is a combination of information technology and web information network, which aims to directly serve citizens, businesses, and government sectors.

Using e-government, countries can satisfy citizens and reduce costs as well as enhance their power to monitor society. Regardless of the type of government managing a society, e-government helps governors in leading that community toward their goals.

On the other hand, the implementation and development of e-government has often been focused on making changes in the processes of public organizations, such as decentralization, improving efficiency and effectiveness. However, there is no single definition for e-government, and this is due to the dynamic and changing nature of technology. The information and communication technology is applied to improve efficiency and effectiveness, information transparency and comparability of information, and monetary transactions in the government; between government-to-government-affiliated organizations at the national, municipal, and local levels (G2G); and information and monetary transactions to citizens (G2C) and to business (G2B) and to realize e-government. E-government enables double-sided access to information via ICT and leads to greater empowerment of people in using information. In fact, the existence of such networks based on ICT changes the relationship between the people and the government.

Accordingly, all governments are increasingly using ICT in the form of e-government to perform their daily tasks and operations, thereby resulting in an increased research focus on e-government, and researchers have developed diverse conceptual and theoretical models to understand the various aspects of e-government.

For the past two decades, Iran has been taking steps to implement e-government. But it has not been able to achieve its goals as yet. The following section will define e-government and also investigate the status of e-government in Iran as well as explain the challenges faced in application and implementation.

## Defining E-Government

There are different definitions of e-government. Some define it as the means of digital governmental information or a way of engaging in digital transactions with customers. For others, e-government consists of creating websites that present information about political and governmental issues. This is a multidimensional and complex concept, which requires a careful definition and understanding, in order to design and implement a successful program. The key element of all these definitions is the use of ICT tools to change and reinvent the public sector by transforming its internal and external ways of doing things and its interrelationships with *customers* and the business sector. The analysis of these definitions allows us to characterize the main elements of an e-government framework as per Ndou (2004):

- Transformation areas (internal, external)
- Actors, users, customers, and their interrelationships (citizens, businesses, government organizations, employees)
- E-government application domains (e-services, e-democracy, e-administration)

## E-Government Maturity and Its Models

Due to the interactions between the elements of e-government (public organizations, businesses, government employees, and citizens), e-government benefits not only the government

but also the citizens, private sector, and government employees as well. E-government is a socio-economic system and a link between government, citizens, and businesses. The strategic goal of e-government is for the government to support all the sectors interacting with it, such as governments and other public sectors, organizations, and citizens. Therefore, the aim of e-government is the realization of good governance. Good governance can be considered in terms of the ability of economic, political, and administrative authorities to better manage the country at all national and local levels. The strategic objectives of e-government can be assessed both internally (people's satisfaction and their expectations along with facilitating interactions between people by providing timely services) and externally (speed, transparency, efficiency, and effectiveness in government administrative activities).

It is important to note that according to the needs of different governments, the e-government goals are determined in different forms, and basically governments determine their goals on the basis of stages of growth and maturity of e-government, so until now they have set up and followed higher goals so as to take advantage of this phenomenon.

In the literature, there are various models. This section will now address some of the important maturity models.

## UN/ASPA Study: Five Stages of E-Government Model

This model identifies five stages to quantify the progress of e-government. It identifies the e-government stages as representative of the government's level of development based primarily on the content and deliverable services available through official websites. These stages are:

Stage 1: Emerging: An official government online presence is established through a few independent official sites. Information is limited, basic, and static.

Stage 2: Enhanced: Government sites increase; information becomes more dynamic. Content and information are updated with greater regularity.

Stage 3: Interactive: Users can download forms, e-mail officials, interact through the web, and make appointments and requests.

Stage 4: Transactional: Users can actually pay for services or conduct financial transactions online.

Stage 5: Seamless: Total integration of e-functions and e-services across administrative and departmental boundaries.

## Layne and Lee's Four-Stage E-Government Model

Layne and Lee (2001) provided a four-stage model of e-government development to help public administrators think about e-government and their organizations (Fig. 1). This model includes the following stages:

Stage 1: Cataloguing: During this stage, the initial efforts of governments are focused on establishing an online presence for themselves.

Stage 2: Transaction: In the transaction stage, e-government initiatives focus on connecting the internal government system to online interfaces and also allow citizens to carry out electronic transactions with the government.

Stage 3: Vertical integration: This refers to connecting the local, state, and federal governments for different governmental functions and services.

Stage 4: Horizontal integration: This is defined as the integration across different functions and services. In defining the stages of e-government development, the vertical integration across different levels of the same functionality is posited to precede the horizontal integration across different functions.

## The World Bank Stage Model

This model divides the process of e-government implementation into three phases. These phases

**Development of E-Government and Its Challenges, Iran, Fig. 1** The Layne and Lee E-government Model (2001)

are neither dependent on each other nor is there the need for one phase to be completed before another can begin; but conceptually, they offer three ways to think about the goals of e-government (Fig. 2).

Phase 1: "Publish": This refers to publishing sites that seek to disseminate information about the government and information compiled by it to the widest audience possible. In doing so, the published sites serve as the leading edge of e-government. During this phase, a variety of information is published on the web, including rules, regulations, documents, and forms.

Phase 2: "Interact": During this phase, the users can provide feedback and submit common legislative or policy proposals. Interactive e-government involves two-way communications, starting with basic functions like the e-mails and contact information of government officials and feedback forms that allow users to submit comments on programs or policy proposals.

Phase 3: "Transact": During this phase, the users can go for completely secure online transactions, allowing citizens to obtain government services or the business sector to transact with the government online. A transact website offers a direct link to government services, available at any time. Transact sites can enhance productivity of both public and private sectors by making the processes that require government assistance or approval faster and cheaper.

## History of E-Government in Iran

In recent decades, many countries have attempted to implement ICT in administration and service

**Development of E-Government and Its Challenges, Iran, Fig. 2** The World Bank Stage Model of E-Government (2003)

provisions through these tools and the realization of e-government generally. Studies and surveys in this context indicate an extensive attempt by and competition among different countries in this field.

Along with other countries, Iran too has been making sporadic and wide efforts in implementing ICT since the past two decades. The first scheduled orientation in this field was projected in the framework of the Third Plan for the economic, social, political, and cultural development of the country. In this regard, the Iran University of Science and Technology and Kish regional organizations held a conference titled "Conference of Electronics and Internet Cities Worldwide" in May 2001, and this marked a new chapter in informing about the development of ICT and its dimensions in the country (such as e-commerce, e-banking, e-learning, credit cards, the Internet, and its various applications).

However, the first organized and comprehensive measure in this field was taken in the initial months of 2002, when the plan to modify processes and work methods as well as develop office technologies was approved as one of the seven plans for creating a change in the country's administrative system.

In this regard, a proposed regulation "IT Application Development" with the acronym "TEKFA" was approved by the Cabinet. The plan to coordinate the implementation of ICT in the country was approved on 30 June 2002 and communicated to the relevant organizations for execution. In order to clarify the plan's framework, the country's Supreme Council of the administrative system approved the plan to develop information technology in the country's administration (administrative automation plan) on 6 July 2002. The realization of e-government in the country came as a bill which was proposed by the country's management and planning organization. The mentioned plan, which included the obligatory automation of general and specific activities of government agencies, was communicated to be executed by all the government agencies.

The continuation of this plan was endorsed in 2004 with the passing of the Law of the Fourth Economic, Social, and Cultural Plan of Islamic Republic of Iran. The things that the law considered explicitly in this regard included obligating the government to establish a system of electronic banking; extending the application of ICT in economics, commerce, and trade; updating databases and information centers; providing services by public organizations through computerized and networked systems; and so on. Also in 2007, the document of comprehensive IT system was approved. This document identified the strategic areas of ICT, fundamental objectives, strategic directions, as well as strategies for achieving the future goals of the Islamic Republic of Iran in this regard.

Now, the Law of the Sixth National Development Plan determines the future of Iran's approaches and measurements in the field of e-government and e-services. This plan is in the form of articles, and it clearly deals with the issues of the development of electronic services and e-government; and e-health, e-banking, e-services, communication infrastructure, and government databases are among the important items included in this law.

## Analysis of the Status of the Iran's Performance in Realizing E-Government

The main objective of the development of IT applications and the realization of e-government in Iran is to provide effective and efficient services and to respond favorably to the citizens using ICT (the analysis and evaluation of the status of Iran's performance in the field of e-government is based on the findings of three studies by the Parliament Research Centre, by the Strategic Research Centre of the Expediency Council, and by the Communication Research 13 of the budget of 2007 of websites of governmental organizations and the way of providing e-services, the office of new technologies of research center of Parliament, accession number 9456 2008. The report of prioritizing public e-services in the country, the office of new technologies of research center of Parliament, accession number 9555 2013; The evaluation of e-government, office of studies of new communications and technologies of research center of Parliament, accession number 10283 2010). In order to achieve this goal, Iran has framed and approved several laws and regulations related to e-government and provided public services. The most notable among these are TEKFA or the plan to develop information technology (2002), the electronic commerce law (2003), the fourth development plan (2004), the document of comprehensive system of information technology in the country (2007), the law of country's services (2007), the law of publication and free access to information (2009), the fifth development plan (2009), and the sixth development plan (2016).

In addition to these laws and regulations, several institutions and councils have been formed and vested with some responsibilities and duties to realize e-government. The three most notable among these are the Supreme Council of Information Technology, the Informatics High Council, and the Supreme Council of Information.

However, neither the multiplicity of laws and supporting documents nor the creation of multiple institutions and councils to develop ICT has been able to realize the anticipated goals of e-government.

Studies on the status of e-government, and especially those on the fulfillment of the laws and regulations to support the continuous development of information technology and electronic services, reveal that although the presence of different organizations in electronic space has seen a significant growth quantitatively and the process of providing services through government websites is growing and improving, in terms of the stages of e-government establishment, the majority of government sites under study (conducted by the office of new technologies of parliament research center to analyze and prioritize public electronic services in the country and a survey of 55 public organizations in Iran (the basis of analysis in this study is the investigation of governmental websites on the basis of the UN model's five stages of maturity of e-government)) are in the process of upgradation and development, and therefore the objectives anticipated in the planned laws are not realized. In addition, the report's findings show that the providing of services by the websites of organizations and institutions related to learning and economic activities was better than those of cultural and social organizations and civil services; and therefore the websites of institutions such as the Ministry of Education, the Ministry of Science, Research and Technology, the National Education Measurement and Evaluation Organization, universities and banks, statistics center, etc. are the pioneers in providing electronic services (the assessment report of proper implementation of Article 13, Budget Law 2007, 2008).

Another important point is that one of the key measures of information linkage between public

organizations has not been established or just partially established. The main reasons for the imbalance between executive organizations in e-government activities include the lack of determined responsibility, the lack of coherent planning, the lack of informational support by institutions for each other, and the lack of proper coordination between these institutions. Therefore, e-government policymakers should prepare the necessary context for rapid and cheap information exchange before drafting new laws. Moreover, informational support between various institutions is essential for providing electronic services and preventing wastage of resources. On the other hand, the performance of e-government operations without preparing the appropriate infrastructure, relying merely on equipping offices and organizations with modern technologies, and establishing websites would not have the desired results. In addition, recent reports from the e-government establishment and the degree of realization of the laws' anticipated goals and supporting documents suggest that according to global and standard e-government development indices, the anticipated results and objectives have not been achieved yet. According to the UN's E-Government Development Index, Iran is placed among the moderate countries (from 25 to 50) in this regard. The index listed four categories of countries – highly desirable (75 and above), desirable (from 50 to 75), moderate (from 25 to 50), and undesirable (less than 25) (UN 2014).

Also in terms of progress of the government's main sites as per the five-step framework of e-government development, a survey of 55 sites in Iran showed that only four websites are developed for complete transactions, and though most websites have good notification status (compared to other aspects of services), very little transactional services are offered by them.

On this basis, it seems that the development of e-government in Iran has not been good as compared to other countries, and the progress too has not been in accordance with the anticipated plans and objectives, and it faces obstacles and challenges that need to be addressed in order to achieve the government's anticipated goals. The remainder of this section will refer to some of these challenges.

## Challenges to the Realization of E-Government in Iran

As previously discussed, notwithstanding the fact that Iran has performed some actions for the preliminary implementation of e-government, the main orientations of the country in this area indicate that the implementation of e-government has not been realized. However, given the extent of the phenomenon and the requirements of the modern world, progress in this area requires removing some challenges. An inspection of the current situation on the process of implementing the e-government project shows that some of these challenges pertain to the vastness in terms of nature and importance of e-government and its related requirements, and some of them are due to the infrastructure situation and features of countries like Iran. Some of these significant challenges include:

1. **The need for management support**: Undoubtedly, one of the most important factors in the implementation of projects such as e-government is senior managers and committed leaders who are charged with the responsibility of leading and controlling their implementation. In the context of e-government project implementation, it requires broad changes in government structure, sufficient investment, coherent planning, as well as the participation and cooperation of different sectors, and so the need for full support of senior management is more crucial. In other words, the managers tasked with the implementation should be capable enough in political and executive areas on the one hand, and they should well perceive the need for IT, make the appropriate changes, and remain committed to it, on the other hand.

   The experience of countries with high levels of e-government capacity and development indicates that one of their key features is the determination and commitment of senior

management has led to the approval of strategic e-government plans in the highest echelons of their governments. This commitment has led to the inclusion of e-government in the laws pertaining to the overall development plans of those countries. In this area, a look at Iran's e-government status reveals that notwithstanding the efforts made in the implementation of e-government, the top management in the country has failed to address this phenomenon and its related issues to the extent required.

2. **Expertise and knowledge required to use information technologies**: A major prerequisite for the effective use of ICT in society, particularly among the staff of government organizations, is expertise and knowledge. Certainly, exploiting ICT, particularly in public organizations, and maintaining the technology infrastructure require people with IT skills.

   The staff of government organizations should be familiar with new tools and systems as well as have the ability to work with them easily. In addition, government agency managers should also be trained in the area of applying IT.

   An examination of the status of employees shows that they (especially those in the public sector) are not familiar enough with the capabilities and effective utilization of ITC. In such circumstances, they have to work as per their previous work patterns, and they cannot use the features of the new systems optimally. Moreover, public sector managers do not have the expertise and also not trained enough in the application of ICT, and so they have less incentive to use new technologies. In order to resolve this problem, there is a need to establish educational systems with better quality so that government agency managers and employees are able to adapt themselves to the needs of developing ICT and the accompanying changes as well.

3. **The need for sufficient capital and funding**: The implementation of e-government encompasses many projects that need huge finances. Accordingly, the high level of funding needed is a major issue with the implementation of e-government in most countries. On the one hand, an e-government project needs the development of telecom infrastructure to reliably take advantage of the benefits of new technologies and communication tools. On the other hand, given that the optimal use of ITC for e-government requires an expert workforce, therefore grooming and training of such a workforce requires budget and capital. On this basis, the lack of required capital and funding is one of the main problems and obstacles faced by many countries in the implementation of e-government.

   **Lack of appropriate infrastructure**: The development and implementation of e-government, on the one hand, requires necessary legal support, and on the other hand, it needs institutions to facilitate the procedure as well as help in coordination and guidance. The experience of countries successful in implementing e-government suggests legal support and backup for projects (at the macro-level of developmental programs). The existence of a legal framework is very important for systematizing the establishment of e-government. Moreover, structural changes in organizations to facilitate e-government as well as the formation of coordinating institutions in this regard are common features of countries with highly developed e-government. An investigation of this phenomenon in Iran suggests that the current structure of government agencies is not particularly suitable for taking advantage of ICT. In addition, different public organizations now use different systems at diverse levels and have different functions, contrary to the e-government objective of integrating and organizing various government services. Thus, a basic requirement for realizing e-government is to review and improve this area. On the other hand, the lack or the low capability of ICT infrastructure is one of the primary challenges to e-government implementation. The ICT infrastructure not only comprises telecommunications and computer equipment but also e-readiness and ICT

literacy. The information and communication technology literacy refers to the use of digital technology, communications tools, and/or networks to access, manage, integrate, evaluate, and create information in order to function in a knowledge society. On the other hand, digital divide (the gap in opportunities between those with access to the Internet and those who do not) is another challenge. This is because those who lack access to the Internet are unable to benefit from e-government services.

4. **Public-private partnership in the implementation of e-government**: A partnership between public and private sectors is very important for the rapid realization of e-government. Compared to public sector organizations, their private counterparts have seen faster implementation of new technologies as well as significant progress in e-commerce. Hence, the private sector would be highly effective in promoting e-government. In addition, private sector personnel are better trained in ICT use and thus have better adaptability to the consequent technological changes as compared to the public sector, and therefore private sector employees have more incentives to exploit new technologies.

   The above description makes it evident that the participation of both private and public sectors is important for the realization of e-government. In the public sector, ministries and government agencies and, along with small and medium economically active enterprises in the private sector, private companies that are active in ICT would play key roles. However, due to the state structure of Iran's economy, the main thrust is on the government to promote efficiency and productivity of economic activities by improving its administrative and management systems. In such a situation, the government faces serious challenges pertaining to the need for adequate funding and capital as well as the need for adequate staff (given the absence of an active force within government agencies familiar with new technologies and the limitations of government budget as well).

5. **Challenges concerning security and privacy**: Like in other countries, one of the major issues with e-government is the security and privacy of people as well as setting up secure and reliable communication networks. E-government enables the government to interact with businesses and citizens in order to access governmental services. Such interactions involve the transfer of large volumes of data and information, and this trend is increasing by the day. Hence, in order to increase e-government efficiency, particularly in the area of Internet-based systems, the citizens and other entities interacting with government agencies should be assured of the safety and security of their data and financial information so that they could trust the public sector to have installed the necessary security principles in all governmental systems and interactions.
6. **Creating a cultural context**: The adoption of modern technologies to access governmental information and services entails great changes on the cultural and social fronts as well as in governmental structures. Creating awareness about ICT and its benefits among citizens as well as adapting to the fact that e-government entails services being offered in a new ICT-based manner would require training and attempt on a large scale.

   Many people, including government employees and citizens, may not be motivated enough to take advantage of ICT due to diverse reasons, including the fear of changes, etc. On this basis, the government faces a challenge to find ways for persuading and encouraging people to use new technologies.
7. **Resistance to e-government as a change**: Employees' resistance to change has always been the main challenge to all successful innovations. E-government is a new phenomenon and complex as it entails a transformation from manual work methods to electronic ones. These changes will create a new advanced environment, which will be completely different from what government departments have been used to for years. Many employees perceive the implementation of e-government as a threat to their powers, positions, and jobs.

Creating incentives for employees to learn and adapt as well as implementing plans to embrace employee participation across all stages of the change process can successfully overcome employee resistance. To decrease resistance, employees have to understand the importance and significance of e-government systems and that their jobs were safe. At the same time, the employees can be reassigned new roles through retraining and skill developments. Moreover, it is very difficult to forego traditional work methods and learn new ones within a short time.

These are the major challenges in the implementation of e-government. Although these are not the exclusive problems related to e-government, overcoming them successfully is necessary for the effective implementation and development of the new system in the public sector.

## Conclusion

E-government is a free flow of information that enhances the effectiveness of knowledge, relationships, opportunities, and time. Related tools (Internet) change the way citizens interact with each other and their relationship with the government, the relationship between government departments, and their relationship with the private sector. Regarding the rapid development and penetration of this phenomenon (for instance, e-commerce penetration in the global economy in the recent past), the transition from the traditional system of governance to e-government looks inevitable for many governments. Investigations suggest that e-government is being implemented in Iran in order to evolve administrative systems (in the form of evolution plans) and to bring about changes in government applications, fertilizing working processes and procedures as well as increasing accountability and clarity. Within this framework, the Iranian government has promoted e-services based on the concepts of participation and accountability as well as facilitated the procedure of service delivery.

However, the study suggests that the anticipated targets for e-government have not been realized in accordance with what was planned originally. Therefore, government departments need to improve their performance regarding the fulfillment of e-government assumptions (better services to citizens and better accountability). In many countries, especially in developed countries, astonishing changes have occurred in the area of e-government despite the challenges facing its implementation. However, the aim is not exactly to increase Iran's rate of adoption of e-government to match the other countries, but learning from the experiences of those countries would provide more appropriate and logical solutions to boost the implementation of e-government and to remove obstacles. Therefore, in order to improve the realization of e-government, it is necessary to pay attention to some essential points, one of them being coherence in plans associated with the project. Also, e-government should be given priority in the country's development plan, and it should be supported with more applied researches at the same time. Moreover, it is important to realize that e-government entails new processes and changes in relationships between the public and sector and citizens as well as the other sectors that use government services, and therefore they have their own requirements. Realization and improvement of e-government require strong management and leadership; strong management can ensure long-term commitment of resources, expert workforce, and other resources and capital needed for creating and exploiting it.

In this area, the government has to create and examine new relationships between citizens and the public sector, between government departments, and between private sectors. Being citizen centric by providing them optimum services is the prime vision of e-government, and policymakers should integrate this in the system design, policymaking, and planning related to this area. We hope that e-government will move toward the anticipated goals of facilitating and optimizing service delivery to citizens and also be integrated in the framework of our cultural values and societal issues.

# Development of E-Government in South Africa

Liza Ceciel van Jaarsveldt
Department of Public Administration and Management, University of South Africa, Pretoria, South Africa

## Introduction

Since 1994, the development and use of e-government services in South Africa have moved through many different stages, some more prosperous and successful than others. Some presidents, for example, Nelson Mandela and Thabo Mbeki, strongly emphasized the use of technology and e-government for development in South Africa. According to Jensen (2001, p. 4), this emphasis led to the development of the best information and communication (ICT) infrastructure on the African continent. However, the current President, Jacob Zuma, does not share this view of the importance of technology and e-government, as can be seen in the World Economic Forum Information Technology Report 2015, that has shown South Africa's ICT status deteriorating. South Africa lost three places in the 2015 report, resulting in the former leader of technology and e-government on the African continent now being ranked third, behind Mauritius and the Seychelles. The United Nations 2016 E-Government survey also ranked South Africa third on the continent behind Mauritius and Tunisia.

This entry presents a historical perspective of the development of e-government in South Africa. The entry used a qualitative research methodology to determine how e-government services developed in South Africa since 1994. First, the entry started with a review of scholarly literature related to the development and use of e-government in South Africa. From the review of literature on e-government, it was determined that a number of related terminologies, for example, technology, information and communication technology, social media, the internet, mobile phones, smart phones, and access to technology, affect and relate to the development and use of e-government in South Africa. Secondly, literature relevant to government policy on the development and use of e-government was identified and reviewed. Thirdly, a literature review of the current use and status of social media platforms in South Africa was conducted to assist in providing a theoretical perspective for this entry. These three themes were used as a framework to determine how e-government services developed since 1994 and what the current status and level of use of these services are.

## Historical Development of E-Government in South Africa

In 1994, with the first democratic government being elected, South Africa entered a period of transition, growth, and change. After 1994, government in South Africa underwent various changes and transformations. Moving from an apartheid state to a democratic state with a majority rule system posed many challenges. Many of these challenges have remained to this day, more than 20 years after the first democratic elections were held. They include a lack of housing, poverty, a high unemployment rate, and a lack of providing quality education and adequate health care. Given these challenges, the use of technology was viewed since 1994 as a tool to support and promote development. According to Cloete (2012), the new South African government acknowledged the important role of e-government in supporting public service delivery early on. This is evident in a speech that former President Nelson Mandela (**1994–1999**) gave in Johannesburg in 1995: "[S]cience and technology need to be exploited to the full . . . [W]e need to develop industrial processes and technologies which are appropriate to our local conditions, our climate and our needs to create employment" (South African History Online 1995). During the same year, on 3 October, he also stated: "[N]ot even the most repressive regime can stop human beings from finding ways to communicate and obtain information. This applies in equal measure to the information revolution sweeping the globe. No one can roll it back. It has the potential to open communications across all geographical and cultural divides . . . Converging developments in the fields of information and communications offer immense potential to make real progress in this direction. If developing countries are to make use of the chance to join the super-highway, there is a need for a special effort to build the pool of human resources . . . [A] massive investment in education and skills transfers is essential if the South is to compete in the global communications marketplace" (Mandela 1995). This speech formed the basis for the move in South Africa towards participating in the information society, which was also linked to the macro socioeconomic policy envisaged then. During this time, the Telecommunications Act, 1996, came into effect and the National Telecommunications Forum was established to improve nationwide access to telecommunications. During 1997, Mandela reaffirmed his view of the importance of technology: "[O]ne of the wonders of modern age is that we can overcome many of the obstacles that nature and misfortune impose on us. If we all co-operate to use the technology that is available, then there is little that can stop us" (South African History Online 1997).

This view was further advocated by former President Thabo Mbeki (**1999–2008**) at the G7 meeting of the Information Society in Brussels: "[W]e must strive to ensure that each individual whatsoever his or her station in life play a meaningful role in decision making and in governance. One of the ways this can be done is to ensure that citizens have access to information" (Mbeki 1995). Mbeki focused on electronic training and education and an increased public awareness of the importance of ICT literacy. Moreover, he promoted universal access to public telephones in schools and hospitals, especially in the poorest parts of South Africa. This included the erection of 2.69 million new telephone lines in remote, disadvantaged areas (Singh 2010). These landlines supported the development of telecenters in disadvantaged areas that created community access points at multipurpose community centers, cyber labs, public information terminals, and public libraries.

These service centers were created as a one-stop center where government, as well as other service providers, could provide services and information to local communities that probably would otherwise not have had access to information technology (Thlabela et al. 2006). During this time, South Africa experienced a "boom" in technology, as it was evident that government was committed to the growing information society and it propagated the benefits of using technology in government (Department of Communications 2016; Fraser-Moleketi 2002). The *Green Paper* (DOC 2016, p. 15) formulates the view of the

South African government regarding the influence of information technology as follows:

> [T]he increasing pace of technological innovation such as the rapid integration of the Internet and other telecommunications based activities into nearly every sphere of life has given rise to new ways of communicating, learning and conducting business. The Internet has facilitated the establishment of a borderless environment for communications and the electronic delivery of certain services. Convergence of technology is the major driving factor that contributes to the exponential growth of electronic commerce. Convergence goes beyond the use of technology to develop new products and services and is seen as a vehicle to improve the quality of life of society in South Africa and other developing countries (DOC 2016, p. 15).

Along with the *Green Paper on E-Commerce*, the Department of Public Service and Administration (DPSA) was mandated to promote the use of information technology in order to improve public service delivery in South Africa (DPSA 2009a). The Minister of Public Service and Administration was responsible for policymaking with regard to electronic government and published a formal e-government policy in 2001. The policy outlined a 10-year plan for implementing e-government services in South Africa, with the goal of transforming the interaction between government and society from paper-based interaction to electronic interaction. Another project that the DPSA undertook was developing the State Information Technology Agency (SITA) in 1999. The SITA focuses specifically on providing information technology products and services effectively and efficiently across the three spheres of government. Another initiative during this time was the creation of the Government Information Technology Officers Council (GITOC) (DPSA 2009b). This Council assisted government on a continuous basis in enhancing service delivery for citizens (DPSA 2009b). The Council also participated in formulating and developing an information technology security policy and procurement guidelines for information technology (DPSA 2009b). Apart from the GITOC, the Department of Science and Technology (DST) promoted the importance of technology by providing South Africa with an information technology roadmap for the future (DST 2009). Various e-government initiatives were developed by the South African government, which showed its commitment to the use of technology in government. An important e-government initiative that the DPSA undertook was the development of the South African Government Online gateway. This gateway or portal, which was initiated in 2002, is a single electronic gateway that facilitates access to all information about and services provided by the government. Since its inception, the South African Government Online gateway has increased government information that is available to the public. After the inception of the South African Government Online gateway, other e-government projects were initiated, for example, the Cape Province Gateway project, Gauteng Online, eSchool Cyberlab, e-Filing for tax purposes, e-Justice, the national automated archival information retrieval system (NAAIRS), and the broad-based black economic empowerment website (B-BBEE) of the Department of Trade and Industry (DTI). During this time, all national and provincial government departments and many local governments, specifically in large metropolitan municipalities, developed their own websites to share information (Farelo and Morris 2006).

Apart from these initiatives, the Public Administration Management Bill (No 47 of 2008) confirmed the importance of using information technology in government by stating that a "minister must promote the use of information and communication technology in institutions to enhance the efficiency of their internal and administrative operations." This includes designing a framework to facilitate and coordinate the development and enhancement of electronic services and to create a positive environment for the use of e-government services in South Africa (Public Administration Management Bill 2008, p. 10).

Between **2008 and 2009**, Kgalema Motlanthe was President of South Africa, but he was viewed as an "acting president" between national elections. In this short term serving as the president, he was not able to make radical changes or contributions to the development and use of technology and e-government.

Since Jacob Zuma (**2009 to current**) became the President of South Africa, the use of technology for development and service delivery steadily declined, as can be seen in the World Economic Forum Information Technology Report (2015) and the United Nations 2016 E-Government survey. President Jacob Zuma faced many challenges, for example, service delivery protests that turned violent, the Marikana massacre, controversy over money spent to upgrade his personal home in Nkandla, power cuts due to old infrastructure that was not maintained, xenophobic attacks against foreigners, the controversial appointment and dismissal of ministers as well as the appointment of incompetent leaders to senior positions in government, local government election results that saw the ruling party losing support, and the collusion between business, his own private interest and government (Munusamy 2016). (Matavire et al. 2010) found in their research on e-government implementation that "some leaders at the top management and government level . . . seem to have lost touch with the e-government needs on the ground." This statement clearly indicates the lack of interest by the government to support and promote the use of e-government services. The National Development Plan (2011, p. 162) states that, compared to other nations, performance of ICT is slipping down international benchmark rankings, while communication quality, speed, and cost are also significantly worse in South Africa. According to Cloete (2012), the GITOC published a new draft framework in June 2011 to support a government-wide ICT strategy. The aim of this framework was to identify new priorities that government earmarked to support the use of ICTs and to make a renewed commitment to promote e-government. However, this report does not contain concrete steps and it has failed to deliver (Cloete 2012). Lesame (2013, p. 73) concluded that ICT use in South Africa is declining after studying national and international data. While Padayachie (2010) states that due to the unsuccessful follow-through of government policies South Africa experienced ICT deployment challenges. In addition (Gillwald et al. 2012, p. 5) are of the view that a lack of effective policy implementation resulted in an uncompetitive market structure, compromised regulatory effectiveness, and weak institutional arrangements, which left South Africa dropping down international ICT indices. The authors continue to state that the high cost of broadband remains a challenge that causes a lack in growth and development for the country. Van Jaarsveldt and Wessels (2011) found that most of government's e-government initiatives are based on information sharing with citizens. The South African Government Online gateway is a good example of this. The gateway offers government information as well as a subscription service to citizens, which enables them to request government information to be e-mailed to them on a regular basis. This gateway uses Web 1.0 technology that is characterized by providing text or written information to users and a one-way flow of information. Although e-government projects in South Africa remains limited, some progress has been made, especially with the use of social media to communicate with citizens – as can be seen next.

## Social Media Use in South Africa

A review of information technology applications in South Africa indicates that South Africa currently has 4,131 million main telephone lines in use, with the best developed telephone system on the African continent. At present, South Africa has 85 million mobile cellular telephone users for a population of 53, 675, 563, which indicates that some citizens are using more than one mobile telephone (World Fact Book 2016). Of these mobile phones, an estimated 60% are smartphones, with the majority of users (84%) making use of prepaid payment services instead of contracts (Shezi 2016). Since 2016, South Africa had 27,868 million internet users, which is an increase of 1.9 million from January 2015 (Shezi 2016). This means that 53.3% of South African households have at least one member who uses the internet at home, work, university, or an internet cafe. The major reason for the increase in internet usage is the accessibility and use of smartphones, as fixed broadband usage is still limited at 5.3%

(Mzekandaba 2016). This shows the important role that smartphones are playing in South Africa. Important to note is that Statistics South Africa (2016) has found that most of these smartphone users are located in big metropolitan cities in the Western Cape and Gauteng, with some rural areas still having little or no access to the internet. In addition, big metropolitan cities such as Cape Town, Johannesburg, and Tshwane have started providing free Wi-Fi hotspots to their residents. The City of Tshwane connected 700 free Wi-Fi hotspots while 408 of these hotspots can be found in Johannesburg, providing residents with more opportunities to access the internet (Mzekandaba 2016).

With the increased use of the internet, South Africans are becoming more interested in information and giving their opinion on blogs and on social media. South Africa currently has 13 million active social media users according to Shezi (2016), while Snyman (2016) and the Internet World Stats (2016) indicate that South Africa has 13 million Facebook users. This gives a good indication of the popularity of Facebook in South Africa. Snyman (2016) also states that 77% of Facebook users in South Africa access the platform by means of their smartphones. The ten most popular social media platforms being used, including Facebook, are WhatsApp, Facebook Messenger, Google+, LinkedIn, Twitter, Pinterest, Instagram, BBM, and Skype. According to Shezi (2016), this is an indication of South Africans preferring instant messaging platforms to enhance communication with friends and family.

Although most of the e-government initiatives undertaken by government, as mentioned above, are based on information sharing with citizens, progress has been made in the use of social media. Of the 47 national government departments, 23 are available and active on Facebook, including the Department of Arts and Culture, the Department of Health, the Department of Higher Education and Training, and the Department of Tourism. The Presidency also uses Facebook to share government speeches and important policy issues, giving Facebook users the opportunity to make comments and share their views of government programs and activities. Other information, discussed on the South African government Facebook page, includes registering for government elections and the "batho pele principles." The meaning of these principles is that a better life could be obtained for all South Africans by putting people first. The principles indicate government's commitment to providing services to citizens. To date, 159,389 people have indicated that they like the South African government Facebook page (Facebook 2016).

Various South African government departments are using not only Facebook to communicate and interact with citizens but also Twitter. Of the 47 national government departments, 21 are using Twitter. This includes President Jacob Zuma who has 410,000 followers (Twitter 2016). Apart from Twitter, the South African government makes use of YouTube to share videos on, for example, bullying in schools, protecting our rhinos, and explaining how the justice system of the country works (including episodes of Let's Talk Justice) (YouTube 2016). Currently, 12 of the 47 national government departments use YouTube, although views are limited, ranging from 28 for the Let's Talk Justice videos to 37,854 for a debate on the State of the Nation Address in parliament. Only four national government departments, including the Presidency, the Department of Economic Development, the National Planning Commission, and the South African government, use Flickr, while the Department of Arts and Culture is the only national government department that makes use of Pinterest.

From the above examples, it can be seen that government, similar to the citizens of South Africa, is using social media platforms for improved communication. However, it is also clear that government sites on the different social media platforms do not have a major following or support. Government should pay attention to this shortcoming by making their sites more interesting and inviting for citizens, for example. If government takes into consideration that the number of citizens using their smartphones to access the internet and social media platforms is increasing, it could benefit government to use these platforms optimally, especially given their increasing popularity. More government departments and local governments can easily start using social media platforms to reach citizens more easily and

communicate with them more clearly. It should be noted, however, that these social media platforms only support communication between government and citizens and the sharing of information and views; they do not provide actual services, as could be done by undertaking proper e-government initiatives.

## Future Challenges and Opportunities for South Africa

At present, all government departments are supporting technology initiatives in South Africa since all of them have a webpage. Some national government departments are also making use of social media platforms although they do not have a big following. Most of these government initiatives aim at sharing information and they have done so for some time. The next phase of technology projects and e-government strategies in South Africa should therefore be developing and focusing on progressing from information dissemination to additional and improved service delivery by expanding the e-government services currently available. Government should aim to enable citizens to become more involved in online communication, transactions, services, and activities.

In the future, the main challenge for a country like South Africa is to become increasingly proactive rather than reactive in developing information and communication technology. This will require of the South African government not only to focus on promoting ICT but also to pay attention to policy implementation and regulatory assessments. South Africa already has a strong base that was created after 1994. However, it is important to continue building on this base and to improve constantly and move forward continuously. Government should make its social media platforms, for example, Facebook, more vibrant and interesting for citizens. They should encourage citizens to become actively involved, give their views, and interact on various issues with government on these platforms. Government should focus on expanding e-government services as a priority. Citizens who are increasingly using technology and smartphones and who have access to free Wi-Fi in cities are ready and geared for improved and expanded e-government services.

## Conclusion

This entry gave an overview of the development of e-government services since 1994 in South Africa. It was found that under former Presidents Nelson Mandela and Thabo Mbeki, government viewed the use of technology and the development of e-government services as a priority for development. Since Jacob Zuma became the President, developing technology and e-government has become less important.

This entry further found that citizens in South Africa are increasingly using smartphones, the internet, and social media platforms. Although some government departments are also making use of these platforms for communication, their support is low. In general, the South African government has undertaken some e-government initiatives, but for the most part, these initiatives have been based on information sharing. It will benefit the citizens, government, and the economic development of the country to make the development and use of technology and e-government services a major priority that could support the growth of South Africa.

# Development of Information Communication Technology Industry and Public Policy in South Korea

Changjun Lee[1] and Yooil Bae[2]
[1]Media & Social Informatics, Hanyang University, Ansan, South Korea
[2]Fulbright School of Public Policy and Management, Fulbright University Vietnam, Ho Chi Minh, Vietnam

## Introduction

South Korea (hereafter Korea) has enjoyed spectacular growth rates since the 1960s. Since this

time, Korea's economy has grown by an average of 7% each year and its gross domestic product (GDP) per capita has increased from 158 USD in 1960 to 29,742 USD in 2017. Nowadays, Korea is the fourth largest economy in Asia and the twelfth largest in the world in terms of GDP. In addition, many Korean companies have become global leaders in areas such as: consumer electronics, automobiles, ship building, and steel to name but a few. To these ends, the well-known "economic miracle of the Han River" has transformed Korea from that of a recipient-based economy to a donor-economy and has resulted in Korea gaining elite G-20 status.

In the context of the above, several factors have contributed to Korea's impressive growth rates namely: a favorable international market, high ratio of skilled workers, centralized financial system, and highly educated workforce. Nevertheless, academics and policy-makers have frequently cited its export-orientated economy and targeted industrial policy as the primary driver of its success (Birdsall et al. 1993). In this realm, "developmental state" theorists have argued that the state not only pushes businesses to serve its interests by controlling public finance but also is committed to finding their style of capitalism to maximize efficiency for the regional development (Woo 1991).

At the same time, some heated debates have taken place regarding the nature of the Korean state and whether it can still be considered developmental following the post-Asian financial crisis. Furthermore, given the onset of neoliberalism, the Korean state has been unable to shape their economy through its traditional means, i.e., manipulating financial resources, planning industries, and promoting strategic investment (Pirie 2016). Although state elites have retained an influence on economic and industrial development, the discursive existence of the developmental state in Korea has changed noticeably since the late 1990s.

In this vein, the introduction and subsequent explosion of Information and Communication Technologies (ICTs) provides an interesting example to contextualize the changing nature of the Korean state, particularly in relation to socioeconomic (neoliberalism) and political (democratic) practices. There were four major phases of ICT expansion in Korea in 1960–1986, 1987–2003, 2004–2007, and 2008–2014, and with this in mind, the primary aim of this entry questions how these four expansionary phases have shaped the development of ICT at a national level. In terms of outcomes, this entry uses data from the European Patent Office (EPO) and United States Trademark and Patent Office (USPTO) to map the evolution of Korea's ICT knowledge space over the period 1960–2014. Finally, this entry interprets these findings within the Korean context and draws implications for developed and developing economies alike who are keen to emulate Korea's success.

## Background: ICT and National Economic Growth in South Korea

Here, economists have provided a wealth of empirical evidence on the causal relationship between the development of ICT and national economic growth (Vu 2011). In such instances, Korea has frequently been mentioned as one of the best examples to explain the relationship between ICT and economic growth (Lee and Kim 2018). Many studies have highlighted the primacy of ICT for the development of Korea's economy citing the fact that the percentage of ICT-related products and services – as a total of GDP – has increased from 9.5% to 16.9% during 2000–2007 (Onodera and Kim 2009).

From a more geographical perspective, it is now commonplace to assume that changes in the technological structure of regions materialize in the prosperity of national economies (Lucas Jr 1988). In this context, the explosive growth of ICT throughout Korea is particularly noteworthy considering that it barely existed in the 1970s but since then has become the countries dominant industry. At the same time, the growth of ICT is also interesting because it defies traditional path-dependence theory. Put differently, the relevant literature suggests that

technologies, firms, industries, etc. enter a region when they are technologically related to the regions preexisting knowledge base (Boschma 2017). However, given that ICT was not present in Korea before the 1970s has led scholars to conceptualize its emergence from a path creationist and public-policy point of view.

It is without question that the development of ICT throughout Korea was driven largely by the introduction of ICT giants Samsung and LG (Lee 2005). That being said, it is also true that a large part of this growth was driven by a series of government-led policy initiatives. Here, the Korean government adopted an advisory stance promoting polices that nurtured those research institutions, universities, and companies, etc. activity engaged in the creation of cutting edge ICT-related technologies (Larson and Park 2014). Korea established government-owned research institutes like the *Korea Institute of Science and Technology* (KIST) and the *Electronics and Telecommunications Research Institute* (ETRI). Off the back of these research institutions, the Korean government enacted several ICT megaprojects in conjunction with top-tier universities namely the *Korean Advanced Institute of Science and Technolog*y (KAIST). These government-owned research institutions fostered a domestic absorptive capacity at the early stages of ICT development. Later on, these research institutions became incubators for the development of more sophisticated technologies, i.e., semiconductor and mobile communication technologies.

As a result of these processes, Korea gradually became the leading economy in the standardization of ICT technologies (Choung et al. 2012). For example, Korea established the standardized practice for the Code Division Multiple Access (CDMA) and subsequent third generation (3G) mobile technologies. Once Korea led the standardization of these technologies, big conglomerates, such as Samsung, SKT, and LG, were able to achieve a relative advantage in the world economy.

## Methods

### Data

Recent advances in data-driven research offer new perspectives across a spectrum of scholarly disciplines including innovation public policy, while also providing the opportunity to fill the gaps in existing theories. The novel approach applied in this entry is the knowledge space methodology (Kogler et al. 2013), and it is used to map the evolution of technology sectors (ICT in this case) via information inputs derived from patent documents.

Patent documents contain a wealth of unstructured multidimensional information, enabling scholars and experts to conduct a variety of exploratory analysis depending on their purposes. To these ends, the increasing importance of knowledge in an innovation-driven economy has been well documented by Jaffe and Trajtenberg (2002). Our focus in this entry is on patents applied for at the USPTO and the EPO between the years 1960–2014 and specifically those patents related to ICT fields. The International Patent Classification (IPC)-ICT concordance table developed by Inaba and Squicciarini (2017) was applied to filter ICT-related patents. (IPC is a patent classification tree based on fundamental knowledge and technology categories, and was originally established by the World International Property Organization (WIPO) and European Patent Office (EPO).) Our analytic sample is further restricted to the ICT-related patents which had at least one Korean inventor. This geographical restriction allows us to analyze how ICT knowledge has evolved in Korea. This entry only uses the patents applied for the two biggest patent offices in the world because those are guaranteed to represent the importance of the technologies in either technically or strategically, thereby showing the essence of the evolution of one nation's knowledge space without misleading.

### Knowledge Space in ICT

To understand the relationship between individual technologies, Kogler et al. (2013) developed the

"knowledge space" methodology which captures levels of technological relatedness based on the co-occurrence of technology classes listed on patent documents. In this entry, the knowledge space modified to understand the relationship between ICT classes and their recombination patterns by constructing an ICT class co-occurrence matrix. (See Lee et al. (in press) for the details on how to create co-occurrence matrix in ICT-related patents.) More technically, we develop four non-overlapping co-occurrence matrices: 1960–1986, 1987–2003, 2004–2007, and 2008–2014 in order to capture the technological evolution of ICT in Korea.

Next, we transform these matrices in four distinct network visualizations and discuss the successes and/or limitations of Korean ICT public policy. In addition, several network indices are applied with the attributes on nodes and edges to capture the technological convergence of ICT classes. Edge weight, $A_{ij}$, represents the co-occurrence of technology classes $i$ and $j$ or the knowledge flow from technology $i$ to technology $j$ and is used to capture the convergence between these classes. Throughout the remainder of this entry, two of the most indicative centrality measures are used: eigenvector and betweenness centralities. Eigenvector centrality, $C_E(v)$, is created to measure overall influence of the nodes across the networks. A node's eigenvector centrality is calculated by its proportional value to the sum of scores of its neighbors (see Eq. 1). Therefore, a high eigenvector score means that a given ICT class is connected to many other ICT classes with high eigenvector scores.

$$C_E(v) = \frac{1}{\lambda} \sum_{t \in M(v)} C_E(t) = \frac{1}{\lambda} \sum_{t \in G} A_{vt} \times C_E(t) \quad (1)$$

where $M(v)$ is a set of the neighbors of $v$ and $\lambda$ is a constant.

Betweenness centrality, $C_B(v)$, is measured by the number of the shortest paths that pass through each node (see Eq. 2). Betweenness centrality indicates how well a node is at bridging communities within the network. Put differently, the node with the highest betweenness centrality value is the most connected ICT class and therefore has the greatest influence in the knowledge space.

$$C_B(v) = \sum_{i \neq v \neq j \in V} \frac{\sigma_{ij}(v)}{\sigma_{ij}} \quad (2)$$

where $\sigma_{ij}$ is the number of shortest paths from $i$ to $j$ and $\sigma_{ij}(v)$ is the number of shortest paths from $i$ to $j$ that passes through node $v$.

## Findings

Table 1 shows the number of patents published in USPTO and EPO with at least one Korean inventor. There are 12 technology areas of ICT: Computer input-output and Others, Electronic measurement, High-speed computing, High-speed network, Human-interface, Imaging and sound technology, Information communication device, Large-capacity and high-speed storage, Large-capacity information analysis, Mobile communication, Security, Sensor, and device network. Among the 12 classes, *Information communication device* has always been the top patented technology in Korea. In and off itself this is not that surprising considering the fact that the public policy has highlighted the importance of ICT devices such as semiconductors since the first phase (1960–1986). Table 1 also reveals that many patents have been developed in *Imaging and sound technology* and *Large-capacity and high-speed storage* which reflect this initial phase.

Next, in order to observe patenting trends between policy transition periods, Fig. 1 calculates the growth rates for each of the 12 ICT classes. During the policy phase 2 (1987–2003), the Korean government prioritized the need for a more national network infrastructure. As a direct result of this, resources for R&D in *Mobile network* technology were prioritized and this is clearly reflected in Fig. 1.

Next, the third phase of public policy (2004–2007) highlights the importance of value-

chain and service sectors. During this time period, *Security* (337%), *Large-capacity information analysis* (326%), and *Human-interface* (310%) registered the greatest increase in patent applications.

Finally, during phase 4 (2008–2014), the government attempted to foster a healthy ICT ecosystem. During this phase, patenting in the Internet of Things (IoT) increased higher than any other sector (*Human-interface* 114%, *Mobile communication* 77%, *Computer input-output and Others* 17%, *Imaging and sound technology* 7%, and *Information communication device* 5%).

Table 2 provides some descriptive statistics on the individual knowledge spaces by policy period. The large number of nodes and edges indicate that many technologies are participating during these periods and their combinational links are diverse. All the networks have 12 nodes, representing the 12 technology classes of ICT. In addition, all the nodes are connected to one another at least once so there are no isolated nodes in either network. Network density is calculated as the sum of the weight of edge divided by every possible combination of edges, representing the degree of connectivity. There are two knowledge spaces:

**Development of Information Communication Technology Industry and Public Policy in South Korea, Table 1** Patenting trends in ICT class by policy period

| | Policy period | | | |
|---|---|---|---|---|
| Class | 1960–1986 | 1987–2003 | 2004–2007 | 2008–2014 |
| Computer input-output and Others | 40 | 802 | 1,542 | 1,798 |
| Electronic measurement | 43 | 243 | 685 | 701 |
| High-speed computing | 96 | 905 | 1,981 | 1,723 |
| High-speed network | 304 | 4,170 | 12,619 | 12,331 |
| Human-interface | 38 | 475 | 1,948 | 4,176 |
| Imaging and sound technology | 273 | 4,435 | 10,847 | 11,653 |
| Information communication device | 524 | 6,372 | 20,972 | 21,926 |
| Large-capacity and high-speed storage | 348 | 4,676 | 9,355 | 7,798 |
| Large-capacity information analysis | 85 | 672 | 2,862 | 2,163 |
| Mobile communication | 5 | 801 | 4,531 | 8,026 |

International and South Korea. Network densities for both International and South Korea networks have been increased from 54 to 2,069 and from 2 to 120, respectively as the weights of the edges have grown. The increase in density is also indicative of ICT becoming more complex as these individual technology classes have been rigorously recombined. The density ratio of South Korea compared to the international knowledge space has increased steadily until the period of 2000–2004 and has gradually declined since then. This is an important point for the sustained competitiveness of Korea which we return to later in the entry.

Figure 2 provides a more direct interpretation of the individual knowledge spaces and their evolution over the four periods. The distance between the classes indicates the level of technological relatedness between them. The shorter the distance, the more related these technologies are indicating that they are likely more to be recombined.

As mentioned earlier, the first phase of policy (1960–1986) was the period when Korean government focused intensely on developing a critical mass in *High-speed computing.* As a result of these efforts, *High-speed computing* was the dominant technology in the network, and it was closely connected to *High-speed network*, *Imaging and sound technology*, and *Large-capacity and high-speed storage*. From this strong beginning, Korea then began creating its own path in ICT technologies, and as a result, the knowledge space began developing along a new trajectory. Phase 2 made the growth of *High-speed network* technology (including digital transmission, network, telephone communication, broadcasting, and transmission, reception, channels, etc.) and more specifically those technologies strongly related to *Mobile communication*. To these ends, phase 2 provides a good indication of how effective technology policy can shape the evolution of a specific type of technology. During the policy phase 3 (2004–2007), prior investments in ICT infrastructure began spilling over into other areas of the knowledge space, i.e., *Imaging and sound technology* and *Large-capacity and high-speed storage,* which were crucial building blocks for the development of semiconductors and other signal processing related technologies. Moreover, the combined fruits of these investments resulted in Korea enjoying a sustained period of tremendous economic growth particularly in the areas of mobile phone industry. At the same time, however, Korea's unrivalled fortune was about to change as a result of the upcoming iPhone era. During this time, Korea opted to rely on its prior knowledge base and continued to strengthen its capabilities in ICT infrastructure. Finally, policy phase 4 (2008–2015) closely resembles that of its

(ICT Convergence policy)

**Development of Information Communication Technology Industry and Public Policy in South Korea, Fig. 2** ICT knowledge space by policy period

predecessor indicating that not much structural change has occurred between these two periods. However, what has changed is that each technology has become increasingly connected to every other technology in the network illustrating the success of Korea's ICT convergence policy.

Table 3 provides information on the convergence of the top five ICT classes and their respective weights in the knowledge space. More technically, this information provides an insight into the relationship between these technologies as well as their overall evolution. Unsurprisingly, the most frequent combination of technologies during the first phase of ICT policy was between I*nformation communication device* and *High-speed network* technologies. During the second phase, *High-speed network* is the most frequently recombined technology. Interestingly, the combination between *High-speed network* and *Mobile communication* emerges during this period, and this will remain the most frequent pairing throughout our remainder of this entry.

Nodes attributes (eigenvector and betweenness centralities in this entry) provide useful information on influence of individual technologies in terms of their bridging power among other nodes

**Development of Information Communication Technology Industry and Public Policy in South Korea, Table 3** Trends in top five convergent ICT technologies in South Korea

| Policy period | Knowledge space in ICT | | |
|---|---|---|---|
| | Weight | Convergent technologies (A–B) | |
| (1) 1960–1986 | 50 | Information communication device | High-speed network |
| | 33 | Large-capacity and high-speed storage | Imaging and sound technology |
| | 32 | Information communication device | Large-capacity and high-speed storage |
| | 30 | Information communication device | Imaging and sound technology |
| | 29 | High-speed network | Imaging and sound technology |
| (2) 1987–2003 | 777 | Imaging and sound technology | Large-capacity and high-speed storage |
| | 527 | High-speed network | Imaging and sound technology |
| | 450 | High-speed network | Mobile communication |
| | 414 | High-speed network | Information communication device |
| | 312 | High-speed network | Large-capacity and high-speed storage |
| (3) 2004–2007 | 2,591 | High-speed network | Mobile communication |
| | 1,537 | Large-capacity and high-speed storage | Imaging and sound technology |
| | 1,180 | High-speed network | Imaging and sound technology |
| | 827 | Information communication device | Imaging and sound technology |
| | 798 | Information communication device | Large-capacity and high-speed storage |
| (4) 2008–2014 | 4,606 | High-speed network | Mobile communication |
| | 1,349 | Large-capacity and high-speed storage | Imaging and sound technology |
| | 1,166 | High-speed network | Imaging and sound technology |
| | 1,009 | Information communication device | Imaging and sound technology |
| | 966 | Information communication device | Large-capacity and high-speed storage |

in the network. To these ends, Fig. 3a, b demonstrate the evolution of individual technology classes within the Korean ICT knowledge space in terms of their eigenvector and betweenness centralities. In both of these figures, we have highlighted *Mobile communication* and *Human-interface* as these are the fastest growing technologies in their of the eigenvalue. On this point, an interesting facet is that the sheer number of patents associated with *Mobile communication* is less than that of *High-speed network* or *Information communication devices.* As such, the dominance of *Mobile communication* is due to the fact that this technology is so frequently recombined (fused) with other technologies in the network.

Next, we shift our attention to focus on how ICT policy effects international collaboration and knowledge flows. In this context, Fig. 4 shows trends in the ranking of eigenvector and betweenness centralities for the global ICT sector. Firstly, in terms of knowledge flows (Fig. 4b), a prominent feature is the increasing eigenvector centralities values of Canada and South Korea. Turning to betweenness centrality (Fig. 4d), China has shown rapid growth (explain why this is important). In terms of the collaboration space (Fig. 4c), we find that Korea is not in an important bridging position and has not been so since the early 2000s. Finally, in terms of knowledge flows (Fig. 4d), Korea had made a significant growth until 2009 but has stopped growing since. This decline should not be taken lightly if Korea wants to maintain its position as a global ICT leader. Moreover, the abrupt fall could result in them becoming a local hub (instead of a global powerhouse) which would limit Korea's influence on local communities.

Figure 5 shows ranking dynamics for *out-degree ratio* (ODR) to the overall degree in terms of knowledge flows among countries. Put differently, high ODR means high probability of being knowledge source on ICT area. Since the 1980s, Japan has shown the greatest increase in ODR and they have retained this position until today. Korea has also shown significant growth in

**Development of Information Communication Technology Industry and Public Policy in South Korea, Fig. 3** Ranking dynamics of centralities in knowledge space among ICT classes. Note: **a** and **b** represent ranking dynamics of $C_E(v)$ and $C_B(v)$ in ICT knowledge space respectively

ODR in recent years whereby it is now the second most influential economy.

However, in spite of the above, one reason for concern is that Korea has only been actively participating in the knowledge production and is not engaging in distant collaborations with other ICT-orientated economies (Fig. 4c). In this context, Korea's economic growth will continue to be less than Japan given that Japan is actively involved in both the collaboration space and knowledge production space.

## Discussion

Extending the recently developed knowledge space methodology (Kogler et al. 2013), this entry used information contained within patent documents to demonstrate how government policy successfully shaped the evolution of information communication technologies (ICT) in Korea. More tentatively, the Korean experience successfully illustrates the government's long-term commitment to fostering a well-rounded and

**Development of Information Communication Technology Industry and Public Policy in South Korea, Fig. 4** Ranking dynamics of centralities in ICT knowledge space and flow among countries. functional ICT ecosystem. For Larson and Park (2014), this commitment is evidenced through a series of R&D support systems as well public–private partnerships specifically designed for the expansion of ICT. In addition, the case of ICT also highlights the legacy of the developmental state and their intervention in nurturing domestic industries in different modes and patterns.

The growth of ICT throughout Korea began in the early 1960s when the Korean government launch their first policy phase (1960–1986) geared towards the development of ICT-related technologies. Among other things, this policy resulted in high levels of patenting in areas such as *Information communication devices*, *Imaging and sound technology,* and *Large-capacity and high-speed storage*. At the same time, this period also saw the government focus on building a domestic capability in the form of government-owned research institutions like the *Electronics and Telecommunications Research Institute* (ETRI) and *Korea Institute of Science and Technology* (KIST). As a result of this, Korea's knowledge space evolved towards *High-speed computing* in tandem with other related technologies, i.e., *High-speed network*, *Imaging and sound technology*, and *Large-capacity and high-speed storage.*

From this strong vantage point, the Korean government began to develop a well-rounded ICT network infrastructure as part of Policy phase II (1987–2003). Similar to the first phase, a key component of this phase was the adoption of specific technologies and in this instance, patenting in *Mobile communication* technologies skyrocketed. Another key facet of this phase was that Korea began to develop their own unique trajectory in ICT, and as a result of this, Korea's knowledge space evolved differently from other economies at this time.

Policy phase III (2004–2007) focused on the value-chain and service sectors, making companies, universities, and research institutions patent in demand-side technologies like *Security*, *Large-capacity information analysis*, and *Human-interface*. These technologies naturally had an influence on other related sectors, i.e., I*maging and sound technology* and *Large-capacity and high-speed storage* and it was their recombination value that made it possible for Korea to develop a comparative advantage in semiconductors and signal processing-related technologies. Colloquially, Policy phase III is known as the heyday for Korean ICT, but this relationship was bittersweet. On the one hand, ICT was doing better than it had ever done before, but these successes resulted in Korea becoming technologically myopic and unable to prepare for the upcoming new generation of ICT which was driven by the creative content and applications.

The theme of the policy phase IV (2008–2014) was broadcasting-telecommunication convergence, and the focus was to develop a healthy ICT ecosystem. This leads to an increase in the number of patents concerning the Internet of Things (IoT) (*Human-interface* and *Computer input-output and Others*). Crucially speaking, however, the overall trajectory of Korea's knowledge space had not changed much from the previous period indicating that Korea's ICT sector was no longer flexible but was becoming rigid and sticky to a specific set of technologies.

Strengthening Korea's absorptive capacity was mainly achieved through the creation of government-funded research institutions such as the ETRI and KIST. Moreover, given that Korea lacked the necessary entrepreneurial skillset to develop all the required technologies, the government absorbed this responsibility an oversaw the expansion of ICTs at this time. These research institutes also functioned as a type of triple-helix model providing synergies between private enterprises, universities, and the government. As discussed previously, the early stages ICT benefited tremendously from public R&D spending as this type of technology as too costly and difficult for the private sector develop by themselves. In addition, several institutional improvements such as the Act of Information Promotion and stricter patent laws supported the continued development ICT at this time.

In spite of the above, Korea has faced another more pressing challenge since 2010. This entry has discussed at length how the Korean government promoted the development of the ICT, and while their involvement was invaluable throughout the initial phase of development, it became a

hindrance at the latter stages of development when the industry became more creatively driven. It is precisely for these reasons that Korea's ICT knowledge space does not change much between policy phase III and phase IV despite all the efforts in ICT convergence policy (see Fig. 2). Additionally, Korea has yet to begin collaborating with ICT dominant countries which hinders its ability to take the next step in its technological development.

Broadly speaking, there is no guarantee that the government's forward-looking investment and policy intervention would be as successful today as it was in the past, given that the pace of technological change has accelerated so much in the past couple of years. Even today, new social, economic, and often ethical practices are led by industrial actors, as technological progress outpaces policy responses from the government. Under the volatile and uncertain era of Industrial 4.0, Artificial Intelligence, and Internet of Things, Korean government needs a more agile and iterative approach to help domestic companies and entrepreneurs adapt to a rapidly changing environment.

In sum, government-led policy was very effective in promoting the expansion of ICT knowledge in Korea. The results showed that the policy mix has shaped the trajectory of ICT knowledge space during four distinct stages of policy. This policy mix can provide some valuable implications for developing countries hoping to nurture an industry led by high-tech domains.

In the case of Korea, the main determinants of success are summarized as follows: (1) supporting resources to absorb those key technologies at the first phase and (2) legislating and enacting laws related to technology development and applying incentive programs to promote new path-creation. The most important thing is that these factors are not a list of policies but a series of gradual process. At the first stage of ICT development, it might be easy to accept foreign investments, technologies, and experts for government as many developing counties do lately. However, Korea focused on how to accumulate domestic ICT-related knowledge and incubate domestic human resources. This, in turn, earned some temporal and financial buffer zone for private companies to mushroom their own technologies since 1980s. The Korean case may not be replicated again in other developing countries, because local contexts vary from country to country. Rather, contextually dependent "new path-creation" including investment on R&D and human resources in ICT domain by the governments or international donors should be made for the successful growth.

# Development of Turkish Public Administration

Mustafa Altunok
Public Administration Department, Abant İzzet Baysal University, Bolu, Turkey

## Synonyms

Administrative Systems; Administrative Thought; Divan-ı Humayun; Enderun; Mulkiye; Reform; The Administration of Ottoman Empire; Turkish Public Administration

## Definition

Development of Turkish public administration represents the stages and development system that public administration thought, organization, personal system, and functioning has gone through in Turkey from the past to the present day.

## Introduction

Historically, the state is the oldest large-scale form of economic and social organization. Taking into consideration this organized nature of the state, it is possible to draw the conclusion that the administrative accumulations of societies with a historical relationship of the ruler and the ruled and state experience are also developed. It is seen that nations that achieved continuity in history are state societies. This is because they have significant advantages over others in their struggle for existence. This has not only been important for the ethnic and religious communities but also has been important and determining for the world societies for a long time. Because it would be impossible to write history in case these societies are excluded from the world history. In terms of historical accumulation and transmission, Chinese, Greek, Persian, Russian, and Turkish societies are considered to bear such a quality. Whether they are accepted to have left positive or negative marks, Turkish communities are one of the communities that holds a significant position in the history of the world in terms of both the width of demographical and geographical areas that they influenced and their time depth. From this point of view, it is not easy to narrate the development adventure of Turkish administrative tradition and the accumulation gained in this area in a short text. This study is an attempt to outline the Turkish public administration, which has been taken from the heritage of the past Turkish societies and which has risen with the things added to this heritage within the context of modernization adventure, starting from the last period of the Ottoman Empire.

## From the Traditional State Administration to the Modern Public Administration

Although it is possible to take the Turkish state tradition back to thousands of years ago, and start the topic with especially with Huns, Uighurs, or Gokturks, an evaluation based on the modern public administration understanding was made in this study since public administration conceptualization was used in the title. The present study discusses the development adventure of the Turkish public administration through the main determinants such as institutions, schools, actors, processes, and breakpoints from the late Ottoman period to today. It is important to highlight the

essential elements that constitute the public administration when it comes to the development of public administration in a country or society. Below, it will be paid utmost attention to this sensitivity.

## State Structure and Political System from the Ottoman Empire to the Present Day

One of the main factors determining the organization and functioning of a public administration is the system in which it is embodied because the characteristics of public administration are generally determined according to the system and by the system. Within this scope, it should be noted that both internal and external actors are important. As it is known, the Ottoman State territories reached out to three continents and the state was based on family bonds. Although remarkable differences exist between the characteristics and administration understanding of this state and modern Turkish Republic, there exist some similarities and continuities as well. Since the nineteenth century, the Ottoman Empire underwent changes in its monarchical structure and evolved into a constitutional system. In this sense, *the Charter of Alliance (Senedi İttifak)* document by which Mahmoud II recognized the presence of Notables (landed proprietors in Ottoman Empire) is regarded as a significant beginning. The following Edict of Gülhane (Tanzimat Fermanı) of 1839 and Ottoman Rescript of Reform of 1856 and the enactment of the Ottoman constitution of 1876 (Kanun-u Esasi), which is the first constitutional initiative, are important guides and carriers of this Westernization-centred transformation process.

At the beginning of the 1920s, as a result of the struggle for liberation, a *National Assembly* was established in Ankara and the foundations of a system based on national sovereignty were laid down simultaneously. In this context, initially the principle of "Sovereignty rests unconditionally with the nation" was adopted with the constitution enforced on January 20, 1921. Moreover, the monarchic ruling system was terminated with the law enacted on November 1, 1922 by abolishing the *Ottoman Sultanate* separated from the *caliphate* and the *Republic* was proclaimed on October 29, 1923. The caliphate institution, which was regarded as the continuation of the Sultanate, was abolished on March 3, 1924. Thus, a brand new political regime based on national sovereignty, which was completely different from the sultanate-based political system of the Ottoman Empire, was adopted. This transformation of the state regime brought along a transformation of the political structure. Instead of the system that started with the *parliamentary government* and operated by the *one-party* practice, the mechanism gradually evolved towards a system more suitable for the parliamentary system. After 1946, a multi-party system was introduced.

Since the Ottomans, Turkish political life has been frequently confronted with coups or coup attempts. Raid of 1913 on the Sublime Porte, the 1960 and the 1980 coups and the coup attempts between this period, memorandums and 15 July 2016 coup attempt illustrate this concretely. Democratic political life has been interrupted or damaged by such military interventions during the process. In fact, after the military interventions governments were toppled down, many political party leaders were imprisoned and some were executed. Each of these interventions and attempts inevitably affected the public administration system and its functioning in an adverse manner. The most concrete indication of this is the emergence of the post-coup State of Emergency legal systems and the efforts to enact a new constitution. Following the 1960 coup d'etat, the 1961 Constitution, after the 1980 coup d'etat the 1982 Constitution were introduced, respectively, and after the coup attempt on 15 July 2016 constitutional amendments were made with the 2017 referendum. Each of these interventions resulted in fundamental changes that affected the executive mechanism and public administration.

## The Birth and Development of the Modern Public Organization in Turkey

The field of operation of a public administration mechanism in a country emerges in line with the

structure, ideology, and basic characteristics of that state. It is seen that the priorities of principal and secondary founding powers are determinant in setting this scope. In this regard, Republic of Turkey has built its existence on the remains of the Ottoman Empire. The Ottoman central organization was shaped around the palace organization. In the countryside, the organization was present in the form of provinces, sanjacks, districts, and villages. One of the essential elements of the system was the application of *Timar*, which had economic, military, and administrative dimensions. It is seen that the duties and roles of the Ottoman state especially in the classical period were not as wide as they are now. Within these duties and roles, especially the *provision of internal and external security*, *establishment of justice and equality*, *taking measures to ensure the well-being and welfare of the country* were striking. From among the fundamental public tasks and services in the country, provision of security was ensured via military personnel; justice and education system was carried out through the *Ulema* (Scholars). It is seen that the rest of the public services were carried out through *guild organization and foundation mechanism* which were two developed institutional structures.

It is accepted that in the Ottoman system, a kind of Imperial Council structure called Divan and consultancy system were important in the functioning of the state. There were different forms and kinds of the *Divan* in the history of East and West. For instance *Divan-ı Humayun,* which was the most important Divan in the Ottoman Empire, was working like de facto cabinet or a consultative assembly of senior officials summoned. With the Westernization movements in the Ottoman Empire, the Divan system began to lose its former significance. It is seen that the Western type of central and local governmental organization started to be adopted as a model together with the reform movements that emerged in the last period of the State. With the reform movements that started after the Carlowitz Treaty, and gained momentum especially after Sultan Mahmud II, Western style political, administrative, military, legal, educational institutions came to the forefront. The first ministries, the modern bureaucrat schools, health institutions structured in line with Western examples, postal service, basic organizations such as Police Department and intelligence organization and first municipalities and mukhtarships at the local level, which are important pillars of the present-day Turkey at the centra-level organization, were established in the nineteenth century.

In the Republican period, public administration field of activity developed at the center of the ministerial organization, whose foundations were laid in the late Ottoman period. Looking from the current system, Republic of Turkey has built its public services and the public organization on some basic principles as a unitary state. The principle of the *integrity of the state* as a requirement of the unitary state structure, the *decentralization and centralization principles* aiming at achieving a balance between the *decentralzsed* administration and the centralized administration; *principle of equality and the legality of administration* established on the constitutional control mechanism are the main principles that determine the public administration organization. In Turkey, an organization considered to be centralized exists. Centralized organization, which is prominent in the execution of basic public services, bears a dual characteristic as a *capital organization* and a *provincial organization*. Main elements of centralized organization include basic institutions such as ministries, general directorates and presidencies in the capital city, and the *governorships* in cities and *district governorships* in the districts. In this system, where the governorship is the provincial extension of the center, governors work as representatives of both the government and the state. The governors are appointed from the centre and make and implement decisions without consulting the centre, which is called *the extent of the authority system*.

The local government organization of the Republican era is composed of *municipalities* (may have differences like metropolitan municipality, provincial municipality, district municipality), *provincial special administrations,* and

*villages*. According to the constitution, local administrations are public legal entities, founding principles of which are stated in the law and their decision-making bodies are determined by the votes by voters specified by the law in order to meet the local common needs of the provincial, municipal, or village people. The relationship between central government and local governments operates according to the *administrative guardianship principle*, in which the central government has a specified supervisory authority on the local governments.

The main types of supervision operated in the Turkish public administration system during the Republican period are divided into five. In the *Judicial Supervision*, a judicial system peculiar to continental Europe called the *administrative regime* has been adopted. *Political Supervision* involves procedures such as questioning, interviewing, and parliamentary inquiry through parliament. *Supervision by the Public Opinion* refers to a supervision type made through written, visual, audio, and social media. The *Ombudsman Supervision* emerged as a result of the establishment of the Ombudsman Institution by law in 2012. It is a type of supervision aimed at accelerating the judicial process by easing the burden of the jurisdiction without the authority of imposing any sanctions. *Administrative Supervision* covers practices such as *hierarchical supervision* which regulates the intra-organizational structure and *guardianship supervision* which regulates the relations between the institutions along with special implementations of the administrative supervision carried out by the means of supervisory agencies such as the *State Supervisory Council* and the *Court of Accounts*. In addition to these, it is important to point out that international supervision mechanisms are important in terms of the system.

## The Evolution of the Turkish Personnel System

Until the last period of the Ottoman Empire, there had been no regular and permanent public service application. Generally, during the periods coinciding with Shawwal month, public officials were assigned for a period of one year. At the beginning, there was a system which consisted of *grand viziers, viziers, governor-general, kazasker, and other senior officials* who had secondary influence after the Sultan. Overwhelming majority of them was of the origin of *Birun* and *Enderun* which were parts of the palace organization. In the last period when Ottoman personnel jobs were more developed, the essence of the system mainly consisted of four personnel classes. These were the *İlmiye* composed of scientists and members of the jurisdiction; *seyfiye* composed of the military family, *mülkiye* composed of the senior bureaucrats, and *kalemiye* composed of the officers in charge of carrying out general administrative affairs. Today, different than the Ottomans, 10 classes of service have been adopted. However, the military personnel, judicial personnel and academic personnel included in the above-mentioned four classes have also been considered particularly important during the Republican period. Their duties, authorities, responsibilities, and liabilities are therefore framed by their own personnel laws, unlike other officers. There are also differences in the training and appointment procedures of the governors and district governors which belong to the class of *mülkiye*.

From the perspective of the legal development of the civil servant regime, it is seen that *Memurin Act* passed in 1926 was one of the most important regulations. The establishment of the State Personnel Organization and the adoption of the *Civil Servants Act* No. 657 are the two most significant developments in terms of the current system. As an effort towards the administrative reform, especially the reports of foreign experts had a significant impact on translating these developments into reality. Act No. 657, which is still effective today, is based on *classification*, *merit,* and *career* principles as three basic principles. This system consists of *public personnel, civil servants, contracted personnel* and *workers*. A central examination system was adopted in the appointment of public officials in 1999, and it is accepted that this examination, which is called the Public

Personnel Selection Examination (KPSS), is determinative for the system even though occasional appointments are made externally outside of this examination system. In recent years, it has been observed that the public personnel system is within a development process centred especially on *permanent staff, flexible employment and performance supervision*.

## Administration and Administrative Schools

*Enderun*, which is regarded as one of the most qualified administrative schools known in history has a special place concerning the success of the Ottoman state. Enderun, which is accepted to have been established during Sultan Murat II period and have completed its institutionalization during the reign of Sultan Mehmet the Conqueror, is a developed palace school built on a devshirme system in which students are provided with theoretical and practical education ranging from military education, art education, politics, philosophy, and science to religion and mysticism. This school maintained its existence until the end of the Ottoman period, but its influence lessened over time and Western style schools were established. Three separate *Mulkiye Mektebi* (Cairo, Istanbul and Bosnia Herzegovina) were established in the nineteenth century in the Ottoman Empire to train administrators. In addition, educational institutions like *Sultani Schools*, Chamber of Translation, Darülfünun, Tıbbiye, Valide Schools, and non-Muslim schools were utilized in meeting the need of qualified public servants.

Among these schools, especially *Mektebi Mulkiye*, which was founded in Istanbul in 1859, has a big significance. This school has also assumed an important role in the training of senior diplomats, politicians, and administrators in the Republican period, functioning first in Istanbul and later in Ankara. With a treaty signed in 1949 within the framework of Barker Report, the foundations of American-origin public administration discipline were laid in Turkey and public administration department was established under the Faculty of Political Sciences in Ankara, and Public Administration Institute for Turkey and Middle East (PAITME) was founded in order to meet the administrator need (Altunok 2012: 173–198). Faculties of Political Science, Faculties of Economics and Administrative Sciences, and Faculties of Public Administration in other universities were added to these schools, which have functioned as a monopoly for many years as the determinant of the administrative organization. It should also be noted that public officers who received diplomas from the developed Western and northern countries play an important role in staff working in the public sector.

## Discipline of Public Administration in Turkey

The origin of Public Administration thought in Turkey can be traced back to the reflections of rulers and inscriptions such as books of government, ethical books, explanatory documents written by many old Turkish thinkers such as Farabi, Kutadgu Bilig, Lutfi Pasha. However, as a systematic field of work and a modern social scientific discipline, the roots of public administration need to be addressed more recently. In the nineteenth century, it is possible to consider the lessons taught under the roof of the *Mektebi Mülkiye* and the trained teaching personnel and publications made under the influence of the public administration studies that emerged in France as the first products of the Turkish public administration studies.

In the establishment and development of American-origin public administration discipline, the foundation of Faculty of Political Science Public Administration Department and PAITME were the main determinants. PAITME was established in the 1950s as a regional-based public administration institute like public administration institutes in countries such as Costa Rica, Brazil, Egypt, and India. This school is a product of a Middle East-oriented perspective,

and it particularly aims to provide post-graduate education to the senior public officials. Since its foundation, PAITME has been one of the institutions with a predominant role especially in institutionalizing and developing the mainstream public management discipline in Turkey both with their academic staff as well as the through periodicals such as *Public Administration* Journal and *Journal of Contemporary Local Governments*. Another important school in the development of discipline is the department of public administration established in the Faculty of Political Sciences, which has been shaped on the historical heritage of the *Mektebi Mulkiye*. This department has been a fundamental resource for many years with the academic staff and public officials they have raised, as well as the undergraduate education that has been provided. Faculty of Political Science Journal and Mülkiye Journal published by Faculty of Political Science lecturers are periodicals that have guided the discipline. PAITME and Faculty of Political Science Public Administration Department, founding personnel of which were raised in American public administration schools and which became institutionalized with the provision of education by American teaching personnel in Turkey, have been the basic guides for years in public administration discipline in Turkey (Altunok 2012: 196–211). Despite being regarded as important institutions in this field, it is possible to argue that their determinant effect declined with the establishment of various public administration departments in many universities. Today, the number of departments named public administration reached 57 in Turkish universities. When Political Science and Public Administration Departments are added to this, the number of public administration related departments affiliated to Turkish higher education system in state and foundation universities reaches 356 with daytime and evening education and distance education departments.

As can be understood from a comprehensive study conducted on public administration in Turkey, over 60 years passed after the first foundations of public administration discipline were laid in Turkey. In this sense, it is fair to say that there is a significant accumulation of public administration discipline in Turkey. However, it can be criticized that the discipline of Turkish public administration has developed under the influence of American public administration to a great extent in terms of course syllabus, topic selection, reference sources, and follow-up of the agenda.

## Conclusion

Depending on the continuity of social life, Turkish public administration cannot be considered independent from its historical roots. However, it would not be wrong to say that Turkish public administration has developed as a result of the effort to join the developed world structurally, intellectually, and functionally in line with the rising modernization efforts over time. The Turkish public administration, which was observed to be under French influence in the last period of the Ottoman Empire, has continued to develop under the American influence in the last 50 years.

# Devolution, Coordination, and Control of Accountability Reforms in Kenya

Gedion Onyango
Department of Political Science and Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Anti-corruption strategies; County governance; Decentralization; Devolved administration; Intergovernmental model; Public sector reforms

## Definitions

***Devolution*** refers to a decentralized government system where some or all arms of government are devolved. Sometimes it merely involves decentralization of some administrative or political structures and retaining of others by the central government. ***Coordination*** is where administrative instruments and mechanisms are devised to enhance voluntary or forced organization of tasks to create administrative coherence and reduce lacunae, redundancy, and managerial or implementation overlaps in the public sector. ***Control*** describes the capacity of regulatory, compliance, and oversight systems, rules, and legislations in public administration.

## Introduction

Even though political-administrative systems and processes largely draw their uniqueness from their organizational culture and environments as concerns organizational outputs, their structuration presents generic experiences relating to problematics of coordination, oversight, autonomy, capacity, and control (Bouckaert et al. 2010; Fukuyama 2013; Christensen and Lægreid 2018). Mainly drawing on contemporary public management approaches and organization theory, it is demonstrated how, in addition to mostly presenting contrary reform outputs, political-administrative reforms through devolution often come with bloated public bureaucracies, increased institutional layering, policy sedimentation, jurisdictive conflicts, and specializations. It is also shown how sometimes (or most of the times) these developments increase complexities and hybridity in public administration (Christensen and Lægreid 2011; Denis et al. 2015) and how the intergovernmental models and/or related reforms arising from such reforms establish fragile oversight mechanisms or accountability relations in public administration (Onyango 2017c). Evidences particularly further affirm that such reforms, i.e., devolution, exacerbate rather than reduce challenges with coordination and control of accountability reforms (Carroll 1989; Lægreid et al. 2016). Similarly, among others, such developments feature unique or foster related bureaupathologies while reforming political-administrative structures (Yesilkagit and Van Thiel 2008; Bouckaert et al. 2010). As such, political-administrative reforms mostly seem to bear more uncertainties despite minimal but critical changes at the end.

Relatedly, because of uncertainties witnessed during implementation of political-administrative reforms or the ambiguous tools of evaluating expected reform outputs, accountability initiatives in public organizations are mostly embraced as *window-dressing* or administrative *myths* for purposes of internal and external legitimation. Thus, administrative reforms often remain more of instrumental features than coherent and institutionalized administrative practices, processes, and culture. In this way, coordination and control designs,

especially in otherwise unsettled reform contexts or those arising from subsequent garbage can-like processes of institutional changes, present and sustain weak accountability relations between concerned administrative departments. Moreover, with increased fragmentation and associated problems of coordination, administrative executives have a tendency of focusing more on inward-looking strategies for implementation while relying less on prevailing networks and partnerships within and outside public bureaucracies. So, political-administrative reforms often face normative crises arising partly from the mismatch between organizational structuration and culture, as well as from institutional-historical factors that come with path dependence problems.

This chapter largely draws on this discourse in public governance to understand implications of devolved administration to accountability reforms and anti-corruption initiatives in particular in Kenya. The chapter particularly illuminates how institutional fragmentation of public oversight interacts with intergovernmental model of administration in the implementation of accountability reforms or related bureaucratic oversight initiatives in the public sector. Indeed, albeit findings upon which public management discourse, i.e., New Public Management (NPM) and/or post-NPM approaches such as New Public Governance (NPG) are often evaluated, draws mostly on political-administrative contexts of advanced democracies, there are also rich and plethora of findings indicating similar trends in public sector reforms in sub-Saharan Africa.

Accordingly, the task herein generally seeks to extend the latter while similarly addressing the wider horizon of developments or analyses on the efficacy of NPM and post-NPM-related reforms. A transformative approach or an organizational approach to public administration provides theoretical framework of analysis. The presentation is accordingly organized as follows: the next section locates convergences or commonalities associated with devolved administration while also identifying key implications on public accountability designs. This is followed by a focus on concerns with coordination and control, including conceptualization of the two in public administration. A transformative approach as framework of analysis is then explained followed by data source, analysis, and conclusion sections, respectively.

## Convergences in Political-Administrative Reforms for Public Accountability: A Review

The literature on public management has increasingly shown that the vertical intergovernmental specialization and authority and horizontal inter-organizational relationships inherent in the NPM and post-NPM reforms generally present widened scopes and layers of policy implementation in public organizations (Bouckaert et al. 2010; Christensen and Lægreid 2011). These have also come with structural-instrumental and cultural paradoxes or complexities that ultimately impede bureaucratic capacities for accountability and administrative responsiveness. Furthermore, structural devolution presents imbalance between political control and institutional autonomy in reform processes (Yesilkagit and Van Thiel 2008). Particularly, when it comes to addressing wicked policy problems such as corruption, which transcend institutional jurisdictions of public organizations. Likewise, devolved processes bring forth indistinctive boundaries between reforms and actual performance of public organizations. This, in turn, features less concerns with policy problem structure than with organizational design for effective control and coordination within intergovernmental administrative model (Lægreid and Rykkja 2015). Autonomization efforts, especially through agencification, can therefore be more rooted on managing symptoms than on addressing policy problems.

Again, besides producing institutional duplications, overlaps, and redundancy, structural devolution has increased concerns with establishment of effective coordination mechanisms in managing regulatory or accountability reforms across governance systems. Public administration as such has been faced with identical governance problems arising from adoption of organizational structuration, policy strategies,

or reform approaches in reorganizing political-administrative systems (Peters and Pierre 2001). That is, despite being pressured by different contextual forces, political-administrative executives have in recent years embarked on integrating policy models posing relatively similar implementation outcomes. Hence, bureaucratization strategies for reforms have been accompanied by mimetic, normative, and coercive pressures, which pose isomorphic effects on organizational designs and implementation problems in public organizations (Meyer and Rowan 1977; Peters and Pierre 2001). This has come with adoption of super-standards or recipes for reform such as devolution, hollowing out, whole-of-government approaches, etc. Other commentators have also characterized these convergences in public management as the triumph of neoliberalism through globalization that underscores border openness, efficiency and economy, transcendence and process of capital accumulation, etc.

Further to this, devolved or multilevel decision-making processes with their intra- and inter-organizational layouts have generally come with increased governmental loss of control over accountability matters across countries (Carroll 1989; Peters and Pierre 2001). These processes have also witnessed increased corruption at the local state level. This is because, contends Carrol (1989) with the case of nonprofit housing programs in Canada, "devolution of programs, without adjusting for the resulting loss of bureaucratic control, leaves governments with little information about, or control over, the people who make decisions about large expenditures of public funds" (p. 345). As such, devolved governance presents an ineffectual design for implementation of accountability reforms that compounds bureaucratic oversight problems, especially during the transition stages of devolution. That is, devolution not only features a shift in administrative authority, but it also generally initiates a shift toward decentralized bureaucratic corruption.

However, such analyses have generally been descriptive and instrumental in public management literature (Yesilkagit and Van Thiel 2008) despite increasing shift in the recent past. Therkildsen (2001), for example, writes that in Africa, it has always been "the institutional view that informs most of the actual reform initiatives, and it is NPM concepts that inspire many (although far from all) reform measures as far as efficiency and accountability initiatives are concerned" (p. 4). The instrumental-biased analyses in sub-Saharan Africa contexts also largely draw on historical-institutional and cultural structure variables. Even so, the latter is unwholesomely conceptualized and often presented as hindering the needed political-administrative reforms (e.g., Hyden 2013). Thus, normative analysis of policy reforms in these contexts is often vague, mainly, in operationalization of political-administrative culture (Oliver de Sardan 2008). Oliver de Sardan further argues that these analyses in particular ineptly correlate historical-institutional and culture leading to theoretical indeterminacy.

Such analytical frameworks have indeed rather advanced neoliberal *development administration models* of evaluating institutional reform outputs in the region. Subsequent criticisms to current state of affairs of reforms in Africa have also hardly availed alternative approaches. Most commentators have often relatively argued that reforms in developing countries largely fail because of the complex socio-structural factors, which are devoid of civic culture. Or institutional reforms and developmental programs fail because of the weighty orientation of the state politics and administration toward informal structures, mainly, neopatrimonial systems. Hyden (2013) particularly shows that arising problems with civic culture – emphasis on universalism or orientation to long-term goals, acceptance of abstract rules, and natural acknowledgment of interdependence by individual actors – in African administrative contexts hinder needed reforms. This is despite adoption of otherwise testable apposite and performing structuration of administrative systems as experienced in the West. Also because of the effectiveness of neopatrimonial systems, it has been

contended that reform processes in African contexts should *go with the grain* not against it, i.e., finding ways of utilizing cultural structures to realize needed reforms and developmental changes. Although, the above mentioned analyses, like those they seek to discredit, have are similarly trapped in neoliberal prejudices in understanding reform complexities in Africa (Oliver de Sardan 2008). Therefore, there is still need for a more comprehensive theoretical framework that can illuminate the complex nature of interactions between institutional, historical, demographic, and cultural factors, in as far as implementation of policy reforms is concerned. Whereas, at the same time identifying the isomorphic nature of such developments in contemporary public governance. It is believed here that a transformative perspective is somehow close to presenting such a theoretical framework. The role of ecological factors in shaping reform outputs is thus neither overstated nor underrated.

In addition, even though concerns with issues of coordination and control are eminent in the implementation of accountability reforms, particularly anti-corruption reforms in sub-Saharan Africa, the literature has nonetheless mentioned this in passing and sometimes rather colloquially. In lieu, there is most focus on other capacity-related dimensions such as legal frameworks or political will in the analysis of such reforms. It is shown herein that challenges in the implementation of policy reforms and subsequent problems with accountability in African contexts relatively resonate with other organizational outputs of reforms across the globe. It is particularly shown that problems with implementation of policy reforms or the pursuit of bureaucratic oversight in modern public administration arise mostly from difficulties with coordination, control, capacity, autonomy, etc. due to adoption of similar governance paradigms by contemporary governments. Public administration in Africa should, therefore, be seen as contributing to understanding rather than diverging from these global trends of governance reforms.

## Coordination and Control of Accountability Reforms in Public Organizations

Studies on public accountability, mainly on corruption and anti-corruption efforts, have insufficiently dealt on coordination and control of related reforms in public organizations. Instead, the focus, has largely been on concerns with political will needed for effective enforcement of anti-corruption legislations or on the role of ethnicity and culture which sustains the political economy of corruption hence perpetuating bureaucratic corruption in developing contexts and on the aptness of instrumental designs or the role of institutional contexts of anti-corruption strategies in public organizations or on the role of aid agencies in the creation and subsequent performance of anti-corruption agencies in the public sector or on coalition building or collective action for anti-corruption strategies across countries and between the private and public sectors. The latter have characterized by a call for vibrant civil societies and collaborative public management to assert external environmental pressures for accountable public management. Similarly, and in line with present task, other scholars hinge anti-corruption reforms within the whole matrix of public sector reforms arguing that comprehensiveness of such reforms creates apt environments for the effectiveness of public accountability mechanisms. Some also delve on the role of e-government systems in controlling accountability ills in public organizations.

However, the larger part of this literature utilizes the term coordination in a manner that hardly reflects on the weight of the matter, particularly on the implementation of anti-corruption reforms in public organizations. Consequently, although coordination comes out as a subject of concern, intricate issues posed by coordination per se have been ineptly or rarely handled in anti-corruption literature and generally in accountability reforms. In fact, even as specialized agencies, most Anti-Corruption Authorities (ACAs), particularly in sub-Saharan Africa, seem to struggle with

challenges of coordination amidst the dynamism posed by consistent political-administrative reforms. Chêne and Hodess (2009) contend that whereas centralization of core capacity, expertise, responsibilities, and resources can be appropriate, ACAs still need to interact with other organizations. That is, ACAs' "[...] success greatly depends on the cooperation and effectiveness of other institutions. Yet, the coordination of anti-corruption institutions has generally received little political and operational attention and anti-corruption efforts continue to face major coordination challenges in most countries" (p. 2).

Nevertheless, emerging evidences suggest that besides this gap, implementation of such accountability reforms has recently witnessed increased collaboration across and between relevant institutions under the banner of *collective action* approaches. In Kenya, for example, this has seen relevant oversight institutions, and public organizations create *accountability networks* for effective coordination and control of anti-corruption initiatives. The Kenyan Ombudsman or the Commission for Administrative Justice (CAJ) and Ethics and Anti-Corruption Commission (EACC) have established external horizontal coordination and control of accountability initiatives or implementation networks with both public and private organizations.

Meanwhile, *coordination* has often been conceptually confused with nomenclatures such as cooperation, coherence, integration, and collaboration despite these being inherently different. In cognizant of this, Bouckaert et al. (2010) consider coordination as a process that can be comprehensively defined as "the instruments and mechanisms that aim to enhance the voluntary or forced alignment of tasks and efforts of organizations within the public sector. These mechanisms are used in order to create a greater coherence and to reduce redundancy, lacunae and contradictions within and between policies, implementation or management" (p. 16), most importantly, where anti-corruption strategies are integrated into the civil service reform programs as in the case of Kenya. Thus, coordination practically consists of multilevel interactions (both horizontally and vertically aligned) when it comes to the implementation of policy reforms within inter-organizational and intergovernmental structures (Christensen and Lægreid 2011).

Conversely, *control* in public organizations entails "rules" (or structural-instrumental dimensions), which may (or may not) be necessarily formally defined by members of the organization (Clegg 1981, p. 545). Control has also been understood to involve steering or governance. In particular, Kenya's Public Finance Management Act (2012) defines control as "a set of systems to ensure that financial and other records are accurate, reliable, [and] complete and ensure adherence to the management policies" (Republic of Kenya 2015, p. 219). This means, control as a concept resides with the organizational infrastructure for implementation of accountability reforms. Similarly, controls can stem from informal norms, which define logics of action and decisions in public organizations (Christensen and Lægreid 2011). Therefore, coordination processes are subjected to dimensions of control or power relations present in the existing political-administrative structures.

Therefore, coordination and control designs can explain the varying prevalence of accountability ills such as corruption across countries or between inter-organizational units. Indeed, Pillay (2004) states that high prevalence of corruption in South African public sector relates to insufficient coordination of anti-corruption efforts. As such, like all other governmental programs, accountability reforms are pertinently affected by control and coordination structures. In this way, anti-corruption reforms may seem to have more to do with bureaucratic discretionary structures and behaviors. Evidences actually show that with structural devolution accountability reforms get caught in between coordination and control conflicts characterized by tug of wars between the center and semiautonomous local governments (Christensen and Lærgeid 2008). Also, the essentiality of bureaucratic authority and its effectiveness in directing ethical behaviors or the capacity

of bureaucracies to effectively coordinate and control accountability reforms embody complex interaction of organizational structure, culture, and environments as advanced in transformative approach. This is elucidated as follows.

## A Transformative Approach and Accountability Reforms in Public Bureaucracies

A transformative approach purports that public organizations feature complex interactions "between political and administrative steering, design, negotiation, diverse interests, cultural bindings, and adaption to external pressures and influences" (Lango et al. 2011, p. 169). It generally presents an eclectic ecological approach for explaining decision-making and/or implementation processes. The actions or behavior of decision-makers and administrators are viewed as influenced or constrained by a complex combination of components of organizational structures, cultures, and environmental factors. These entail composites of governance such as polity features, environmental pressures, and historical-institutional contexts of public organizations. Altogether these are considered to define the leeway, scope, and choices faced by political-administrative leaders, i.e., how political-administrative leaders "are able to balance and making trade-offs between central concerns in NPM and post-NPM reforms like central political and administrative control on one hand, and agency and professional autonomy on the other [. . .]" (Christensen and Lægreid 2011, p. 410). Transformative approach thus entails a three-dimensional perspective: *structural-instrumental*, *cultural*, and *environmental* perspectives.

### Structural-Instrumental Perspective

This perspective is grounded on both managerialistic and legal approaches to administration that underscores the formal or rational-bureaucratic organizational designs that define organizational responsibilities, goals, and relationships, as well as how different organizational parts engage toward such ends. It assumes that administrators score high on rational calculations or means-end decisions (Christensen and Lægreid 2011). As such, it is assumed that accountability "reforms may generally be seen as conscious organizational design or reorganization i.e., political and administrative leaders use the structure as an instrument to fulfil goals" (ibid, p. 411). In most cases, this perspective is constrained by challenges arising from bounded rationality, as well as organizational design. Therefore, organizational actors can be rather confined by their organizational mandates and constrain actions that may allow innovative strategies outside organizational hierarchy. This may constrain effective collaborative systems between public organizations and their stakeholders as instrumental norms define both procedural and substantive coordination activities. The former refers to line of authority and scope of activities to be coordinated, and the latter entail the contents of activities to be coordinated. Organizational members must accordingly support such decisions and activities.

Thus, instrumental features endow leaders with tight or loose hierarchical discretional powers to identify directions, procedures, and parties to engage in collaborative management of accountability reforms to achieve reform objectives. This is besides compulsory legal requirements that may direct such collaborations in the public sector. For instance, structural-instrumental structures in forms of specialized organizational designs arguably present individuals with relatively narrow range of understanding and an overview about their positions or duties. It is contended that even though this is likely to ease understanding and capacity problems within such structures, it can lead to knowledge gap in policy design and implementation. Bureaucratic legislations will also determine the scope of engagement by governmental organizations, for example, in collaborative networks for the implementation. Administrators may also face challenges in interpreting their roles in wider perspectives or

scopes of operation because public agencies or organizations "have an autonomous and influential authority based in established structures, rules, procedures, culture, traditions and dynamics" (Lango et al. 2011, p. 169).

Therefore, inasmuch as implementation partnerships or networks in public administration may address this knowledge gap and improve coordination mechanisms, among others, such networks are also not insulated from complexities. Especially, considering, for example, cultural conflicts or tug of wars between leaders in public organizations when it comes to concerns with control and autonomy. This can either promote or frustrate effective partnerships because, among others, organizational design alone can hardly build trust between various organizational parts and actors needed to bolster effective coordination systems. Hence, concerns with organizational culture so as enhance bureaucratic capacities for increased output (Fukuyama 2013).

### Cultural Perspective

This perspective focuses on sociological aspects of public organizations by underscoring the essentiality of organizational culture. It accordingly brings to attention the role of informal dimensions of formal organizations. Informal structures result from the infiltration by individual personalities laden with personal problems, conflicting interests, and politics (Meyer and Rowan 1977). These structures also entail beliefs, past experiences, values, and norms that are not coherent with normative values stipulated in organizational routines. It is common knowledge that informal norms influence decision-making and implementation outcomes in public organizations. Some of these cultural norms draw on historical-cultural or what Oliver de Sardan (2008) terms as *practical norms.* Practical norms may also stem from or present path dependence implications for reforms. The cultural perspective holds that "when public organizations are exposed to reform processes, the reforms proposed must go through a cultural compatibility test" (Christensen and Lægreid 2011: ibid).

Organizational culture may enhance acceptance or passive resistance to collaborative management formula between governmental institutions and between these institutions and non-governmental stakeholders. As such, cultural consistency either within or between partnering organizations is an additional essentiality for effective operation of organizational partnerships or intergovernmental coordination systems. Indeed, the structural-instrumental dimensions hardly address execution of organizational powers inasmuch as they endow such powers. Power relations within and between organizations and organizational actors can be better understood by understanding organizational culture. Thus, organizational culture dimensions can make it "possible to have an impersonal, merit-based bureaucracy that nonetheless is extremely poor at getting things done" (Fukuyama 2013, p. 6).

Fukuyama further observes that good procedures often overstated in structural-instrumental perspectives hardly equal to increased outputs. And neither can procedures nor processes for control and coordination mechanisms be divorced from normative measures. That is, issues of capacity for effective collaborative systems or coordination mechanisms additionally embody organizational culture as it does organizational environments. Cultural compatibility is essential for creating mutual trustful relationships, effective organizational communication, and commitment between concerned implementing partnerships of policy reforms. Organizational communication and commitment needed for effective operations of coordination and control systems are largely influenced by organizational culture and environments. The latter is also essential for creating external organizational legitimacy. Coordination and control of reforms may therefore be problematic in cases where implementation gaps arise from cultural inter-organizational inconsistencies.

### Environmental Perspective

It has been reiterated that formal organizations operate within institutional environments where they are confronted with external pressures, which

they must heed to establish legitimacy. Through such agencies as public opinions and social prestige, contemporary public organizations "dramatically reflect the myths of their institutional environments instead of demands for their work activities" (Meyer and Rowan 1977, p. 341). Myths are socially constructed norms in an institutional environment, which may ultimately perform window-dressing functions or act as symbols for reform. The environment here has often been divided into technical and institutional environments. The technical environment entails concerns with efficiency, production, and exchange that may subsequently "exert strong external determinism, meaning that an organization has to adapt to demands from the environment" (Christensen and Lægreid 2011, p. 412). Conversely, institutional environment entails "assumptions concerning the appropriate organizational structure, internal culture, recruitment policy, demography, etc." (ibid).

It has also been argued that accountability reforms such as anti-corruption efforts in African contexts stem largely from environmental pressures, arising both from internal and external agents for institutional change in these countries. Similarly, agencification approach toward addressing accountability problems in public organizations arises from institutional reorganization myths formed and spread across countries through coercive, mimicking, or normative pressures (Onyango 2017b). Intergovernmental structures and collaborative public management structures are also nothing short of outcomes from environmental pressures to, respectively, increase accountable management of public resources and effective delivery of public services. Peters and Pierre (2001) indeed contend that whereas intergovernmental relationships like devolution are triggered by context-specific pressures, they "are developing to some extent according to the trajectory of institutional relationships which is typical of that national context, we suggest that the triggering mechanisms have been, on the whole, fairly similar across the western world" (p. 131).

Nonetheless, the effectiveness of such instrumental reorganizations is a subject to the synergic interactive influence between cultural and environmental factors. These interactive processes subsequently determine implementation components such as institutionalization, internalization, legitimacy, rejection, and matching, as well as contextualization of accountability reforms in public organizations. This means that effective coordination of reform symbols largely depends on the extent to which they are inclusive or representative across organizations. This, however, often comes with negotiations, trade-offs, and modifications prior to or during implementation in the hosting departments or organizations. In short, such processes reassert the extent to which reform myths have been formed into organizational culture beyond just being features of organizational design. For example, levels of internalization of coordination and control systems in public organizations may imply effective institutionalization, legitimacy, and implementation of relevant reforms or needed organizational ethics (cf. Sims 1991). This may also mean that the technical and institutional imperatives of public organizations are fit for the facilitation of effective collaboration or coordination of accountability initiatives.

Altogether, transformative approach may assist with understanding some interrelationships between different layers of decision-making and horizontal linkages involved in coordinating the implementation of anti-corruption initiatives. Sections that follow empirically explore the case of devolved administration along these perspectives, as far as coordination and control of accountability initiatives in public organizations are concerned.

## Coordination and Control Structures for Accountability Reforms in Kenya

The Constitution of Kenya 2010 (CK2010) introduced a decentralized system of government where two of the three arms of government – the legislature and the executive – were devolved to

47 political-administrative county governments as stipulated in Article 6 and specified in the First Schedule to the Constitution. The primary objective of devolution is to decentralize power, resources, and representation to the grass roots as it involves "[. . .] the presence of local units that have autonomy and independence from the center, with clear and legally recognized geographical boundaries over which to exercise authority and perform public functions. The units are also accorded corporate status and the power to raise sufficient resources to carry out their functions" (ICJ 2013, pp. 5–6).

Many legislations have been accordingly enacted to create an effective implementation framework for devolution. Devolution should mainly steer and coordinate the needed public sector reforms, where administrative units are embedded onto the office of elected governors. The governors appoint senior administrators in the county responsible for the administration and implementation of policy reforms, including anti-corruption reforms in the counties. Accordingly, county administrators collaborate with oversight and regulatory institutions in coordinating accountability reforms in the county. Similarly, oversight roles and legislative dimensions of decision-making lay with the county assembly consisting of locally elected representatives and headed by the county speaker.

Thus, Kenya has a unitary state model with decentralized political-administrative structures in policy formulation, decision-making, and implementation across the public sector. This implies vertical-horizontal decentralization of coordination structures. Therefore, inasmuch as county governments have a leeway in the implementation of some national policies such as collection of revenues, county executives must balance their decisions with those of line ministries at the national level. This is in conformation to policy standards set by the latter, including accountability reforms. Similarly, public organizations within or outside county governments must liaise with relevant oversight institutions in the implementation of accountability regulations or legislations enforced by the latter.

Coordination and control structures for accountability reforms such as anti-corruption strategies, i.e., Public Service Integrity Programme (PSIP) framework, take on both vertical and horizontal linkages, within and outside county governance to ensure effective integration, steering, and coordination. This implies a collective action approach, bringing together regulatory authorities, private organizations, constitutional commissions, and the mainstream ministries. Consequently, there is widened scope, for example, of anti-corruption mechanisms in terms of investigations and enhancement of capacities of relevant agencies. Accordingly, there is need for effective horizontal and vertical inter-organizational linkages creating both external and internal horizontal and vertical coordination dimensions. These uniquely influence implementation of anti-corruption strategies in particular Ministries, Departments and Authorities (MDAs).

For example, institutionalization of legislations like Public Officers Ethics Act (POEA) 2003 and Leadership and Integrity Act (LIA) 2012 through PSIP framework needs "collaboration between various players for the ultimate goal of a corruption-free society for the benefit of all. This brings to fore the need for back-up and ownership of anti-corruption drive by other players" (Tuta 2005, p. 87). To borrow from Christensen and Lægreid (2011, p. 2), this is because PSIP framework exists in a combination of "vertical specialization or structural devolution with extensive use of the principle of 'single-purpose organizations' or horizontal specialization, creating a fragmented system [or] more horizontal collaboration and coordination in the form of networks, teams and projects." Super-ministries at the national government and their subunits at the regional county commissioners, county governments, parliamentary commissions, and all other MDAs should therefore draft ethical guidelines, institute accountability initiatives such as Corruption Prevention Committees (CPC) and Whistleblower Protection Policy, as well as enforce institutionalization of these initiatives in other subunits within their jurisdictions. This

implies an internal vertical coordination and authority in the implementation of anti-corruption strategies. This, for instance, requires county commissioners to create CPCs for county administration levels.

However, to further strengthen coordination and control of different accountability dimensions in the public sector, institutions like CAJ were created to address control gaps eminent in the problem structure of corruption and accountability dimensions, most importantly, those that fall outside the mandate of the ACA and other oversight institutions. That is, the Ombudsman deals with accountability ills such as unlawfulness, abuse of power, unfairness, etc., whereas ACA handles bribery and fraud. These are done through law enforcement, promotion of administrative standards, public sensitization on corruption, and promotion of ethical practices in public organizations. This has reportedly assisted with addressing the wickedness of corruption, i.e., its complexity, transcendence, and overlaps in public administration. That is, the control and specificity provided by the distinctive relationship between EACC and CAJ have somehow addressed ambiguities hitherto confronted by the former.

In addition, toward addressing issues of control and coordination, the CK2010 separated the Office of the Director of Public Prosecution (ODPP) from that of the attorney general. Investigative powers on corruption and economic crimes were accordingly conferred to ODPP. It can be argued that this reduced the red tape and institutional complexities, which had previously characterized anti-corruption reforms in public administration (cf. Tuta 2005). Nevertheless, as will be demonstrated shortly, oversight or regulatory institutions, including EACC, are still faced with poorly structured coordination and control mechanisms. For instance, EACC blames the absence of a national anti-corruption policy for the poorly coordinated anti-corruption reforms and has negatively "affected investigations, asset recovery by EACC particularly in areas, which require an integrated approach among all institutions, which may be involved in the matter. Thereby, EACC's effort to deliver on its mandate is affected" (EACC 2013, p. 62).

## The Data Source

Data draws on qualitative primary and secondary data collected between January 2015 and May 2016 in Migori, Kisumu, and Nairobi counties in Kenya. Primary data were collected through administration of structured and unstructured questionnaires, as well as conducting of in-depth interviews with relevant parties. A total 77 executive and middle-level administrators were interviewed. This included heads of department and units in Ethics and Anti-Corruption Commission (EACC), Commission for Administrative Justice (CAJ), and Transparency International (TI-Kenya). These interviews took approximately an hour. Respondents were largely selected basing on the relevance of their administrative roles to implementation of accountability reforms. Referral sampling was also helpful in identifying, creating rapport, and accessing data or interviewing administrators in studied counties. The secondary data were based on documentary analysis of surveys and auditing, annual, and media reports. Data analysis involved coding, schematization, and categorization as discussed below.

## Networks and Partnerships: A Multiagency Approach to Coordination and Control

Lægreid et al. (2016) with regard to European governments argue that traditional hierarchical coordination in public management has partly involved attempts to reintegrate fragmented administrative apparatuses. This has entailed creation of transboundary coordination arrangements such as networks, partnerships, and shared performance targets like Kenya's PSIP framework. Through such networks, a variety of new coordination practices have been designed to tackle accountability challenges. In line with this,

EACC's Directorate of Prevention Services hosts a unit called the Partnerships, Coalitions, and Interventions (Prevention). It is responsible for addressing areas considered critical in relating with other governmental agencies. This involves "[f]orging Partnerships and Coalitions and creating linkages with other organizations and institutions involved in the fight against corruption. Organizing forums for informed debate and discussion on critical issues [and] Training integrity and quality assurance officers in the public and private sectors" (EACC *website*).

Moreover, in its *Strategic Plan 2013–2018*, the EACC recognizes that partnerships and coalitions with its stakeholder organizations are crucial in the control and coordination of anti-corruption strategies. That is, EACC and CAJ are committed to expanding their partnership base ostensibly to foster effectiveness of their partnerships (cf. EACC 2013, p. 29; CAJ 2014). No wonder, in 2015 EACC further entered into a memorandum of understanding with three other institutions – Kenya Revenue Authority (KRA), Nairobi City County Government, and the Association of Professional Societies in East Africa (EACC 2015). More importantly, however, through a network labeled Kenya Leadership and Integrity Forum (KLIF), the ACA with its partners such as CAJ, MDAs, Courts, etc. exist in what Michele Gelfand and others would term as the *accountability web*. This is created "to maintain order and coordination between individuals, social systems [or institutions] create a multitude of standards to which individuals and groups are answerable, and to which these entities are judged and sanctioned" (Gelfand et al. 2004, p. 137). This accountability web presents an external-horizontal coordination regarding specific investigations and penalties that may arise in the implementation of PSIP strategies. Thus, accountability web with its horizontal linkages is intended to ensure control on accountability ills, their nature notwithstanding, that is, whether criminal, administrative, or otherwise, as well as to coordinate actions on all forms of maladministration across public institutions and agencies.

According to EACC, KLIF "is a national integrity system set up to coordinate a unified sector based strategy for preventing and combating corruption by forging alliances and partnerships with sectors across the Kenyan society" (EACC 2015, p. 67). It has 14 member organizations drawn from both the public and private sector, including the judiciary, professional associations, the civil society, and other MDAs. Using KLIF, EACC, for instance, coordinated and rolled out a 5-year multi-sector integrity strategy dubbed KIP (Kenya Integrity Plan). It is also through collaborations with KLIF Secretariat that EACC has been able to organize and execute public awareness and foster environmental-related components such as the commemoration of International Anti-Corruption Day across counties in Kenya. The control dimension of this network can be demonstrated by the fact that on 15 January 2015 a collaborative reporting of intelligence or information sharing between EACC and KRA reportedly foiled smuggling at the Port of Mombasa. In particular, credit was placed on the fact that the collaboration between these agencies witnessed some success in coordinating the confiscation of smuggled goods at the mentioned port, which included a container carrying 17,600 x 50 kilogram bags of sugar amounting to approximately Ksh 56 million (or USD 560,000).

In addition, although hardly adequate, partnerships in the areas of public accountability have somehow reduced impediments hitherto faced in the enforcement of ethical standards in the public sector. For example, it has become a requirement to any applicant for a public office to seek clearance from EACC, the police, and KRA or even from the Credit Reference Bureau so as to become a member of any committee in the counties or be employed in any regulatory authority. This has arguably fostered self-regulation through coordinating compliance with PSIP framework in the public sector. However, dimensions of administrative culture, e.g., collectivist structures and inadequate design of relevant legislations to back such efforts, including political factors, have made the impact of self-regulation and coordination efforts problematic in county administration.

Furthermore, oversight institutions through another collaborative network called Integrated

Public Complaints and Referral Mechanism (IPCRM) reportedly established effective coordination and control mechanisms that have seen increased reporting organizational malpractices in public organizations. The IPCRM was founded in 2013, and it consists of six organizational partners, which include EACC, CAJ, TI-Kenya, Kenya National Commission on Human Rights (KNCHR), National Cohesion and Integrated Commission (NCIC), and National Anti-Corruption Campaign Steering Committee (NACCSC). IPCRM brings a multiagency approach to cases on corruption and other complaints related to maladministration. Thus, IPCRM has been credited for increased reports on wrongdoing in public organizations by members of the public. For instance, in 2014 CAJ stated that it had "received 151 complaints through IPCRM, a double increment from the previous reporting period when the Commission received 73 complaints. The Commission also attended a strategic meeting in Machakos on awareness creation on the partnership" (CAJ 2014, p. 24). It was also established in Kisumu county that IPCRM coalition expanded specificity in dealing with different dimensions of maladministration such as abuse of office. This arguably improved control and coordination mechanisms through effective information sharing between member agencies. It should be noted that such collaborative operations as reported in the case of EACC and KRA above improve both technical and institutional environments of oversight institutions. Dimensions of legitimacy in oversight agencies, for example, are improved leading to institutionalization and internalization of accountability reforms in public organizations.

Notwithstanding the above, it was likewise established that KLIF or IPCRM networks have not resulted into substantive changes needed to control malpractices in the public sector. In line with findings by Lægreid and Rykkja (2015) on coordination of wicked policy problems in Norway, this was partly contributed to the existing strong vertical coordination among key individual partners in these networks and in public organizations. Consequently, deficits of coordination and control, as well as multi-organizational suboptimization, were reported in the implementation of accountability reforms in county administration. Such deficits may also allude to reassertion of vertical authority within individual organizations or units. This, in turn, creates ineffective coexistence between elements of hierarchy that, on one hand, emphasizes control and organizational interests, mandates, and responsibilities and, on the other hand, IPCRM and KLIF networks. However, this additionally poses loose and rather weak horizontal coordination capacities. It was established that this may explain, for instance, low public awareness and trust in the structural organization of anti-corruption reforms reported among administrators in county administration. In other words, there were evidences of a knowledge gap among administrators, and reportedly the public, with regard to the jurisdictive roles of EACC and CAJ.

Such challenges of coordination and control also allude to unbalanced congruence. That is, levels of organizational commitments needed in these partnerships hardly equaled to administrative cultural congruency between organizations. Organizational commitment is essential in the creation of mutual trust that can allow effective operation of such networks. In particular, mutual trust between organizations may "enhance appropriate behaviour, and individual and organizational decision-making is oriented towards confirming roles and identities [as this] may facilitate or constrain coordination" (Lægreid and Rykkja 2015, p. 479). That said, the next section further looks into implications of devolved administration for coordination and control dimensions of accountability initiatives.

## County Administration, Coordination, and Control of Accountability Reforms

The relationship between devolved structures and institutions of accountability on issues of coordination and control of anti-corruption strategies can be used to interrogate the nature of horizontal linkages in the implementation of accountability reforms in Kenyan public administration. Indeed, as anywhere else, it was established that

devolution has presented unique and increased institutional hybridity in forms of layering of reform structures, conflicting administrative cultural features, and jurisdictive specializations. These have aggravated rather than reduced complexities in the ongoing anti-corruption reforms in public administration.

That is, subsequent vertical intergovernmental specialization and authority and horizontal inter-organizational relationships have generally implied widened scopes of implementation of accountability reforms in the public sector. This has compounded challenges with control and coordination landscape in the implementation and enforcement of accountability initiatives in public organizations. It was also reported that a new set of policy reforms in the counties have generally been characterized by conflicting implementation relationships between administrative gatekeepers and those whose interests are availed by the new administrative dispensation. Devolution has therefore come with displacement, replacement, and promotion of some working groups or networks and structures. This has resulted to a largely politically charged and anarchic accountability relation in county administrations. Thus, negatively affecting operations of anti-corruption committees, whistleblowing efforts, and compliance to drafting specific ethical guidelines. Subsequently, control and coordination mechanisms for accountability get weakened.

It was established that devolution has exacerbated the already problematic organizational commitment, bureaucratic identity dimensions, and information sharing between public entities and partners toward policy implementation that has posed challenges for the realization of effective coordination of accountability strategies, most importantly, basing on the fact that the design of accountability reforms tends to transcend individual organizational jurisdictions and depends largely on the commitments of public organization actors to facilitate or own the reforms for effective implementation. That said, devolved administration in Kenya presents pertinent implementation problems of horizontal coordination and control between line ministries and oversight institutions.

Moreover, the "unsettled" situation or the transitioning nature of devolved administration was found to present increased complex implementation processes. In particular, such processes were said to be characterized by tug of wars between the central and county governments. There were also administrative tensions between employees from line ministries currently absorbed into the devolved governments and their colleagues from the defunct local authorities. Thus, transitory stages of political-administrative reforms in Kenya tend to feature operational instrumental ambiguities, partly due to the lack of clear budgeting processes; anarchic hierarchy, especially at the mid-level positions; and unclear definition of tasks between some departments. In other words, devolved structures are not coherent and do not clearly stretch to street-level administration. This was contributed to the consequent lack of effective control measures against threats of accountability ills at the local state levels, alluding to both instrumental and cultural inconsistencies as far as accountability norms are concerned in county administration.

### *The Reform Paradox*: Re-grouping of Informal Networks and Accountability Controls

Insofar as dimensions of coordination and control are concerned, the complex interaction between instrumental and cultural components in devolved reforms and inherent accountability problems in county administration was reiterated by many respondents. It was also explicit that accountability relations in county administration seem unclearly defined to foster effective control and coordination of accountability mechanisms in public administration. In fact, we may draw on this to reassert the reform paradox argument that reforms may sometimes undermine rather than foster accountability relationships. However, such unsettled or transitory status of reforms in Kenya reportedly experienced the re-grouping of informal networks or relationships that may have been threatened by devolved governance reforms. This may have partly come from the possible

trade-offs and negotiations by concerned interest groups or factions prior to or during the enforcement of punitive measures, most importantly, when it comes to handling cases of maladministration to CPCs and commitment to coordination networks at the local levels. This can, in turn, explain the established increased porosity of accountability mechanisms in county administration. This porosity partly stems from the conflicting control and specialization concerns between the central and county governments, as well as between the latter and institutions of accountability.

Again, instead of weakening neopatrimonial structures that were associated with administrative ills in defunct local authorities in the country, devolution has rather reinstituted these structures at the county government levels. It was established that these networks have incubated corruption and collective action problems to public accountability in county administration. Consequently, there was reportedly institutionalization of a complex interaction between informal and formal multilevel decision-making and inconsistent courses of action within intra- and inter-organizational relations. This also contributed to reported gap between oversight and public organizations in the effective coordination of accountability reforms. The embeddedness of accountability reforms onto political-administrative structures at local levels through PSIP framework both fragments these reforms and largely places control under the discretion of county CEOs. As such, institutionalization and coordination of accountability reforms are placed on the hierarchical and largely influenced by the quality of leadership at any particular department or ministry. Accordingly, contrary to contestations that decentering supposedly weakens the position of CEOs on matters of accountability, county administration in Kenya indicates that the control and influence of information by political-administrative leadership is complex and multilayered and does not necessarily guarantee increased accountability more especially if this relationship is understood largely within instrumental arrangements like advanced in agency theory models of administration or within post-NPM or joined-up government approaches, which favor interagency integration and reassertion of the center (Christensen and Lægreid 2008).

It was further established that embedment of accountability reforms on political-administrative structures in public management has heralded jurisdictive conflict between oversight institutions and public organizations. The latter have largely retained their jurisdictions on various aspects of management including accountability reforms or PSIP-related concerns in the public sector. Unfortunately, this scenario has been exacerbated by devolved structures owing to the powerful institution of the governor, whose influence presents centrifugal effects on key decisions and implementation directions for accountability reforms. Such partly being the case, EACC, for instance, was reportedly constrained as a coordinating agency to effectively monitor compliance with the implementation of PSIP strategies in public organizations. Therefore, coordination and control as implementation components in accountability reforms is incoherent in county administration. In particular, many of the respondents alluded that anti-corruption efforts in county governments are poorly coordinated both in terms of their contents and in terms of relationships between respective ministries, departments, authorities, and accountability agencies. That is, coordination and control aspects of accountability reforms are instrumentally and culturally inadequate in county administration.

The implementation of devolved systems has also come with expanded bureaucracy and increased demand for resources. Different studies have shown that this is indeed a key challenge to accountability reforms in most African countries. Thus, the enormous size of bureaucracy and the entrenched negative implications of collectivist culture, i.e., cronyism, favoritism, etc., hinder effective coordination and control of accountability reforms. EACC officials interviewed reiterated that enforcement of anti-corruption initiatives in public administration, in particular, has become increasingly problematic given the size of the bureaucracy. Though, it should be pointed out

that events that ushered in devolved administration were less inspired by addressing administrative accountability than fostering representation and political responsiveness hitherto unbalanced in the centralized governance system.

The largeness of public administration also brings to fore concerns with capacity issues when it comes to implementation and institutionalization of accountability structures in the counties. Indeed, some respondents correlated the inadequate capacity of oversight institutions to effectively monitor, audit, enforce, and coordinate accountability initiatives in the public sector to the largeness of the latter. At the same time, the expansive bureaucracy stemming from the adoption of devolved governance poses challenges both in terms of structure and labor, to the establishment of effective control systems for accountability reforms. For example, according to the Auditor General's 2014/2015 Financial Year (FY) report, it was stated that Migori county exceeded its payroll budget by over Ksh 136 million in the audited FY. Actually, the constrained performance of financial control mechanisms, particularly the Integrated Financial Management Information System (IFMIS), was blamed on the bloated Kenyan public sector. So, because devolution largely prevails on the enhancement of political-administrative representation, political responsiveness, and accountability, it may sometimes come with an expansive bureaucracy, which, in turn, impedes actualization of effective oversight mechanisms in the public sector.

## Conclusion

Accountability reforms founded on weak and loose devolved structures are likely to witness instrumental and cultural layering and jurisdictive conflicts of decision-making. This creates a milieu for poorly coordinated and weak control mechanisms for reforms in public organizations. Such outcomes avail capacity problems within intergovernmental model to foster effective coordination of accountability mechanisms and control maladministration at all levels of political-administrative structures. It has been advanced that organizational dimensions, particularly culture, design, and environments, present synergic relationships that make devolution a complex political-administrative structure to allow effectual implementation of accountability reforms. Devolution also creates a more politically affiliated working group at local state level with somehow hostile implementation relationships and problematic commitment to accountability reforms in public organizations.

It is further demonstrated how devolved reforms characterized by unsettled situations lead to loose accountability relations between public and oversight organizations or between ministries, departments, and authorities in intergovernmental model of administration. The unsettled situation also ushers in chaotic transition of devolved governance and brings forth institutional capacity and resource-related problems. For instance, the bloated bureaucracy that has come with devolved governance has put pressure on civil service wage bill and created capacity-related challenges for effective political-administrative oversight in Kenya. This has hindered the performance of ACA and Ombudsman as key coordinating agencies for accountability initiatives in Kenya's public organizations. In addition, the uneasy relations between former employees of defunct local authorities and their colleagues from line ministries impede adequate organizational communication, commitment, and trust for effectual coordination and control structures for the implementation of accountability reforms.

Moreover, devolution in Kenya has rather exacerbated than reduced the consolidation of clientelistic networks which seem to threaten effective control of accountability problems in public organizations. This has created a milieu for accountability ills such as cronyism, kickbacks, etc. in county administration. In this way, and as often been reiterated by studies in other contexts, even though devolution in Kenya may seem to have weakened central political-

administrative levers of control, it is yet to address challenges of vertical and horizontal coordination between public institutions and oversight institutions or between county and central governments that are needed to effectively coordinate accountability reforms. These evidences add to findings in public management that intergovernmental model is characterized by persistence of accountability problems despite adoption of otherwise apposite and elaborate reform frameworks.

# Dictatorships and Nonprofit Organizations

Palina Prysmakova
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA

## Synonyms

Authoritarianism; Cooption; Unjust regimes

## Definition

An authoritarian regime is a type of state administration, whose main goal is to support its rule and to guard against any possible inflictions of power-threatening elements. Such a state is characterized by the domination of the government in making and implementing policy, the limited autonomy of an organization in representing its members and constituents, and deliberately erected obstacles for citizens to define and voice their priorities.

## Introduction

Despite the attempt of being as much global as possible, most of the entries in the present encyclopedia refer the nonprofit sector management and its place in the society in the developed world. There, the relations between governments and the nonprofit sector are predictable, mainly because they are stabilized by the corresponding legislative base. However, even this pool of developed countries represents the diversity of administrative regimes and the variations of government-nonprofit relations created by the uniqueness of their origins. These variations occur everywhere across the globe in both developed and developing contexts. This entry aims to describe possible relationships in authoritarian states, which, despite of being highly understudied (Bohmelt 2013; Salamon and Anheier 1992), require no less attention.

Before outlining various types of relationships between a ruling group and the civil society, one should determine what can be called a dictatorship. Authoritarianism is not a uniform label, and in any theorizing about governmental relations with the nonprofit sector in authoritarian context, one needs to understand the relativeness of this characteristic of a government. What is viewed as a dictatorship by the citizens of one country could be a normal order of life for others and vice versa. Therefore, the states that one can call authoritarian would differ as for their welfare regimes, their cultural and religious traditions, or lack of them, which would shape not only the development of associational life but also determine the type of a consolidated regime.

Scholars and philosophers consider a regime being dictatorial or authoritarian using pleiades of definitions. Summing up several typologies (e.g., Bohmelt 2013; Heurlin 2010; Lee 2005), we can see that scholars distinguish personalist regimes, single-party regimes, military-led regimes, monarchies, illiberal democracies, liberal autocracies, and statist regimes. Bohmelt (2013) refers to an authoritarian regime when the main goal of the state administration is to support the rule and to guard against any possible inflictions of power-threatening elements. According to him, such a state is characterized by the domination of the government in making and implementing policy, the limited autonomy of an organization in representing its members and constituents, and the lack of citizens' involvement in defining and voicing their priorities. Other scholars like, for instance, Lee (2005) also expect that an authoritarian state often restrains freedom of associations and corresponds to the statist regime, in which the low levels of social spending are not compensated by the growth of the nonprofit sector. However, as this entry will show, there could be some notable exceptions.

## Factors Influencing Nonprofits in Dictatorships

Variables that impact the nonprofit sector either in dictatorial or in any other type of regimes could be

internal and external. Internal are those factors that determine the way in which the administration of the state and nonprofit organizations communicate inside the country. For instance, in open and relatively free civil societies, the nonprofits usually work with the local governments rather than with the central governments (Brinkerhoff and Brinkerhoff 2002). In states with more centralized governments, this dynamic changes. The functioning of nonprofit programs is strongly dependent on the favorable attitudes of a central government. The scholars uniformly claim that the relations between the state administration and the nonprofit sector is primarily determined by the type of a regime, namely, who is in power and how this power has been acquired (Bratton 1989; Heurlin 2010; Bohmelt 2013; Hasmath and Hsu 2014). Other internal variables are the longevity and stability of the regime, its strength, historical formation of welfare state, the extent of governmental social welfare spending, and the level of state capitalization.

Economic performance also plays an important role. Some highly centralized countries do very well due to their strong command economy, which usually is built up on the enormous resources they possess (Cook 2015). Thus, while their governments have the ability to provide their population with the necessary social services, it is up to them whether to delegate the provision of some of these services to the nonprofit sector. Meanwhile, when some centralized countries are economically weak, they will not have enough resources to undertake welfare functions (Cook 2015). Here, the authorities have to decide whether to allow the nonprofits to activate the external resources (Heurlin 2010).

External or international variables that determine the nonprofit-government relations are the extent to which international donors are allowed to enter the country, whether they are interested to run the projects in a particular country or to which extent the authorities fear to lose their country's autonomy. Sometimes the donors are simply not interested to support the nonprofit sector. The reasons could be diverse, and their discussion is out of the scope of the present chapter.

## Nonprofit Types

Scholars suggest that various types of nonprofit organizations can exist in dictatorial regimes performing diverse services and functions. Like anywhere else, the entire range of organizational types is present across the authoritarian states, yet, not all of them could be simultaneously found in a single country. Different authoritarian regimes would agree on different types of nonprofits to be present in their country. For example, according to a funding type, the government could accept international nonprofit organizations, local nonprofits funded from abroad (southern nongovernmental organizations depending on northern funding), local nonprofits funded by local private donors, or local nonprofits operating on government funds.

Again, like everywhere else, the functions that nonprofits would perform are diverse: there could be environmental, social care, religious, human rights, and educational nonprofits. The last two could be restricted from the political activism and the discussion of political issues (Lee 2005). The division between a nonprofit religious organization and the government is also very thin in the sacred countries, which has no legal separation between church and state, or those where the government works closely with the church to acquire a popular support even though a country positions itself as a secular state.

## Forms of Relationships

In a single country, regardless of the regime, the degrees of freedom of association could differ between the nonprofits. They may function freely, they may function freely within the limits to receive international funds, or their functioning may be strongly regulated by the state. All three types could occur in the dictatorship. The latter is achieved either through complicated bureaucratic registration and reporting requirements or through the direct suppressing measures (Hasmath and Hsu 2014; Heurlin 2010). Researchers point out that if there are any relationships between dictatorial governments and the nonprofit sector, they

could be collaboration, co-option, pressure, and elimination. First, the entry reviews how scholars describe the situation when the nonprofits function freely and have no connections with the state.

*No relations* mostly works in a way that "we do not bother you, you do not bother us." This state of affairs usually occurs when the government is busy maintaining the power or establishing the regime, for instance, fighting of clans, and thus has a limited attention to the voluntary sector. Moreover, suppressing the independent sector might be costly for a newly formed administration (Heurlin 2010). Usually, the situation changes fast as the dictatorship obtains more power. For example, the first years of a dictator's rule might coincide with the activation of the nonprofit sector. After the regime is consolidated, the ruler turns to a restrictive treatment of the free operating sector. Even without establishing any relationships, the government can still benefit from the nonprofit organizations that function in parallel to the state. Trying to remove the label of being a dictatorship from their country, the authorities often show these organizations to the international donors as a proof of existing civil society (Dupuyabc et al. 2015).

Another obstacle for collaboration could be the common lack of scientific experts in the nonprofit sector, which rather consists of grassroots movements with have high interpretive but low delivery power. In highly centralized regimes with the exception of the environmental organizations, the nonprofits usually have little professional expertise (Hasmath and Hsu 2014). Thus, the nonprofits do not produce the knowledge, but reframe it, which is of little help to the governments.

Because the service delivery usually occurs on the local level, the lack of relationships also happens when local governments have low levels of trust towards and low levels of knowledge about existing nonprofits (Hasmath and Hsu 2014). A good example is when local governments are more focused on the local development measured by the economic growth, which is easier to report to the central government than the indicators for environmental or social improvement (Prysmakova 2016). In such a situation, the need to contact and collaborate with the local nonprofits is marginalized. Nonprofit organizations equally avoid approaching the local governments, because they are aware that the local governments lack trust and knowledge of their sector.

The knowledge about the nonprofits is also determined by the governmental awareness about certain social issues and the degree of importance assigned to them. Increased awareness could lead either to the attempts to collaborate with or to co-opt a nonprofit organization.

*Collaboration* on equal, even though possible, rarely appears in dictatorships. The reasons are the prevailing tendencies of those in power to limit their partners to the family clan, party adherents, or closest allies. Also, when the lack of trust is not the problem for cooperation, then it could be the difference in the perspectives about social problems and their solutions.

However, as the practice shows, there are situations when an authoritarian government recognizes the important role of the nonprofit sector in the provision of educational and social services. Nonprofits in turn also depend on the state as a partner in social provision. Cook (2015) suggests some of the centralized governments in fact encourage and support service-providing nonprofit organizations contracting the nonprofits to deliver social services that previously were provided by the state (Cook 2015).

When the burden of welfare provision is passed to the local governments, the latter might become interested to cooperate with the nonprofits. While the majority of meaningful interactions occur between the nonprofits and the local governments, the difficulties in collaboration could be attributed to the fact that the central government still effectively controls the legal environment in which independent organizations operate (Hasmath and Hsu 2014). Further difficulties are attributed to the organizational differences between the two sectors in their forms and missions, making it hard to build mutual trust and to define a common goal.

Corporatist relationships as a case of collaboration often occur between church and state. Scholars give an example when the colonial regimes use the Christian churches to protect

from any possible intervention of the communist ideology (Lee 2005). Also, religious organizations are very capable of attracting religion and humanitarian aid through their international connections.

From the perspective of a nonprofit, however, collaboration with the government is often not acceptable or it contradicts its mission. Therefore, the nonprofit organization will try to negotiate its autonomy from the state. Moreover, because nonprofit organizations often promote liberal causes like human rights, democratic choice, or gender equality, they will start bothering the authorities just with their presence. When the independent nonprofit sector becomes politically inconvenient to the extent that it requires an action, the authoritarian government has a choice to co-opt nonprofit organizations or pressure and eliminate them.

*Cooption*, or corporatist-style institutionalization, means using the nonprofit organizations for the sake of government promotion. In response, the government assists civic organizations to provide welfare and services to the community. The nonprofits are typically called co-opted by the government when the government becomes the major funding source, and, therefore, all the decisions undertaken by a nonprofit organization require an official approval of a sponsoring agency. The autonomy of nonprofit organizations erodes, and they become homogeneous with a high degree of predictability for the state.

Being co-opted, however, does not necessarily mean governmentally funded. Besides governmental provision, such organizations could also either operate on membership fees or on private donations. Meanwhile, as another drawback, any form of state dependency could lower the activism of the nonprofits, and they could stop the proliferation of neighborhood organizations striving for a democratic change. Researchers give us an example of the colonial practice of co-opting leaders of local civic associations into the government, for instance, through inviting them to political and administrative positions, which has been a common practice even after World War II (Lee 2005). In such cases, co-option reduces the strong feelings of community ownership of the nonprofit sector (Heurlin 2010).

Potentially successful organizations are especially prone to governmental co-optation, because incorporating such organizations into the regime system releases the need from the government to be creative in solving problems. The government absorbs the nonprofits implementing their programs into the governmental system. As a final drawback of co-option, the fear of losing the credit for creative ideas might discourage the nonprofit sector to innovate (Hasmath and Hsu 2014).

*Pressure, Exclusion*, *and Elimination* include bureaucratic complications during the registration or extensive systems of reporting during nonprofits' operation. The authoritarian government might have little interest for extra administrative work to sponsor or regulate the nonprofit sector. Neither there is an incentive for the government to be liable if the nonprofit program does not perform. The way out is to prevent a nonprofit organization from completing a registration step (Heurlin 2010). To avoid this type of relationships as well as the co-option, a nonprofit might register as a business organization. However, it is also not always an easy solution. Researchers suggest that, for instance, a private organization that undertakes public tasks might find difficulties to officially establish its regional branches (Hasmath and Hsu 2014).

The most common way to deal with unwanted nonprofit organizations is the use of force. Advocacy organizations are especially prone to the brutal treatment (Nair 2011). The mass media often reports journalists' disappearance and numerous raids of special military forces to confiscate equipment and documentation of independent advocacy organizations.

Pressure on the nonprofit organizations usually occurs, when the image and the power of the government are threatened by the nonprofit sector activities. While more obvious with the advocacy and lobbying groups, service-providing organizations could become equally dangerous for the regime. By taking over governmental functions, such organizations damage the image of the government showing its passivity in regard to various hardships of the population (Heurlin 2010).

The high profile and strong power of local community groups can raise the hostility and

cause the violent intervention of the governing authorities. To address the issue, a strong governor could appoint into his or her cabinet a popular leader of a nonprofit organization who might be considered an unofficial people's mayor (Lee 2005). Similarly, a dictatorial government could recommend that a nonprofit's board should appoint a government's ally to a leading position of their institution.

In response to regulatory change, nonprofits minimize, avoid, or try to defeat new rules. Also some organizations might prefer to work illegally without officially complying with the rules. Increased regulatory restrictions, however, are not exclusive to the authoritarian states (Heurlin 2010). As the research shows, after World War II, the legislation regulating the nonprofit sector have toughen up in nearly half of world's states regardless of the regime type (Cook 2015; Salamon and Anheier 1997).

Dictatorships often pay a special attention to foreign-sponsored nonprofit organizations, which by definition have problems with organizational ownership and autonomy of agenda setting. Authoritarian governments are likely to dismiss nonprofit organizations that do not represent local population. Harassment, detention, banning, and violence are standard forms of repression for the maintenance of the external links. Although when the support comes from a well-established international donor, the nonprofit organization might be able to function allowing for the government interference.

## Variations of Authoritarian Regimes and Their Consequences for Nonprofits

Relations between centralized regimes and nonprofit organizations have some variations in their patterns. On the one hand, scholars claim that across various authoritarian regimes, advocacy and civil rights organizations are uniformly suppressed (Nair 2011). On the other hand, researchers were able to illustrate that the milder regimes allow for small-scale advocacy organizations, because those in power know that in the absence of representative governments, small public demonstrations are safe and actually help tame the unsatisfied by venting out their grievances (Lee 2005).

The pattern is clearer for the service-providing organizations, whose primarily goal is to serve the vulnerable population and to support the neglected in the existing system of social care and public education. While they still advocate, their ideas are less of a political character and thus do not threaten the authorities. For instance, supporting and encouraging the formation of organizations that advocate the equal access for persons with disabilities actually creates a positive image and improves the popular support for the state administration. Meanwhile, researchers observed that there are also some specifics in the relationship between the government and the service-providing nonprofits depending on the authoritarian regime type, which are discussed below.

*Personalist regimes* are often characterized by having no other relations with the nonprofit sector than repressing it. The main obstacles to develop a vibrant civil society are the lack of competitive opposition and the government hostility toward independent political activities. It happens in countries with single-governor regimes, because of the weakness of political-party systems. Nonprofit organizations often duplicate the role of opposition parties, because the nonprofits are often founded and staffed by opposition figures. Such situation becomes inevitable where any organization outside of governmental control automatically falls into the definition of being an opponent. The government views nonprofit organizations as de facto opposition. Any program conducted by the organizations could be interpreted as a failure of the state to provide necessary services to the public. Some of the organizations, however, have no desires or ambitions to represent the opposition. This situation creates a climate of fear and periodic intimidation. Local nonprofit organizations are generally permitted to function, while they expect home invasions, nuisances, and lawsuits. This is the kind of backlash against any activities that challenge the authority of the government. Meanwhile, some organizations with a long history and possibly

connected to the religion of a country fare better than new ones that are not religiously affiliated.

The government is extremely sensitive to criticism and independent political activity. It controls independent organizations, citizens' movements, and nonprofit mass media, which are largely funded from abroad, by restricting freedom of speech, practicing detentions, and even questionably legal killings (Backer and Carroll 2001).

International donors may exacerbate the situation by transferring funds to the nonprofit sector as an expression of their dissatisfaction with the current governor (Backer and Carroll 2001). International development support often comes through the international organizations cooperating with the functioning nonprofit sector on the ground rather than government-to-government transfers. The dictatorial government usually demands from donors to channel their funding through the governmental structures, and if done otherwise, to bear the consequences (Heurlin 2010). A good example is when a chair of a human rights center – an organization that provides free legal services for those mistreated by a personalist regime – is put in prison after being arrested under charges of tax evasion of foreign funds through this nongovernmental organization.

*Single-party* regimes differ greatly from the personalist regimes from the perspective of the government relations with the nonprofit sector (Bohmelt 2013). In countries ruled by a single party, social services are often delegated to the nonprofits. Often the welfare is provided by the authoritarian state, and therefore, there is no need for the detached independent nonprofit sector. The regime is stable, and therefore, it has enough time and other resources to establish collaborative or co-optional relationship (Heurlin 2010). Scholars suggest that the nonprofit organizations either function almost freely as to initiate projects and receive international aid, for example, despite the strong clans' culture (Cook 2015), or limited to be governmental contractors. Contracting the nonprofit sector is interesting for the government, because of cheaper labor achieved through the involvement of volunteers and also by the possible greater devotion to the cause, because the staff in such organizations is working foremost for the society's sake rather than for a government. Instead of being treated as an opposition like in the case of personalist regimes, a nonprofit organization is a tool in the war of the elites. Both the ruling class and their opponents try to get as much nonprofits on their side as possible to have a greater popular support.

The system allows for the nonprofit sector, while still pursuing strong coercive isomorphic pressures generated by the central legislation, and, therefore, the nonprofit organizations become alike. Literature has examples, where the creation of any other knowledge outside of the government challenges the legitimacy of the party, and as the result, the legal framework dominates the relations between the local governments and the nonprofit sector (Hasmath and Hsu 2014). It prevents the full-scale cooperation on the ground and transforms any relationship till it corresponds to the central regulations. For a nonprofit, the only way to exist is to be co-opted by the government. Therefore, to gain the trust of the government and greater possibilities to cooperate with the local authorities, the nonprofits build their names by delivering excellent quality of work that corresponds the central government requests to become a successful model.

*Colonial regimes* similar to other authoritarian administrations are primarily interested in maintaining domination, which intervenes with the development of free associations and prescribes the parameters for the inclusion or exclusion of nonprofit organizations in welfare provision. While keeping social spending low, authoritarian power of a colonial regime tries to avoid alternative bottom-up initiatives and limits grassroots movements and empowering. Community building is reserved to a top-down approach, as the bottom-up initiatives of the local population might challenge the authority. A top-down style allows to align forces in support of the state, making it harder for pressure grassroots groups to mobilize. For instance, despite stressing nonintervention in the social institutions and cultural practices of the native populations, colonialism often practices selective intervention in institutional forms strengthening the power relations.

The colonizers prioritize control over development. For example, during the establishment of a colonial rule, the authorities will restrict civil associations and assemblies. In addition to the fear of losing the power, the colonialists feel that providing welfare will attract the outside poor into their power centers usually located in larger cities and, thus, try to avoid it. As a result, local populations have to rely on unregistered groups of community self-help usually located on the peripheries of the cities or completely outside of them (Lee 2005).

*Military regimes* have either no relations with the nonprofit sector or they resemble the ones found in the personalist regimes, especially, in relations to the human rights groups, which are strictly outlawed. In turn, a*uthoritarian monarchies* resemble a lot the stable single-party regimes. In these more stable monarchies, some welfare is provided by the authoritarian state, which decreases the need for the independent nonprofit sector (Bohmelt 2013).

## Challenges for International Support

Even in democracies, states powerfully shape the patterns of the emergence, activity, and survival of the nonprofit organizations, as they do with other non-state actors. In the authoritarian regimes, the situation is exacerbated even more. The main question remains: how to support the independent nonprofit sector in an authoritarian state? A less harmful way is to wait, because as history has shown, the dictatorial regimes come and go. If being idle is not a solution, it is also possible to cooperate with the government. However, direct contract with the government could raise a public controversy. Direct contact of international organizations with the government legitimizes what is in many ways an illegitimate government. Certain organizations avoid it, for others there is no second option, and they fall under the definition of a government-organized nongovernmental organization (GONGO).

Close relations with the authoritarian government raise the question of population loyalty to the nonprofit organizations. For them, international funding either directly supports the authoritarian government or makes it legitimate in the eyes of the international community. For instance, the researchers show that the trust in the nonprofit sector could become very low, mainly due to the image spoiled by the international donors sponsoring briefcase organizations. They function with the permission of the government and are set up only to obtain money from donors with no real programs on the ground (Dupuyabc et al. 2015). Meanwhile, in authoritarian regimes, the self-helped groups sponsored by the members are valued highly by the population and enjoy its confidence (Lee 2005).

The relationship is determined not only by the strength of the regime but also by the institutional environment created by the leadership of the state. For example, the state administration could move from the overt coercion to intelligent sanctioning, when the government creates a defined space in which the nonprofit sector operates.

From the international perspective, the failure of a government to respect human rights creates a misleading impression that local nonprofit organizations are also inefficient. This divergence could be explained by the different objective that the local organizations and the international donors might pursue (Backer and Carroll 2001). Organizations on the ground prefer to maintain a high level of independence from each other, while donors rather encourage collaboration. Duplication of efforts within the limited resources raises the donors' concern, because from their point of view, when organizations are fragmented, the political improvements are slow.

The practice shows that playing against the government creates more pressure on the organizations up to their complete elimination. As a protection mechanism against the government hostility, for example, to avoid a punishment of all organizations in the network, the international assistance is sent only to a single organization. However, if discovered by the government, the foreign intervention blocks the desired growth of civil society (Backer and Carroll 2001). For these reasons, the most popular and safer approach that has been gaining its strength in the 2000s and 2010s is the emphases on citizen education and empowerment rather than institutional change and policy reform.

## Conclusion

Even though the presence of authoritarianism is ubiquitous across the globe, whether a country could be considered a dictatorship is the matter of definition. The fact remains that despite of seemly unfavorable political climate, various nonprofits manage to survive in highly centralized regimes. So, do the various forms of the relationships the government establishes with the nonprofit sector: from being unaware of the nonprofits existence to its attempts to collaborate, co-opt, or even eliminate some nonprofits that become strong opponents of the regime.

The relationships between the public and the nonprofit sectors will differ depending on the type of the government. In personalist dictatorships and military and colonial regimes, the leaders are either not paying attention to the nonprofit sector or tend to completely eliminate it. Meanwhile, single-party systems and long-established monarchies find it more useful to cooperate or to co-opt the nonprofits in their welfare systems.

The threats for the vibrant and organized community come from everywhere. Various groups both within and also from outside of the government abuse the nonprofit sector in the dictatorships. For instance, if funded from abroad, to preserve themselves, the nonprofits might behave contrary to the goals of a positive political dialogue and progressive reform. One thing is for sure, the creation of the vibrant civil society and the embellishment of the beneficial relationships built on the civil dialogue between the public and nonprofit sectors takes time and requires the change of the public values.

Faculty of Law, Meijo University,
Tempaku-ku, Nagoya, Japan

## Synonyms

Comparative legislature; Lawmaking process; Legislature; New institutionalism; Policy process

## Definition

This article describes Japan's lawmaking process, institutional features of the Diet, academic debates over the function of the Diet, and recent changes and reforms of the Diet.

## Introduction

This article reviews Japan's Diet and the legislative process from comparative and institutional perspectives. This article consists of four parts. First, it describes the first half of the legislative process, the bill-making process in the bureaucracy. Coordination inside the bureaucracy and with ruling party members matters in this stage. There are several instruments for facilitating coordination. Advisory Councils (*Shingikai*), legal examination by Cabinet Legislation Bureau (*Naikaku Houseikyoku*), and review session in the ruling party (so-called *jizen shinsa*), all of which are highly specific to Japan.

The second part is about the latter part of the process. After a bill is introduced, in contrast with the first stage, almost all ruling party Members and bureaucrats are cooperative to let the bill pass quickly. It is the opposition parties that tries to amend or kill a bill or to pursue a partisan debate to the public. Therefore, the government and ruling parties rely on informal negotiations between ruling and opposition parties. The so-called *kokutai seiji*, meaning politics by party Members in charge of Diet affairs, characterizes Japan's legislative process.

Third, there are several competing explanations to understand the overall function of the Diet, focusing on the institutional features unique to Japan. Contrary to the conventional view that the Diet merely realizes preferences of the bureaucracy, many scientific studies argue that the Diet works well in different ways. Then it is useful to summarize the debate. The real debate about the Diet is, however, based on the assumption that the Diet does not work well. Then a series of reforms occurred about the Diet and the legislative process in the 1990s, which will also be reviewed here.

This article ends with summary and short descriptions about several topics: bicameralism, bills submitted by Members (*giin rippou*), and budgetary process.

## Bill-Making Process in the Bureaucracy

As is the same as other parliamentary systems, there are two types of bills: government bills (*naikaku teishutsu houan* or *kakuhou*) and bills submitted by Members (*giin rippou*). This article mainly deals with government bills because they consist of most of the bills dealt with in the Diet.

Figure 1 is a flowchart that gives us an overview of the lawmaking process. Bills are born at the bottom of one or a few ministries, elaborated from the bottom to the top of the ministry, coordinated with other ministries in some cases, and finally be submitted to the Diet after the formal approval at the Cabinet Meeting.

The most important thing is, again, Japan adopts a parliamentary system. Thus, bills should almost perfectly be elaborated before submitted to the Diet. Several institutional features strengthen this tendency. First, it is the Cabinet not a vague "government" that has the responsibility to submit a bill. According to Article 5 of the Cabinet Law, Prime Minister, representing the Cabinet, shall submit a bill, budget, and other proposals. Second, Japan's policy process has been characterized as so-called the Iron Triangles, representing special interests shared by bureaucracy, politicians, and interest groups. Japan's bureaucracy has a strong tendency toward sectionalism. In addition, Japan's main political parties, especially Liberal Democratic Party (LDP), are categorized as a catchall party. Politicians represent various interests that sometimes conflict each other. Third, as discussed in the next section, time is extremely scarce in Japan's Diet. So the government and ruling parties have a strong incentive to complete the internal coordination before they submit a bill.

Several informal rules have evolved reflecting the importance and difficulty of internal coordination before the Diet. The first instrument lies

**Diet and the Legislative Process, Japan, Fig. 1** Lawmaking process of the government bill (Source: Nakajima 2014: p.33 (translated by the author))

inside the bureaucracy. Each ministry has several advisory bodies. There used to be more than 200 statutory established councils (called *shingikai*), whose number is now reduced to about 130. Members of a council typically include interest groups (both business and labor), scholars, journalists, other experts, etc. Councils can deal with virtually all topics related to their jurisdiction. There is a controversy whether councils function. Elitist theory criticizes that councils simply follow, or even authorize, preferences of bureaucrats. This argument is based on the fact that bureaucrats select council members at their own discretion and that radical opinions are seldom reflected. By contrast, Pluralists regard the council system as one of the channels to incorporate interest group's preference and expert knowledge with government bills.

A ministry is also able to organize non-statutory, private advisory bodies (*shiteki shimon kikan*). They are typically named Roundtable Conference (*Kondankai*), Study Group (*Kenkyukai* or *Chosakai*), or else. The Prime Minister sometimes relies on these groups. This is especially the case when the Prime Minister begins something that is hard to gain support from bureaucrats and/or ruling party Members. A typical example is the decision-making style by Prime Minister Nakasone Yasuhiro (1982–1987). Nakasone, sometimes called "presidential Prime Minister," fully used private groups on administrative reform, national security, and education reform as if these groups were presidential offices. Although Nakasone had weak political base at the LDP and pursued policies unpopular among LDP Members (especially privatization of the national railway company), he adopted ideas by an advisory body, appealed them to the public, and finally achieved policy successes.

Another informal coordinating mechanism is about the relationship between bureaucrats and ruling parties. This is especially the case with LDP that was born in 1955 and has almost been a ruling party (except August 1993–June 1994 and September 2009–December 2012). The LDP

began the so-called *jizen shinsa* (review-in-advance) system in the early 1960s. All government bills must be unanimously approved by internal organizations such as Policy Affairs Research Council (PARC), General Council, and Diet Affairs Committee. The most important session is Divisions (*Bukai*) under the PARC. Divisions correspond to ministries and Diet Standing Committees. Lawmakers at LDP attend one or more Division meetings at the LDP headquarters usually held in the morning. Bureaucrats also attend the meeting and explain bills they are preparing.

This review-in-advance system has evolved as some LDP lawmakers came to have their own policy specialties since about 1970s. Such Members are called *zoku* (tribe) or *zoku giin* (tribe legislator). For example, a Member who is familiar with public works is *kensetsu zoku* (construction tribe). There are pros and cons about review-in-advance between bureaucrats and *zoku giin*. On one hand, this is one form of representation. *Zoku giin* tend to represent their constituents and interest groups. This system also facilitates coordination when bureaucrats conflict across ministries over a policy issue. However, critics became the majority since 1980s. These decision-making styles turned to be regarded as a hotbed of the Iron Triangle. Politicians mainly care about their reelection. They had a strong incentive to participate in the review-in-advance for two reasons. First, Japan's major parties, except Communist Party and *Komeito*, have very weak party organization. Members of these parties have to win the election largely by themselves. Second, the past electoral system enhanced this tendency. The SNTV (single nontransferable vote) system enforced LDP Members to compete each other and then gave them incentives to appeal to special interests in their constituency. Therefore, what lawmakers pursued was credit claiming, pork barrel, and ignorance of the budget constraint and national-level affairs.

Critics toward the Iron Triangle led to the electoral reform of the Lower House in 1994 which abandoned the SNTV and introduced the current Parallel System of Single Member District and Proportional Representation. Nevertheless, although its influence might be weaker, this review-in-advance system survives after the electoral reform. The Democratic Party of Japan (DPJ) originally had a similar policy research system. Although the DPJ government tried to abandon this system just after they took the government in 2009, this attempt failed. Another recent change is that Japan began experiencing coalitional government since 1990s. Coordination among coalition parties matters now. The decision-making style among coalitions varies. In the case of the longest LDP-*Komeito* coalition, bills are usually discussed at the meeting by Chairs of policy councils after each party completes their internal procedure. In the case of some important bills, ruling parties organize a task force from the beginning.

Parallel with these procedures, bills are subject to review from the legal perspective. A Cabinet agency called Cabinet Legislation Bureau (*Naikaku Houseikyoku*) reviews all bills, Cabinet Orders, and treaties before they are submitted to the Cabinet Meeting. The Bureau checks the following things, all of which are about legal and technical points: necessity of creating a new law, contradiction with Constitution and existent laws, rooms of unintended interpretations, or even the use of words, technical terms, and even punctuation. All government bills become extremely flawless because the review is very strict. This is one main reason that the Supreme Court has seldom made a judgment that a law is unconstitutional. At the same time, critics claim that the Bureau behaves as if it were a court and then it might violate the authority of legislative and judicial branch. The Bureau is also consulted by Prime Minister, Cabinet members, or Diet over legal issues. The answer from the Bureau represents the government. There has been a controversy whether the interpretation of the law by the Bureau touches the political decision, especially about Article 9 of the Constitution abandoning war and armed forces.

After a series of these formal and informal procedures, a bill finally arrives at the Cabinet Meeting. Cabinet members usually meet in the morning of Tuesdays and Fridays. The decision

must be unanimous so as to consistent with Article 65 of the Constitution that "Executive power shall be vested in the Cabinet." Then informal coordination before the Cabinet Meeting matters. There used to be Conference of Administrative Vice Ministers usually held the day before the Cabinet Meeting. Administrative Vice Ministers (*Jimu Jikan*), top of the bureaucrat in each ministry, met in this Conference and made the final coordination mainly about interministerial matters. The DPJ government abandoned the Conference in 2009. But after the Eastern Japan Earthquake in 2011 and the recovery of the LDP in 2012, meeting by Administrative Vice Ministers revived although it is now held after the Cabinet Meeting and not for the coordination of a bill.

## Legislative Process in the Diet

Article 41 of the Constitution states that "The Diet shall be the highest organ of state power, and shall be the sole law-making organ of the State." The standard interpretation of the word "highest" is merely nominal. Other articles of the Constitution also stipulate the separation of powers among legislative, administrative, and judicial branches. In terms of the legislative-administrative relationship, Japan adopts the parliamentary system. The Diet designates and can also make a nonconfidence resolution to the Prime Minister. Instead, the Prime Minister has an authority to dissolve the Lower House.

Figure 2 displays the structure of Japan's National Diet. The Diet has two chambers: House of Representatives (Lower House: *Shugiin*) and House of the Councilors (Upper House: *Sangiin*). Both chambers have Plenary Session (*Honkaigi*), standing and other committees, and other internal organizations. Also, the Diet has the National Diet Library, the biggest library in Japan followed by the US Library of Congress. Figure 2 also describes the membership of both Houses. The main difference between them is the possibility of the dissolution. Whenever the Prime Minister considers it necessary, he/she can declare dissolution within 4 years of the term; Members of the Lower House lost their job and then the General Election should be taken place.

From the comparative perspective, main institutional features about Japan's parliamentary system are as follows. To summarize, there are a lot of hurdles for the government and ruling parties to pass their agendas quickly and smoothly.

First, Japan pursues strong bicameralism. All bills and budget proposals must be passed by both chambers. The Lower House usually deals with a bill first (about 90%) although there is no formal rule about the order. Of course, the Constitution and the Diet Law give the Lower House some privileges: electing the Prime Minister, procedures and rules about annual budget, treaty ratification, making a nonconfidence resolution against the Cabinet, and so on. At the same time, Japan's the second chamber in Upper House has a strong veto power compared to other parliamentary democracies. If the Upper House is against a bill, the Lower House cannot pass it without overriding by two-thirds of the majority. This often happens when the ruling parties lose the majority of the Upper House (*nejire kokkai*, meaning twisted parliament). Also, two-thirds of the majority is necessary at both Houses to call on a national referendum for amendments of the Constitution (which has never happened under the current Constitution). Finally, the Upper House is supposed to have an Emergency Session when the Lower House is dissolved and the General Election is going on.

Second, Japan's parliamentary system adopts the strong committee system like that in the US Congress. The committee system is based on the Diet Law that reflects the idea by the US occupation force. Standing committees are organized based on policy areas corresponding to ministries. All bills are referred to committees just after the Plenary introduced them. Institutionally, it is the Speaker (Lower House) and the President (Upper House) who makes committee assignment with a constraint that committee seats should be allocated in proportion to each party's seat share. In reality, at the same time, each party decides the committee assignment within the constraint of the seat allocation. Ruling parties give oppositions the chair position for several committees when ruling

**Diet and the Legislative Process, Japan,**
**Fig. 2** Structure of the National Diet (Source: Secretariat of the House of Representatives. 2018: 11)

parties' seat share is thin. In addition, committees are given some autonomy. Committees can continue deliberations when the Diet is not in session and if the House approves. Directors (*Riji*) from ruling and opposition parties decide schedule by a unanimous manner. For these reasons, opposition parties can wield a dilatory strategy at the committee stage.

Third, the Budget Committee is especially important. The main role of this committee is to discuss the annual budget mainly just before the next fiscal year begins (around February and

March). At the same time, this committee can deal with everything related to the budget. Coupled with the fact that Plenary Session is very short, the Budget Committee functions like the Plenary in other parliaments: sessions are often televised; ministers, including the Prime Minister, attend the session when necessary and answer the questions from committee Members; and even scandals by politicians or bureaucrats are discussed.

Fourth, unlike other parliamentary systems, the Cabinet has no authority in dealing with the legislative procedure. In addition, there is a custom that the Speaker and the Vice Speaker in the Lower House and the President and the Vice President in the Upper House leave their party affiliations when they get elected. Once a bill is introduced, therefore, the Cabinet completely has to rely on ruling party Members. It is the Rules and Administration Committee (*Giun*: *Giin Unei Iinkai*) that handles legislative calendar. In addition, the Committee makes a decision based on the unanimous agreement by Directors from both government and opposition parties. Then the fate of a bill largely depends on the will and the negotiation skill of the ruling party.

Fifth, the Plenary Session still matters although it is less important than other countries' legislatures. The Diet session begins with the Opening Ceremony in the presence of the Emperor. Just after that, a series of addresses are delivered by the Prime Minister, Ministers of Foreign Affairs, Finance, the State on economic and fiscal policy, and other ministers (when necessary), and then partisan debate proceeds. Next, if the Committee on Rules and Administration decides it necessary, the Plenary holds a Question-and-Answer Session. The Members or the minister who submitted the bill should explain the purpose of the bill and then answer the questions. The most important role of the Plenary is, of course, to make a final decision about a bill, resolutions, etc. A bill arrives at the Plenary Session after a Committee approves it. Then a series of partisan debates begins over controversial bills. Oppositions even wield a dilatory strategy on the floor (sometimes that resorts to physical actions) if they really do not want to let a bill pass. Members' voting behavior is generally party line. But there are a few but historical case that ruling party Members vote against the government bill and then the bill is dead (e.g., postal reform in 2005, increasing the consumption tax rate in 2012). Because such cases politically mean nonconfidence to the Cabinet, that result leads serious consequences such as division of the ruling party, resignation of the Prime Minister, or dissolution of the Lower House.

Finally and most importantly, the legislative session is extremely short. Aside from the Special Session (*Tokubetsu Kokkai*) which is only for electing the Prime Minister, there are two more types of sessions that deal with a bill. The longer one is the Ordinary Session (*Tsujo Kokkai*) which begins in January and mainly discusses the annual budget. But its length is only 150 days, with only one opportunity of extension. An Extraordinary Session (*Rinji Kokai*) is usually called in the fall, but it is much shorter than the Ordinary Session because the next Ordinary Session is supposed to begin in the next January.

In order to reconcile with these tight rules, informal procedures and customs have been developed. Such customs evolved especially when the Rules and Administration Committee experienced gridlock frequently in the 1970s. Parties began negotiations between Chairs of Diet Affairs Committee (*Kokkai Taisaku Iincho*) within each party organization (note: this committee is not a formal organization in the Diet). This is called *kokutai seiji*, meaning politics by Diet Affairs Committee. This decision-making style reached its peak in the latter of the 1955 System. Although the ruling LDP and the main opposition SDPJ (Social Democratic Party of Japan) officially fought over national security and other ideological issues, their Chairs and related Members met frequently both inside and outside the Diet (often first-class Japanese restaurant). Even there is a rumor about the transaction of money or something from LDP to the Socialist. This custom has cultivated personal networks or even friendship between parties, which is said to be a driving force of forming the coalition government between LDP and the Socialist in 1994.

It is true that *kokutai seiji* facilitates the coordination between parties and then improves the

productivity of the Diet. These informal negotiations benefit not only to the ruling parties but also to the oppositions. They can win an amendment to a bill, easily stop an unfavorable bill, let ruling parties pass their bill, and credit claiming to their supporters through these achievements. Nowadays, however, critics toward *kokutai seiji* have become dominant. This decision-making style lacks transparency, which violates accountability to voters, allows inappropriate use of money and, therefore, integrity of the Diet. Although *kokutai seiji* remains as a custom, its importance is significantly weakening. Especially the DPJ government (2009–2012) strongly disliked this type of negotiation. The relationship between ruling and opposition parties is becoming more contentious at the Diet session, which has both positive and negative aspects as well.

## Controversy About the Function of the Diet

Academics have been debating about how these formal and informal rules are functioning. The conventional wisdom criticizes that the Diet merely works as a "rubber stamp" (Baerwald 1974). That is, the Diet easily passes what the bureaucracy prepares without satisfactory discussions and/or amendments. Evidences that support this argument are that bills submitted by Members record very low rate of both submission and passage; the Diet seldom approves an amendment of a bill; bureaucrats, not ministers, tend to answer the questions from legislators; and the length of the discussion at the Diet is very short. This view is a corollary of the Elitist or bureaucracy-centered understanding about postwar Japan. This view, however, has weak both theoretical and empirical grounds and currently almost no political scientists follow. The Diet do have *some* function, but *what*?

The first alternative view toward the rubber stamp theory is called "viscosity theory." Mochizuki (1982), the very famous PhD. Dissertation, argues that the Diet has a strong "viscosity" that prohibit laws to pass smoothly. The extremely short legislative session, strong bicameralism, strong committee system, and unanimous customs about procedure, all of which enable opposition parties to pursue an effective dilatory strategy and then often win a concession (e.g., amendment of a bill) from the ruling parties. This theory is coupled with Pluralistic understanding about Japanese politics. Pluralists regard the coordination process before the bill submission as the "obstacles" for the government. The reason that these obstacles were created comes from the viscosity of the Diet. Because time is very scarce at the Diet session, the government does not want to waste time and then tries to solve all internal conflicts before the bill submission.

The second wave of new arguments about the function of the Diet occurred in the early 2000s under the strong influence of Rational Choice Institutionalism. First, unlike the rubber stamp theory that considers bureaucrats and ruling parties as a unitary actor, new studies rely on the principal-agent framework. The question here is whether ruling parties (and its Members) as a principal are able to control bureaucrats as an agent. The answer is yes: ruling parties have an implicit influence to bureaucrats that let them write a bill that reflects ruling parties' preference from the beginning, unanimous procedural rules are just a custom that ruling parties can easily break, and ruling parties dominate the agenda power that enable them both to pursue the passage of a bill they really prefer and to let oppositions stop a bill that they simply compromised with bureaucrats. Second, whereas all of the studies above regard the Diet as a law-making body, new studies focus on the debate itself. It is reasonable when we recall the argument by Polsby (1975) that a legislature at the parliamentary system is generally an "arena" that ruling and oppositions openly debate. This view considers debates at the Diet as an extension of the electoral campaign that parties and politicians pursue "credit claiming" and "position taking" to voters. Empirical studies about the Diet speeches are now increasing with the technological progress of computer content analyses.

Contrary to the academic debate in political science, however, reforms over the Diet and the legislative process were based on the notion that the performance of the Diet needed to be improved. Politicians proposed a series of reforms and some of them were realized. But the goal of the reform somewhat contradicts each other. On

one hand, someone pursued improving each Members' ability to participate in the lawmaking process, which regards US legislators as the role model. Efforts to loosen party discipline let Members submit and pass more bills and provide one more secretary to assist Members for policies and legislative activities, all of which was only partly successful. On the other hand, Japan experienced a series of reforms in 1990s which aimed at strengthening the power of the parties, party leaders, and the Prime Minister. These Westminster-style reforms include electoral reform, administrative reform, and another part of the Diet Reform in 1999.

There are three notable reforms pursuing the Westminster parliament. First, there used be Parliamentary Vice Ministers (*Seimu Jikan*) selected from relatively junior ruling Members, but their performance was low. The reform abandoned these Vice Ministers and instead introduced the Senior Vice Ministers (*Fuku Daijin*) and Parliamentary Secretaries (*Daijin Seimukan*) customly selected from ruling parties. Second, high-ranked bureaucrats called Government Committee Member (*Seifu Iin*) often answered the questions at the Diet. The new system basically precludes these bureaucrats and instead lets Senior Vice Ministers and Parliamentary Secretaries speak. And finally, debates at Japan's Diet were virtually limited to questions from Members and answers by the government. Then the reform established the new committee named National Basic Policy Committee which serves as the similar role as the Question Time at the British Parliament. This committee is occasionally held at Wednesday afternoon, and then the Prime Minister and opposition leaders hold a highly partisan debate.

## Conclusion

Although there still be a folklore that the Diet is inactive, this article has been describing how Japan's Diet and related legislative processes are the core of the Japanese politics. In addition, the Diet is becoming more important both substantially and academically as the 1955 System ended. At the same time, some politicians and scholars claim that there is still some room of improvements and reforms. Therefore, the Diet may be the subject of change as well as the main political battlefield.

This article ends by quickly pointing out three more topics. First, debates about bicameralism are becoming contentious both empirically and normatively. The Upper House has been criticized as a "carbon copy" that simply traces the same decision as the Lower House. But things are changing as *nejire kokkai* happened three times, the Upper House has not experienced major reforms, and the amendment of the Constitution is now on agenda. How does the Upper House really function now? Should the Upper House be reformed? If so, what should be the fundamental role of the Upper House? Second, normative critics that the Diet should function more became salient in 1990s, but reform ideas might conflict each other. On one hand, someone claim that Members' bills should be submitted and passed more, which is based on the notion that Diet Members should literally legislate like Members and Committees in the US Congress. But that could violate the British-style parliamentary system which is based on strong party discipline and contention between government-ruling party and the opposition. Third, although this article has limited the argument to the lawmaking process, the budgetary process has its own mechanism. Administrative reforms in the 1990s also change the budgetary process. As a part of the 2001 Central Government Reform, Council on Economic and Fiscal Policy was created in the Cabinet Office. Prime Minister, ministers dealing with the economy, and others meet at the council and discuss economic matters. The LDP Prime Ministers let the council decide the basic principle of the budget before each ministry begins next fiscal year's budgeting. This decision-making style shifted the initiative of budgeting from bureaucracy (Ministry of Finance) to the Cabinet. Examining the budget and the budgetary process should serve as a touchstone to test whether the Prime Minister and the Cabinet became stronger after reforms in the 1990s.

Charitable organizations; Charities; Membership associations; Nonassociational nonprofits; Nonprofit associations; Philanthropic organizations versus associations; Social agencies; Sodalities; Tax-exempt organizations; Volags; Voluntary agencies

## Definition

A *nonprofit agency* is a kind of nonprofit organization (NPO) that provides some benefit(s) for nonmembers, usually operating mainly with paid staff. Such agencies usually have a board of directors who make policy decisions. Many documents on nonprofit agencies use the latter term as the same as the broader term *Nonprofit Organizations* (NPOs), which is incorrect.

*Foundations* are a major subtype of nonprofit agency that usually has a substantial endowment as financial assets, a special tax status, and regularly makes philanthropic grants to other nonprofits, usually charities.

An *association* (or *voluntary association*, *membership association*) is a formal or semiformal nonprofit group that mainly has volunteer members and leaders and that primarily seeks member benefits, even though some also seek some nonmember benefits.

Associations distinctively use the *associational form of organization*, which involves having official members who are mostly or all volunteers, some elected formal leaders, sometimes a board of directors with policy control, financial support mainly from annual dues payments or member donations, often one or more committees, and regular in-person meetings attended by official members and informal participants.

Local associations are termed *Grassroots Associations*, or *GAs*, as distinct from *supralocal associations* at state, province, national, or international levels.

The content of this chapter deals with *voluntaristic*s, which is a new, single-word name for the general study of the nonprofit sector and voluntary action, including NPOs of all kinds.

## Introduction

There are three main types or structural forms of nonprofit organizations (NPOs) – *voluntary*

*associations* (more briefly termed *associations* here), *nonprofit agencies* (also termed *voluntary agencies*, or *volags*), and *foundations*, which are in fact a special type of nonprofit agency. This chapter discusses how nonprofit agencies and associations differ from each other and manifest distinctive ways of operating. One key difference between the two major NPO subtypes is that associations serve mainly members, while nonprofit agencies serve mainly nonmembers or the general public. A second key difference is that associations mainly and usually *only* have volunteers as members and as leaders or staff, while nonprofit agencies nearly always have paid staff as executives, managers, or leaders. By definition, agencies never have official members, but may have subordinate volunteers as unpaid workers in a service volunteer program.

A third key difference is in the power structure that the NPO usually manifests: Associations are fundamentally democratic in most nations that do not have dictatorial regimes, while nonprofit agencies are fundamentally hierarchical and in a sense authoritarian anywhere. Put another way, associations mainly operate with bottom-up power structures with the membership having ultimate power, while agencies mainly operate with top-down power structures, usually lodging all policy control in a board of directors or equivalent.

In associations, the official members elect the leaders by voting annually or at some multiple of years, such as every 2, 3, or 4 years. These leaders are usually the principal officers of the association, such as the President, Vice-President(s), Secretary, and Treasurer. Most of the smaller, all-volunteer associations lack a Board of Directors as a policy-making body, but when a Board exists, its members are usually also elected regularly by the membership. In the absence of a Board, the top officer or officers of an association make policy decisions.

By contrast, nonprofit agencies are run like corporations or government agencies, nearly always having a Board of Directors, or the equivalent Board of Trustees, at the top, which has ultimate control of the NPO. Often, the board members are self-perpetuating as a group, with the initial, founding board and its successors nominating and appointing or electing new board members, often the same people or their friends over time, as a dominant oligarchy. The agency paid staff rarely has an effective influence, and usually has no vote, on who the board members are. If there is a volunteer department, often termed a *volunteer service program* (abbreviated as *VSP)*, its administrator, let alone its volunteers, have little or no influence on who becomes a board member. Relatively enlightened boards in larger agencies and in more modern or post-modern nations may try to get some representation of various stakeholders on the board, including paid staff or volunteers, but this is clearly a minority approach to such boards (Guo and Musso 2007).

Many other differences between nonprofit agencies and associations flow from these key differences in the power structure (Mason 1984). Indeed, these two distinctive types of NPOs really constitute two different *subsectors* of the nonprofit sector, or simply two different nonprofit *sectors* of society, given their markedly different operational styles. Both types of NPOs may receive tax-exemptions in many nations and both may in some ways serve the general welfare or public interest, but in many features the similarities end there. The rest of this chapter will describe and discuss the many differences that have been identified by empirical research on these two types of NPOs.

## Different Current Prevalence and Numbers

While there is limited research on associations or agencies in various contemporary nations, there are multinational projects that provide some rough indication of agency prevalence (e.g., Salamon et al. 2004). Seven NPOs per thousand of population is a reasonable global estimate, with a margin of error of perhaps 50% around this estimate (Smith 2014). With a global population estimate of 7 billion earlier in this decade, that yields an estimate of about 56 million NPOs circa 2010–2013, with 49 million of those being associations, mostly local associations or GAs. The remaining seven million of NPOs are mainly nonprofit agencies, but also include a small

percentage of paid-staff-based larger associations, especially national and international associations.

The numbers of associations worldwide are growing significantly; two studies of 90–140 of the major nations of the world have identified the major determinants of association prevalence and the sheer frequency of associations (Schofer and Longhofer 2011; Smith and Shen 2002). Confirming each other generally, these independent studies show that greater prevalence of associations in contemporary nations results in large part from larger population size, greater average formal education, greater GDP per capita, more civil liberties and democracy, longer experience historically with democracy, more government expenditures per capita, and less civil unrest and disorders as predictors. Given a global historical trend toward increasing industrialization and modernization, increasing educational levels, and other factors favoring more associational prevalence, the global growth trend of associational prevalence for the past 150 years is likely to continue (Boulding 1953; Harris et al. 2016).

Although associations are roughly eight times more frequent than agencies among NPOs globally, nonprofit agencies, on average, are wealthier in terms of assets and annual income. Because associations are usually all-volunteer, especially GAs, this is not a surprise. Paying staff salaries in agencies requires much more substantial funding, which partly explains why associations are globally more frequent than agencies and have been for 10 millennia. Agencies are far more likely to own or rent an office or building as their headquarters and base of operations, in part because paid staff need such a semipermanent daily base.

## Different Typologies of Groups

The typologies used by researchers to study and understand NPOs are quite different for associations and agencies. There are various typologies of associations in terms of major goals or activities pursued, but there is a general consistency in such *purposiv*e types. About ten such goal types are frequently used, including religious, philanthropic, political influence, economic-occupational, self-help, and sports-recreational. Those ten types, plus an *Other* category, successfully classify all of the major purpose-activity types of associations used in several major studies done in many nations.

There are also *analytical* types that are far more relevant and significant for studying and understanding associations. They allow more theoretical and causal conclusions to be drawn about the nature and operation of different associations, as contrasted with agencies. One handbook lists 55 such structure-process analytical typologies, which help predict and explain association behavior and impacts.

The eight most important ones for understanding associations are the following, according to the author:

1. Structural type of members: individual persons vs. organizations vs. both.
2. Conventional-mainstream-acceptable vs. unconventional-outsider-marginal-deviant in goals or means to achieve them.
3. Sociocultural change seeking vs. integrative-establishment-*status quo*-oriented.
4. Internal, member-focused goals vs. external, nonmember-focused goals vs. both.
5. Degree of formalization: high vs. low bureaucratization and centralization.
6. Degree of socio-political power and influence: low vs. high.
7. Polymorphic, as a branch or chapter of some higher-level parent association vs. monomorphic, not structurally linked to some higher level.
8. Instrumental vs. expressive goals or purposes.

Nonprofit agency typologies typically focus only on purpose-activity types. The two typologies most commonly used are the International Classification of Nonprofit Organizations/ICNPO (Salamon and Anheier 1992) and the National Taxonomy of Exempt Entities/NTEE, used by the Internal Revenue Service of the USA. Both have their limitations even as purpose-activity typologies. The NTEE is

US-based, and very long and unwieldy. The ICNPO is more transnational, but not adequate for classifying associations also, as the author has pointed out, with suggested improvements. Both were devised mainly or solely for classifying agencies, not also associations, as if associations did not exist or did not matter as NPOs.

When we turn to analytical classifications of nonprofit agencies, the set of association types listed above are not very useful, principally because most agencies do not vary much on many of the association analytical dimensions. Thus, nonprofit agencies usually have individual persons as staff and volunteers; are conventional-mainstream-acceptable in goals or means to achieve them; are integrative-establishment-*status quo*-oriented; have external, nonmember-focused goals; have high levels of bureaucratization and centralization; are legally incorporated and formally registered with some level of government; have exemption from certain government taxes; have a board of directors; have little rotation of individuals in top leadership positions; have at least three levels of bureaucracy; and have instrumental goals or purposes. Agencies do vary in whether or not they are residential, high or low in sociopolitical power and influence, and polymorphic or monomorphic, but tend usually to be monomorphic – existing only at one site, not branches of some larger parent organization, such as a national or international agency.

## Differences in Governance and Guidance Systems

Based on many key sources (e.g., Cnaan and Milofsky 2008; Powell and Steinberg 2006; Renz et al. 2010; Ruckle 1993; Salamon et al. 2004; Smith 2000), in this and several following sections are listed key differences between associations and nonprofit agencies, emphasizing GAs as the most globally frequent NPOs.

In terms of internal governance and guidance systems, two complementary structure-process features can be distinguished – *ideologies* and *incentives*. NPO ideologies consist of what NPO individual affiliates, such as members, volunteers, board members, or paid staff, are systematically encouraged to believe about the group. NPO incentives consist of structured reward and punishment patterns systematically applied to affiliates. Associations and agencies both tend to be similar in the extent of ideology they use: Their ideology is generally moderately extensive in mainstream NPOs, but much stronger in deviant NPOs, which are usually associations, not agencies.

When it comes to NPO incentives, however, there are marked differences between associations and agencies. Simply put, nonprofit agencies mainly use utilitarian or economic incentives, since they depend mainly on paid staff to accomplish their goals. In marked contrast, such utilitarian incentives are usually of little importance in the majority of associations, with the exception of occupational-economic associations like unions or professional associations. Much more important in associations, especially GAs, usually are sociability and purposive incentives. That is, members and volunteers are rewarded most by sociability benefits, such as friendship, informal relationships, feelings of belonging, and also by the psychic rewards of feeling they are working toward goals they approve of.

Of secondary importance generally, but especially important in certain relevant types of associations, are informational incentives, such as learning new facts or processes or having new and novel experiences, sociopolitical influence and empowerment, developmental incentives such as growing as a person, and service incentives such as helping others, often comembers of the association, but sometimes nonmembers. Sometimes the paid staff of nonprofit *agencies* experience one of more of these association-type incentives, but in agencies these incentives always tend to be quite subordinate to the utilitarian incentives – pay and fringe benefits. Of course, the *volunteers* in a nonprofit agency may experience some or all of the association incentives listed, but likely do so less than do association volunteers.

## Different Internal Structures as Roles and Subgroups

The term *internal structure* of an informal group or organization refers to enduring customs that involve formal roles and subgroups, such as committees, work teams, projects, programs, departments, and divisions. Associations and agencies also differ markedly in their internal structures. Although both types of NPOs are similar in usually having a small locality base of operations and substantial internal autonomy, the fact that associations depend mainly on volunteers, while agencies depend mainly on paid staff to get work done and move toward their goals, makes a huge difference. For instance, paid staff usually have to do what they are told to do, but volunteers, mainly using their leisure time and seeking psychic rewards, have to be treated far more carefully and kindly – or they simply leave or fail to show up. Along this same line of thought, members and volunteers in associations are usually seeking internal or member-benefit goals, while the paid staff of agencies is generally expected to seek nonmember benefits goals – helping outsiders as recipients, the larger community, or the world somehow. Further, associations tend to be much more democratic, so individual members and volunteers tend to feel more empowered and that they can influence operations and even goals.

Agencies are much more hierarchical, and their basic top-down power structure means that paid staff often feel alienated and powerless, usually having little influence on operations and none on goals. In very small agencies, however, with mostly volunteers, the situation is sometimes more like associations. Associations, being leisure activity sites for all volunteers and having few or no paid staff, are nearly always more informally organized and run than are agencies. Agencies are nearly always *work* organizations, not *leisure* groups, hence having paid staff that all have jobs to keep or lose if they fail to follow instructions. As a result, agencies are nearly always more bureaucratic and formally organized than associations, except for very large associations with many paid staff, which are quite rare numerically. As a further result, working in a nonprofit agency is usually far less fun and enjoyable than being an active member or volunteer in an association.

Associations also tend to be more demographically homogeneous in their memberships, while agencies tend to be more heterogeneous in the backgrounds of paid staff. One result is that association members usually feel more satisfied with similar individuals in associations they have freely chosen to join and participate in, than do paid staff in agencies, who often simply may have needed the job.

As suggested earlier, individual associations on average are much poorer in economic resources than are individual agencies – less assets, less annual income, usually no paid staff to do things no one really wants to do, such as janitorial work and cleaning bathrooms, no regular everyday headquarters or office space, little NPO equipment or facilities, and little or no storage space. Agencies on average are much better off in all of these ways. However, to think that, as a result, associations in general are intrinsically weak and unimportant is to commit the money-is-the-key, flat-earth-map fallacy.

As leisure time groups, GAs are rarely incorporated or registered with the government at any level, and similarly seldom have direct tax-exempt status. It is scarcely worth the time, money, and effort of association leaders involved to arrange these formalities. However, in some nations like the United States, polymorphic local branches of larger, state or national associations, may receive these statuses because of their linkage to a parent association. Associations are much more likely to be polymorphic branches in modern societies than monomorphic or solitary, which makes them stronger and more likely to survive on average than solitary, monomorphic associations.

## Different Internal Processes or Procedures

The internal processes of a group or organization are the customary ways of doing things and the timing of these activities, such as usual procedures and timing for working, meetings, interacting, taking work breaks or meals, and the like, when

operating in the context of the group's internal structure. As in other characteristics, associations and agencies also differ markedly in their internal structures, although both types of NPOs have distinctive action norms and customs. But associations, especially GAs, usually operate with very restricted timing, in a sense only active during general meetings and committee or fund-raising events, if any. As leisure time groups, they usually meet weekday evenings or lunchtimes and on the weekend, and tend to have no office and paid staff with regular hours. By contrast, nonprofit agencies usually have an office and at least one paid staff, with weekday 9–5 hours in the USA, for instance. Some nonprofit agencies, like museums, libraries, and colleges or universities, operate on the weekend, and still others operate all the time, such as hospitals and rehabilitation agencies. Thus, nonprofit agencies operate rather continuously, while associations are markedly intermittent in their times of operation.

Associations, especially GAs, tend to do only informal, word-of-mouth recruitment, or use posters and websites to attract members, while nonprofit agencies do much more formal recruitment, through newspaper advertisements, commercial employment agencies, job fairs, and Internet websites. Associations mainly do informal socialization of new members, rarely having special training for new members, while agencies usually do semiformal or formal training of new paid staff. These practices are consistent with the low degree of professionalism, indeed, often proud amateurism, in associations and their leaders as leisure time groups. Nonprofit agencies, as work organizations, by contrast tend to be more professional in all paid staff matters. Larger agencies often recruit professional managers with advanced degrees in nonprofit management or administration. Consistent with informality and low professionalism, members and leaders of associations are rarely terminated involuntarily and ejected from the group. But agencies often fire paid staff, including leaders, for poor performance, conflicts of interest, or absenteeism.

Looking at the environment of NPOs, associations usually receive no external funding as grants from foundations, and in the United States they rarely receive government funds, either as contracts for services or regular operations. Government funding for associations, usually in small amounts, is more common in European nations, and in higher income nations elsewhere. Nonetheless, annual member dues, fund-raising events, and donations by members, by families of members, and by friends are the main sources of funding for most associations. Characteristically, agencies do not have annual dues, but rather get most of their income from fees for services, including entry fees, for instance at private secondary schools, colleges or universities, museums, libraries, and athletic or exercise venues. In Europe, agencies may receive operating grants from government. In the case of nonprofit health agencies, like hospitals and rehabilitation nonprofits, insurance payments are very important sources of funding, as in the USA. Agencies also receive a minority of their funding from philanthropic donations from individuals and grants from foundations. Unlike most associations, agencies these days often also receive government contracts for delivery of services.

Other important aspects of NPO relationships to environments include collaboration with external NPOs, with both associations and agencies tending to do some of this. Associations are more likely to be linked to higher geographical-level parent organizations, like state or province and national associations as polymorphic associations. As noted earlier, they also may be parts of local coalitions of NPOs with common goals or projects. Nonprofit agencies are rarely polymorphic, with links to a state or national parent organization. But larger ones often participate in state or province or national professional associations of similar NPO types, which often get involved in setting standards for organizational members and enforcing these.

## Different Management and Leadership

In addition to prior sections on internal governance, structures, and processes, there is also research on NPO leadership and management. As suggested earlier, boards of directors are far

more common and important in agencies, which nearly always have them, than in associations. Many, perhaps most, local associations as GAs do not even have formal boards of directors. At higher territorial levels, like the state, province, national, or international levels of associations, boards are usually present, often required for government registration purposes. When present, boards tend to be quite powerful in either type of NPO, and board members usually participate as unpaid policy volunteers. Often, boards have term limits, which limit oligarchy to some extent, but such limits are not universally present. Boards in associations, especially in GAs, and also at higher territorial levels, are mainly comprised of association members. By contrast, boards of agencies tend to have a broader range of members, not necessarily people involved in the agency as paid staff or volunteers. Agency service program volunteers are only rarely represented on the agency boards.

Leaders are substantially more important in associations than in agencies. Especially in GAs, loss of a key leader can often lead to the association's demise, while agencies usually have more leadership depth in sheer numbers. When a top agency leader leaves, one of the remaining paid staff is usually eager to step in as a leader to preserve his or her job and perhaps earn more. In associations, leaders are mainly elected and are volunteers, but in agencies they are nearly always appointed and are paid staff. Leaders in associations are more likely to have some charisma than in agencies and are nearly always selected from among existing association members. Some agency leaders are often brought in from outside, not previously involved in the agency, though promotion from within is still the norm. As noted earlier, low professionalism is usual among association leaders, while higher professionalism is common in agencies, especially larger ones. Thus, selectivity of leaders in associations is much lower and less stringent than in agencies, where jobs are at stake. As a result, leader quality problems are usually greater in associations.

Regarding leadership activities, priority setting and planning are usually much stricter, more detailed, and more thoughtful in agencies than in associations. Association leaders tend to show members more consideration and kindness than agency leaders tend to show their employees, as a consequence of markedly different compliance structures, voluntary versus remunerative approaches. Agency leaders tend to show their employees stricter supervision than association leaders show their active volunteer members (Renz et al. 2010; Nesbit et al. 2016). This occurs mainly because associations are leisure time contexts, while agencies are work organizations, with paid jobs at stake and more accountability is demanded in the organization generally.

## Different Impact and Effectiveness

The impact and effectiveness of NPOs are important factors in understanding their respective roles in societies. Associations are notable for having a variety of significant impacts on their members, especially on active members as associational volunteers, influencing greater longevity, health, social relationships, political empowerment, job income levels, and even well-being or happiness. By contrast, agencies have not been shown to have such positive impacts on their employees, although their service program volunteers, if any, often receive some similar benefits to association volunteers, but to a more limited extent.

Evaluating the broader impact of NPOs is very difficult to do well. Both ordinary nonprofit agencies and foundations often perform useful functions where they exist in human societies. However, associations, especially social movement organizations, have the greatest long-term average impact on social progress in human history, sometimes referred to as *ethical evolution*. When the impact of associations on communities and entire societies in human history is reviewed, the conclusion is that associations in general, especially sociopolitical change-oriented associations, usually as components of social movements, have had massively greater impacts than agencies. Such associations, *not* mainly nonprofit agencies or even governments, have been directly

responsible for ending widespread slavery, gaining substantial rights for women and the handicapped, protecting gays and lesbians, and gaining rights for labor unions. Usually the associations with the greatest historical impact have been perceived generally as deviant and stigmatized when they first arose, because socio-cultural change is usually strongly resisted in any society, such as the early anti-slavery or women's rights associations in various nations. Deviant voluntary *associations*, which seek goals that are generally rejected by their surrounding society, though quite rare, are much more frequent than deviant nonprofit *agencies*: It is easier and wiser to be deviant in one's leisure time than when one's job is at stake.

## Conclusion

Because voluntaristics scholars tend to study ***either*** associations ***or*** nonprofit agencies, but only ***rarely both***, research-based comparisons of these two key NPO types are seldom done. The content of this chapter comes mainly from independent studies of either type of NPO, ***not*** from directly comparable studies of samples of both associations and agencies, which have been almost totally neglected. Much prior research demonstrates that nonprofit agencies and associations differ markedly on a wide range of important characteristics. Some examples of such differences are dates of origin in human history, power structures, intended beneficiaries, frequency in nations, wealth and resources, incentive systems, use of volunteers versus paid staff, internal structures and processes, management and leadership, and levels of impact and effectiveness in societies. There is much empirical evidence that the nonprofit or third sector really consists of two very different subsectors, or more accurately two distinct *sectors* of society, the associational and the nonprofit agency sectors.

Most voluntaristics scholars and academics focus on nonprofit agencies in their research, publications, and teaching, perhaps in large part from following the norms of their main academic disciplines and because agencies are more visible, easier to study, and complexly bureaucratic. Any given nonprofit agency is usually wealthier and larger by other criteria than is the average association. But this approach overlooks the cumulative numbers of associations, especially the GAs in any nation, and their collective, long-term historical impact. Nonprofit agencies seem to broadly serve the public interest and social welfare in most nations, but certain associations, especially socio-political change associations as parts of social movements at any territorial level, are the main forces of sociocultural change in most nations in promoting ethical evolution and societal progress. Voluntaristics scholars would do well to seek more balance in their research and theory concerning associations and agencies, instead of frequently ignoring associations without good reason.

|---|---|
| Public procurement | The process of purchasing of goods, services, and works by the governments as well as the enterprises which are owned by the state. |

## Introduction

Public procurement is a highly regulated element of public administration. That is, the way in which governments go about acquiring goods or services from suppliers in the private market for purposes of fulfilling their public functions is typically governed by detailed regulatory regimes. Public entities thus mostly do not have freedom in the methods they use to acquire goods or services. It is common to find that in most countries, the public procurement regulatory regime contains detailed rules on what procedures a public entity should follow under particular circumstances to acquire goods or services.

While it is common to find that public procurement practices are prescribed, often within a fairly strict and detailed set of rules, these practices differ in important respects between different countries. There have been major movements towards international harmonization of public procurement practices for the last 25 years. However, major differences remain between different countries and regions.

## Procurement Methods or Procedures

The way in which a public entity goes about acquiring goods or services is typically referred to as public procurement methods or public procurement procedures (Arrowsmith et al. 2000). These typically take the form of a number of prescribed procedures or steps that the public entity must follow to enter into a contract with a private supplier in terms of which the supplier will provide the required goods or services to the public entity.

The prescripts setting out these methods and the conditions under which particular methods

must be used often constitute the bulk of states' public procurement regulatory regimes. These methods capture all the major stages and steps in a typical procurement cycle. In its most common form, a procurement method starts with the identification of the need or the requirement for goods or services, followed by the drafting of a description of those goods or services, typically called the specifications, the strategy for approaching the supply market, inviting suppliers to offer goods or services in response to the requirement, evaluating the offers received, deciding on the preferred supplier, entering into a contractual relationship with the supplier, managing performance under the contract, and concluding with a review the relationship.

Over time, a number of typical procurement methods have emerged as fairly standard labels or approaches to public procurement. These include open bidding, limited bidding, quotations, and direct procurement. While these are fairly common and could be found in some form in most procurement systems, the details of particular methods can differ quite markedly between different procurement systems, despite the use of similar (or even the same) label.

## International Influences

There have been a number of international influences in public procurement that have generated some levels of harmonization in procurement practices. Globally, the most pertinent instruments are the Model Law on Public Procurement of the United Nations Commission on International Trade Law (UNCITRAL) and the World Trade Organization's (WTO) Government Procurement Agreement (GPA). Both instruments were initially adopted in 1994 and substantially revised versions of both were adopted in 2011.

The UNCITRAL Model Law has generated significant harmonization of procurement practices among countries that have used the model for their own public procurement regimes. It is evident when comparing procurement methods in these countries that there are fairly standard approaches. This is not surprising given the procurement methods constitute the single biggest topic covered by the Model Law. If one thus compares procurement methods in Nigeria with those in Jamaica, for example, which are both countries that based their procurement laws on the Model Law, one finds that the procurement methods are virtually identical, with "national competitive bidding" and "international competitive bidding" as the default methods. The same can be said of many other procurement practices, such as bid securities, record-keeping, and cancellations.

The WTO GPA has not had a similar harmonization effect, largely because of the different nature of the instrument. Unlike the Model Law, the GPA does not provide a statutory model for countries to adopt. Rather, the GPA sets out the principles that countries that are party to the agreement must adhere to in their respective procurement regimes. The focus is thus not on having similar procurement practices, but rather practices that adhere to certain agreed principles (mainly non-discrimination) regardless of their similarity. If one thus compares procurement methods of countries that are members of the GPA, for example, the USA and any EU member state, one finds significant differences in procurement practices.

At regional level, there have also been a number of noteworthy instruments that have generated harmonization of procurement practices. The prime example is the European Union's directives on public procurement. Since 1971, these directives have increasingly prescribed a common code of procurement practices in EU member states (Arrowsmith 2006). Other notable regional instruments include the public procurement regulations and directives of the Common Market for Eastern and Southern Africa (COMESA) and the government procurement directives of the West African Economic and Monetary Union (WAEMU). These instruments have also greatly increased the harmonization of procurement practices among COMESA and WAEMU member states, respectively.

## National Differences

Despite the increasing international harmonization of procurement practices brought about by international and regional procurement instruments, major differences in procurement practices remain. Such differences include distinctive approaches to procurement, distinct procurement methods, and variations in the specific steps to be taken within common procurement methods.

A significant difference in procurement approaches between different states relates to the measure of discretion granted to procurement officials. This is quite a foundational distinction, since the level of discretion granted typically dictates the nature of procurement practices. Some practices only make sense within the context of high levels of discretion, whereas some practices are indeed aimed at curbing discretion. Such differences in levels of discretion can impact on a range of procurement practices. For example, procurement practices in different states in respect of the criteria used to determine whether a particular supplier qualifies to participate in the procurement, sometimes referred to as eligibility or responsibility criteria, may largely differ depending on whether a procurement official is given discretion to determine such criteria and at what level. A procurement official may thus be granted discretion to determine in each procurement what the eligibility criteria should be for that particular procurement. Alternatively, the eligibility criteria may be generally prescribed and procurement officials may have little or no discretion in deciding on the criteria to use in a given instances. Between these extremes, there are a range of different options allowing some measure of discretion subject to conditions or parameters.

The particular procurement methods and the specific format of those methods also largely depend on the measure of discretion granted to procurement officials. So, for example, procurement rules for federal procurement in the United States of America allow procurement officials (contracting officers) to use sealed bidding (more commonly known internationally as open competition or bidding) or competitive negotiations, subject to some conditions. This grants considerable discretion to contracting officers, firstly to decide whether to use sealed bidding or negotiated procedures and if the latter, to engage suppliers in direct negotiations. This highly discretionary method of procurement is now used for the vast bulk of federal procurement in the United States. In stark contrast, many other states strictly prescribe that bidding is the default method of procurement and that procurement officials may only under closely circumscribed circumstances depart from this method and enter into negotiations with suppliers. This is, for example, the approach in most African states as well as under China's procurement rules.

While there is significant congruence between states in the procurement method that is commonly referred to as open competition (or open bidding, open tendering, open/formal tendering), there are also various other procurement methods that are particular to specific states and that introduce notable differences in procurement procedures.

Under the EU directives, for example, a host of different procedures for negotiated procurement have emerged. These include the competitive dialogue procedure, the competitive procedure with negotiation, and the negotiated procedure without prior notification. Especially the competitive dialogue procedure has become a distinctively EU procurement practice for use in complex procurements and represents a mix of the open and restricted procedures and negotiated procedures. However, even within the EU it is of interest to note that not all members states have used this particular procedure for their complex procurements with a country such as Germany continuing to rely on the negotiated procedure (Burgi 2012).

Another notable example of distinct procurement methods is procedures that have been developed to promote innovation by means of public procurement. This use of public procurement, commonly referred to as public procurement of innovation (PPI), has become an important demand-side measure in innovation policy. However, the actual procurement practices employed for this purpose have differed between states. Under the EU directives, a new form of

competitive procedure was introduced in 2014, called innovation partnership, to enable PPI in the EU. This procedure allows for the combination in a single procurement of the acquisition of both the development and supply of innovative goods or services. Another approach is to allow public entities to use direct contracting methods, i.e., procurement without competition, when the aim of the contract is to acquire research and development, a practice found in Colombia, for example. A different practice, found in the Russian Federation and South Korea, is to set targets in the ordinary procurement activities of public entities for the procurement of innovation products, e.g., as a percentage of overall procurement (OECD 2017). Another practice to promote innovation through procurement, also employed in Russia, is to set payment terms in procurement contracts to the achievement of final outcomes rather than outputs such as quantities supplied. Along this route, a supplier is thus rewarded for the innovative outcomes achieved. Linked to this is the practice of formulating specifications in public procurement in functional terms rather than describing the actual goods or services required. This approach allows suppliers to come up with their own solutions to the achievement of the function and thus supports innovation. From these examples, it is evident that while the objective of public procurement for innovation is widely shared between states, the procurement practices to pursue that objective differ significantly between states.

A similar divergence has emerged in relation to practices aimed at achieving sustainable public procurement (SPP). However, this divergence between states is more conceptual than the practical differences found in respect of PPI. SPP can be understood as the integration of environmental, social and economic considerations in public procurement. However, states have diverged in how they have conceptualized sustainability in their public procurement practices. Environmental considerations are typically given primacy in procurement practices in the Global North compared to the Global South, where social considerations are typically favored (Stoffel et al. 2019). While the mechanisms employed in SPP practices are thus often similar between states, e.g., incorporation of sustainability criteria in adjudication or specifications, these mechanisms have focused on different dimensions of sustainability in public procurement practices.

## Conclusion

The differences in procurement practices between states reflect differences in the values or the objectives that inform the respective public procurement systems. Procurement systems can be informed by a range of different values or objectives. These include competition, transparency, integrity, efficiency, customer satisfaction, value for money, risk avoidance, uniformity (Schooner 2002), and a host of policy objectives such as wealth distribution, environmental protection, industrial development, human rights protection, etc. The particular objectives that are dominant in a specific state will have a significant impact on the procurement practices adopted in that state so that a state's procurement practices can be viewed as a reflection of the values of that state's procurement system. For example, in a state where integrity is a dominant objective (e.g., because of concerns regarding high levels of corruption), one is likely to find that procurement practices will be characterized by low levels of discretion and high levels of detailed prescripts circumscribing procurement procedures. Or in a state where efficiency and value for money are overriding objectives, procurement practices are bound to be more flexible and to allow procurement officials more discretion to engage with suppliers to secure the best possible deal.

Despite increasing harmonization of public procurement practices globally due to influential international and regional procurement instruments and international policy agendas such as free trade and sustainable development, important differences in procurement practices remain between states. These differences are largely an expression of the continued divergence of objectives pursued through public procurement systems globally.

# Digital Media in Nonprofit Organizations

F. Elizabeth Gray
Massey University, Wellington, New Zealand

## Synonyms

Charities; Information and communication technologies

## Definition

Digital media includes software, databases, websites, digital video, social media, and digital audio, and it allows for the creation of dense, distributable, replicable, universalized, and manipulable information.

## Introduction

Some forms of digital media, like email and the Internet, promote unidirectional information dissemination, while social media, which includes interactive, collaborative, web-based applications like Facebook, video and photo-sharing sites like YouTube and Instagram, and microblog and info-sharing sites like Twitter, structurally supports feedback loops between an organization and its stakeholders. Databases allow individuals and organizations to store, access, and manipulate massive amounts of information. The advent of digital media has offered nonprofit organizations new communication opportunities, time and cost savings, and vastly expanded reach. However, all digital channels and platforms carry with them challenges and risks, some particular to the mission and imperatives of the nonprofit sector, and the strategic mobilization of digital media deserves sustained organizational attention.

## History and Background

In August 2016, the Brazilian government announced it would not grant the license required to build the São Luiz do Tapajós (SLT), a giant dam planned for one of the last major free-flowing rivers in the Brazilian Amazon. The project, which would have had a massive environmental impact, would also have displaced the Munduruku indigenous people of the region. The Munduruku were joined in their opposition to the project by Greenpeace, which marshaled 1.2 million people internationally to send digital messages protesting the building of the SLT dam and pressuring multinationals to distance themselves from the project. The activation of this

opposition, and its scale, was made possible by Greenpeace's global digital media campaign.

While the nonprofit sector is tremendously diverse – encompassing not just global environmental campaigners like Greenpeace but also regional health and service providers, sporting and recreation bodies, and business and professional associations – at a fundamental level their goals are inherently similar and relational. These goals include educating publics through information dissemination; advocating for group interests, or for policy development or change; soliciting involvement, whether through donations, volunteering activity, or less tangible forms of support; promoting organizational reputation; and interacting in general, ongoing ways with current and potential supporters and donors.

The financial imperative is as foundational to the nonprofit organization's concerns as the relational imperative. Nonprofit organizations (NPOs) are historically and notoriously short of resources. Shoestring budgets impact the activities and projects that may be funded, and also the attraction and retention of staff, which has a corollary impact on activity and campaigning. Following the global financial crisis of 2008, charitable donations at a corporate and individual level shrank dramatically, resulting in NPOs facing tighter budgets and more competition for donors' attention than ever before.

Communication is thus essential to NPOs' relational and financial priorities. In the 1980s and early 1990s, traditional communication methods involved specialists within NPOs reaching out to journalists in efforts to have their messages picked up and disseminated. These regular media targets effectively acted as gatekeepers of NPO messages for wider publics, though direct mail campaigns of various kinds might also be employed. NPO messages tended to be produced via traditional communication divisions within the organizations and also via traditional processes of message production: written copy was provided predominantly for print media, and radio and television dissemination might also be possible for an NPO with a less straitened budget.

Since the early 1990s, digital media has created a variety of new communication avenues, demanding entirely new methods of production. After 1993, when the World Wide Web became free for all to use and develop, the use of email became ubiquitous. Curtis et al. (2010) studied over 400 NPOs and reported that 97.8% of nonprofit PR professionals used email. Facebook, originally developed in 2004 for individuals to connect socially, opened registration to organizations in April 2006. Twitter was launched in October 2006, its microblogging services instantly utilizable to promote organizational values and objectives. Written news releases directed at journalists have diminished. Organizations may now use photos, videos, or 140-character snippets to disseminate their messages. This message dissemination is available via digital means at a fraction of the former cost, although the costs of software and hardware needed to support the new dissemination channels have increased manyfold.

Digital media enables almost instant response to events. In addition, more numerous and more diverse audiences may be exposed to NPO messages via digital media. The Internet reaches more homes globally than any traditional media outlet was able to, and more directly. While digital media has not entirely replaced traditional media outlets, journalists may now follow nonprofits on social media and initiate contact with the NPO, rather than the other way around. And because of the disseminability of digital outputs, messages may be circulated and forwarded by recipients in an ever-broadening network.

Interactivity is a particularly critical component of digital media. The expanding audiences of NPO messages may themselves contribute content, through comment forums, email contact forms, and opportunities to upload original material. Social media also enables organizations to receive real-time feedback about their announcements and to engage in conversations with stakeholders, further increasing their knowledge of their publics and their ability to respond nimbly. Audience expectations have shifted to reflect digital media's ability to convey responses that are swift, personal, and authentic.

In response to the upsurge of digital media and the opportunities it affords, which are discussed in

more detail below, IT has become central to the mission of most NPOs. The new prominence of technology as an enabler and driver of mission has had corollaries for expectations of personnel, and of leadership. Withal, the rise of digital media means that a clear and coordinated communication strategy is more important than ever for the nonprofit sector.

## Opportunities

Key benefits offered by digital media include expanded opportunities to build relationships with stakeholders, to raise an organization's profile and credibility, to frame issues with agility and speed, and to build trust.

Globally, NPOs have recruited digital media in an attempt to achieve organizational goals. First and foremost, digital media presents the opportunity for vast relationship expansion. By the relatively straightforward means of producing and curating an organizational website that may be accessed by anyone in the world with Internet access, an NPO may engage potentially billions of supporters. These audiences may have never encountered the organization's mission via traditional media and may represent demographic diversity never previously captured or even targeted by the organization. The millennial generation, highly engaged and proficient with digital media, is one demographic that represents the potential of a more diverse support base for NPOs.

Digital media enables the strengthening of audiences' identification with a particular organization or cause, through its key characteristic of interactivity. Social media, in particular, offers myriad possibilities for enhancing participatory, two-way communication. Organizations may solicit their audience members' contributions to digital materials, via comments, blog posts, or uploaded photographs or audio and visual content, which in turn connects to those individuals' wider networks. Such interactivity may be enormously valuable for NPOs. Supporters may contribute content, via a Twitter feed or a Facebook page, that appeals to a particular group more effectively than any content generated by the organization's in-house communications team. Further, digital media offers mechanisms to enable supporters themselves to drive advocacy efforts, widely disseminate information, and even self-organize, in efforts that may be completely independent of the NPO. Self-perpetuating, peer-to-peer-driven activism, enabled by digital media, has proven a useful adjunct to NPOs' fundraising efforts. In 2015, MDG Advertising reported 33% of all online donations to NPOs were made through peer-to-peer campaigns (Campbell 2015). Peer-to-peer campaigns may also go viral, gain international attention, and reemerge in different forms. One example is the 2014 global phenomenon of the ALS Association's ice-bucket challenge. To raise awareness of and donations for Amyotrophic Lateral Sclerosis – or motor neurone disease – individuals videoed themselves tipping a bucket of ice water over themselves and then challenged others to do likewise. This campaign also epitomizes the emergence from digital media of entirely new kinds of activity and organizational identity for NPOs. For example, network organizations have emerged that exist primarily in cyberspace, with virtually no infrastructure at all, enabled by the Internet's facilitation of supra-geographic and asynchronous communication. Groups may not be co-located, may have no physical premises, and may have very limited resources, but can campaign effectively using digital media such as websites, listservs, and online chat rooms.

Another means of strengthening relationship inheres in the more direct self-representation that digital media has made possible for nonprofit organizations. The ability to directly send messages to stakeholders via websites or emails heralds independence from traditional media gatekeepers who in the past may have partially represented or even misrepresented an organization's mission and activities. Carboni and Maxwell (2015) suggest that if stakeholders are engaged with an organization through online platforms, they are more likely to engage offline as well. The direct reach of digital media may also afford NPOs the opportunity to improve their credibility, as interactivity has been argued to foster trust. The readiness with which digital media enables NPOs to provide details of governance, financial and other activities, ostensibly

unmediated by a media middle-man, may enhance the perception of organizational transparency on the part of their stakeholders.

Digital media offers immediate and enticing potential financial benefits, too. Websites provide content richness and design flexibility, at low cost; email postings eliminate the costs of hard copy mailings; fundraising drives may be conducted by text messaging rather than by flyers or brochures. Additionally, particularly in the early days of the twenty-first century, NPOs seized enthusiastically upon the possibilities for fundraising made available through new media, anticipating that the reach of digital media could secure new sources of funding where traditional avenues had dried up. A number of studies of NPOs have revealed that the enhancement of donations and fundraising has not always been accomplished via digital channels (Branston and Bush 2010). However, while online giving still represents a modest percentage of overall philanthropic giving, it is the fastest growing avenue for donors to support NPOs. Online giving grew 13% between 2014 and 2015, with funds raised via social media growing 70% in that period (Campbell 2015).

A number of NPOs have found digital media to have profoundly improved their ability to deliver services to their publics. Nonprofits working in the health sector have as a key part of their mission the provision of information to populations with particular health concerns or conditions. The wide disseminability and forwardability of email messaging can vastly increase the effectiveness with which information is provided. Similarly, NPOs working to connect newly settled refugees with community support and services might use social media to mobilize volunteers within communities to provide new migrants with needed assistance.

Digital media has broken down many traditional barriers and divisions faced by nonprofit organizations. The speed of transmission via digital channels has enabled NPOs to transcend traditional temporal delays, responding with timeliness and agility to breaking events or emerging areas of need, producing reports and appeals within minutes or hours as opposed to days or weeks. In the case of international aid agencies like the Red Cross, humanitarian aid may be mobilized while a crisis is unfolding. Interest groups may organize rapidly following significant news events or political announcements, reports may be live tweeted from annual general meetings, and so on. As geographical distance has evaporated as a factor limiting the reach of communication, regional and national operating divisions have dissipated for many larger NPOs, resulting in restructurings. New structures have also reflected a breakdown in traditional role divisions, as communications and marketing functions have increasingly integrated. In many ways the nonprofit sector might be said to have become truly global in its scope and operation. Finally, digital media has dissolved traditional barriers between producers and consumers of content, meaning an NPO's stakeholders may take a significant role in shaping and even creating the organization's message.

One further opportunity presented to NPOs by digital media is a vastly expanded ability to gain and store information about their publics. Web analytics provide information about the number of visitors to a website, and the number of page views, helping gauge traffic and popularity trends, and enabling commercial marketers and NPOs alike to better determine audience preferences. As individuals undertake activities online, transmitting more and more personal information, organizations can deploy analytics with ever greater sophistication to learn more about the online and offline characteristics of their site users. Even as regional and national operating divisions have declined within NPOs, audience segmentation has become a tighter focus, made possible by analytics and data mining software. This enables NPOs like Oxfam to target communications to historically reliable donors for additional donations when a natural disaster strikes, for example, or the SPCA to alert ailurophiles in a particular suburb of an upcoming cat-adoption drive.

## Challenges and Risks

Despite their potential benefits, digital media may incur unanticipated costs and provide limited returns. The regular monitoring of digital channels and the swift response increasingly required by users demand time and knowledgeable

personnel. NPOs using digital media rely on their stakeholders having access to those media, which is not always the case. Additionally, studies suggest digital media may create only weak connections to the organization, which do not prompt stakeholders to volunteer or donate.

Studies of NPO engagement with digital media show that many have used new media in much the same way as they used "old" media, tending to continue a "push" strategy of top-down, one-way information dissemination. While NPOs have evinced a keen interest in many digital opportunities, particularly in the area of social media, they have often failed to take full advantage of the relationship-building possibilities inherent in digital platforms. As a result, they continue to lag behind the corporate sector in terms of effective use of information and communication technologies. One reason for this may be a lack of strategic consideration of the particular characteristics and corresponding needs of individual technologies. For example, Facebook sites require regular monitoring and swift responses to posts in order to prevent the departure of audiences who might feel their voice or contributions are ignored. Another reason may be inadequate resources in terms of time and knowledgeable personnel, both of which are essential to provide the authentic and personal engagement demanded by digital natives. Smaller and less-resourced NPOs may entirely lack specialist Information Technology (IT) support. A number of scholarly studies have raised doubts as to the effectiveness of social media in fostering dialogic engagement with NPO publics, with one study of the Facebook sites of 50 environmental advocacy groups revealing the majority failed to use the sites to engage interactively (Bortree and Seltzer 2009).

Certainly, expectations of organization–individual relationship have been raised. In terms of relationship engagement, new channels have led audiences to expect and demand interactivity, and regularly updated content. If an organization does not provide these via its digital media, potential supporters may withdraw. Challengingly, the increasingly diverse demographic groups accessible by digital media may also express different desires concerning communication content, channel, and frequency. Digital media's myriad possibilities may mean interests of some of the groups represented by NPOs go unheard. This may result from suboptimal channel choices, as, for example, retirees may be less likely to be active Twitter users. It may also result from a lack of monitoring of comments. Importantly, not all service users have Internet access, meaning that unless a blend of traditional and digital media channels is used, certain groups may not have their needs met. One factor attending increasingly globalized operations is the growing reliance of NPOs on the publics they wish to engage having access to information and communication technologies (ICTs) and Internet-enabled devices, and some commentators believe the digital access divide has become more pronounced than ever.

Despite the emergence of certain viral campaigns, digital media has not regularly or predictably supported the recruitment of volunteers and supporters, either. While digital media enables the formation of more connections between NPOs, causes, and audiences, these are not necessarily strong connections. "Clicktivism" refers to weak or purely notional forms of charitable support, in which electronic signatures on an email petition or "likes" secured by an organization's Facebook presence do not translate in any measurable way to an increase in tangible involvement with or commitment to an organization's initiatives. Rather, these weak connections may in fact render audiences less likely to actively participate in a cause.

The financial challenges faced by NPOs have not, as was initially hoped, been countered by digital media. Studies have shown the limited efficacy of fundraising drives undertaken via digital media (Branston and Bush 2010). NPOs were also often following a corporate business model that was not always fully applicable to the nonprofit sector, in terms of heavy focus on and investment in image marketing. Embracing digital media can lead to considerable savings of time and money over utilizing traditional media, as outlined above, but digital media is not "free." Even "cheap" communication channels like social media require substantial resources – time, stable and knowledgeable staff, technical support.

Considerable financial resources are required to produce certain kinds of content such as videos, podcasts, or infographics, and to make structural investments in software and hardware. A further challenge is posed by the very ubiquity of digital media, and the proliferation of digital content. NPOs must cut through crowded email inboxes and overwhelming digital "noise" to secure readers, let alone potential supporters, volunteers, and donors.

The rate of change poses a series of challenges of its own. NPOs, trying to adjust to a swiftly changing digital environment, learned through active and ad hoc engagement with different platforms, with greater or lesser degrees of informed leadership and strategic planning. As Hackler and Saxton (2007) have shown, NPOs sometimes only articulated a digital strategy well after they had begun engaging with a variety of channels, and sometimes failed to create a strategy at all. As platform deployment proliferated in response to normative pressures, the pace of adoption and the frequent lack of a coordinated digital strategy meant content was often undifferentiated across platforms and not optimized to the characteristics either of the channel or of its particular user group.

The pace of change placed yet more pressure on NPOs in relation to securing sufficient and appropriately skilled personnel. In line with ad hoc platform adoption, staffing and recruitment decisions were often reactive rather than proactive. For example, social media management tasks were handed to interns or volunteers solely on the basis of their youth or supposed digital savvy. Especially in the early years of the twenty-first century, communication decisions were often entrusted to those in technical roles rather than to communication professionals. During this initial reactive period, little or no training for communication staff was provided, despite scant or nonexistent knowledge of optimal use of digital media tools. At the same time that skilled personnel, who could earn much more in the corporate sector, were hard for NPOs to recruit, key decision makers lacked technical skills and expertise. Even today budgetary limitations often mean untrained NPO staff may be charged with developing and wielding specialist tools.

Digital technologies may be a boon or a threat to NPO operations. In some cases digital media enables NPOs to be entirely bypassed. For example, the creation of sites like GoFundMe and various crowdfunding initiatives mean charitably inclined individuals can "donate directly" and avoid contributing to organizational overheads. Donation decisions are increasingly linked to information concerning the percentage of the donation that will go directly to those in need. On the one hand, this means that NPOs must meet ever-increasing demands for transparency. But on the other, network technology makes organizing collective action much easier – making organizations less important. Additionally, it has been claimed that digital activism has become counter-productive, drowning local, grass-roots, and radical voices in a flood of often ineffectual petition drives that may alienate potential supporters.

Finally, new ethical considerations have arisen in relation to the opportunities provided by digital media, meaning the emergence of new risk management demands. NPOs may gather an enormous amount of data from their digital media users, information that may be used to segment audiences and tailor news and appeals with increasing sophistication. But the degree of surveillance made possible by digital media causes many commentators concern, as the scope and the invisibility of observation raises as-yet unanswered questions about organizations' ethical requirements around the storage, manipulation, sharing, and even sale of the information they gain from their digital "customers." Given the politically sensitive work done by many nonprofit groups, the risks of metadata and the vulnerability of identificatory information about their stakeholders are particularly concerning.

## Future Directions

How to mobilize the opportunities suggested by digital media is a persistent challenge for the great majority of NPOs, which tend to be small scale, characterized by shrinking budgets and strictly limited resources in terms of both staffing and

time. An entirely new industry has arisen to advise NPOs on digital and social media strategy. Due to the dynamic nature of digital media development, the rapid obsolescence of advice means this is a burgeoning field.

Nonprofits need to modify their goals for digital communication. To date, digital media has produced only modest gains in terms of recruiting volunteers and raising funds, although a recent study indicates charitable giving via digital means is growing. Relational goals may be more achievable, but true dialogic engagement with publics takes investment and commitment.

Additionally, it is clear that one-size-fits-all messaging does not work – a variety of channels needs a variety of approaches. NPOs must ask challenging questions about platform proliferation, as more is not necessarily better. The demands of managing stakeholder relationships, always essential to NPO mission, are shifting and accelerating in a digitized world. NPOs must recognize that interactive and personal engagement is demanded by consumers of digital media, and only engage with digital media channels where they are able to support the interactivity required by the characteristics of the channel and its audiences. Additionally, differences within the nonprofit sector must be recognized and catered for at the strategic planning stage. Research has shown stakeholder preferences regarding digital communication differ between different segments, meaning NPOs in differing segments should tailor communication strategies particular to their groups.

NPOs should capitalize on the possibilities for monitoring information delivery and information uptake made available by digital media, and use the data both strategically and ethically. While commercial marketing research has not always proved directly transferable to the nonprofit sector, NPOs can and should benefit from the body of knowledge emerging from the growing field of analytics. Even nonexperts can use Google analytics to analyze website visitation patterns, and NPOs using platforms like Mailchimp for e-newsletters can easily examine open and click-through rates, and tailor their communications accordingly. They must, however, maintain transparency around how they are collecting, using, and potentially sharing data about their stakeholders.

Different demographic groups vary in their degree of interaction with digital media, and in their channel preferences. While the older generation has traditionally made up the majority of nonprofit volunteer and donor bases, this group presently engages with digital media to a far lesser degree than millennials. However, the number of "silver surfers" continues to rise, and the unique demands of this group, in terms of channel, content, and accessibility, must be taken into account by NPO communication personnel. Ultimately, not all groups can be reached by digital channels, and NPOs need to recognize that digital media cannot replace traditional means of engagement of publics. Face-to-face engagement will remain an invaluable tool. A coordinated suite of traditional and new media platforms will continue to be needed to ensure NPOs' vitality and sustainability.

## Conclusion

The nonprofit sector has embraced digital media, with high hopes that digital platforms and channels can assist them to achieve relational and financial goals. While cheap, responsive, and interactive, digital media has not solved all the sector's problems, and has created some new ones, among them challenges around staffing and the ethical management of data. More research into how digital technologies affect social and civil structures in the longer term is needed. While that work is being done, NPOs must be willing to continuously interrogate and adjust their communication strategy for digital media. NPOs must acknowledge that traditional one-way information dissemination does not suit digital media or digital natives and that thoughtful responsiveness to stakeholder input is essential. Haphazard approaches via fad technologies to poorly understood publics cannot support the survival, let alone the flourishing, of the nonprofit sector. In a clogged digital sphere, in which messages proliferate and audiences are increasingly

time- and attention-poor, clarity of message focus and of organizational identity is more important than ever.

## Synonyms

Adaptation; Career condition; Digital social innovation; e-Readiness; e-Society; Exceptional individuals

## Definition

Digital social innovation introduces and covers the digital technologies to co-create knowledge and solutions for a wide range of social needs. Disabilities work condition is one area that has mass challenges. Nonprofit organizations like a digital social innovator have the potential to meet these kind of needs through the means of technologies.

D

## Introduction

The society consists of several groups with their own special needs. Organizations help to supply their needs and overcome their obstacles and problems. But sometimes new solutions cannot go on their way and need further attempt. In this situation, social innovators like nonprofit organizations try to solve the problems. They produce new solutions to social problems in many areas such as welfare, health, education, unemployment, etc. One of the area with less attention refers to disabled people. They have different life aspects including health living, safety, schools, etc. Though of some attempt in this area, many problems are not solved or even studied yet. One of these vacancies relates to disabled career conditions. Nowadays a huge improvement in technology can facilitate their career condition. AT, IoT, ICT, IT, or robotics bring a lot of tools to cover the disabilities and physical deficiencies. But it seems that technology could not be beneficial as much as expected. What is wrong? Technology without any adaption, readiness, implementation, and change plan in governmental, organizational, and individual level cannot penetrate well. Digital social innovators can bring the voice of technology to the e-society in support of career condition of exceptional individuals. Digital social innovation (DSI) is an emerging field to support the society needs by the use of digital tools for social change. The entry tries to bring latest technological innovations in the world and specially the suitable ones for exceptional individuals' career conditions and then the role of digital social innovators like

nonprofit organizations to join these capacities. Besides society awareness, it can help to have better policy making and proper training plans for changing and improving the work skills and opportunities in a more justice environment in e-society.

## Digital Social Innovation

Social innovation is the application of new solutions to social problems in areas such as welfare, health, education, youth unemployment, adaptation of migrants, and territorial integration of regions.

Social innovations allow nonprofits and other organizations to meet the needs of the society more effectively than existing options, respond to social challenges, offer new solutions to social problems, develop social interaction, and create alliances (Caulier-Grice et al. 2012). It may refer to product innovations, service innovations, or process innovations. Nowadays digital social innovations introduce and cover the digital technologies to co-create knowledge and solutions for a wide range of social needs. It tries to develop open data infrastructures, knowledge co-creation platforms, wireless sensor networks, decentralized social networking, free software, and open hardware to raise awareness and collective actions. A growing movement of innovators in civil society, tech and social entrepreneurs are now developing inspiring digital solutions for a variety of social issues in areas such as health, democracy, consumption, money, transparency, and education. It can be supported by governments, public organizations, companies, enterprises, nonprofit organizations, or NGOs. More often they emerge at the hybrid intersections among different sectors.

Nonprofit organizations are very important for creating social innovation and are believed the primary sources of social innovations due to their social mission and interests of certain groups, recipients of their services, who are end-users (Anheier et al. 2014), forming new relationships and networks, modifying the ways of interactions, contributing to changes in organizational structures, high aptitude for experiments, sensitivity to the needs of the clients, capacity of engaging volunteers, different stakeholders, and attracting assets from various sources, developing and implementing innovative services or new methods of delivering community services, having a capacity to involve various actors and volunteers in their interactions. The flexibility of nonprofit organizations makes them behave and act more efficiently than governmental strictly regulated systems (Krasnopolskaya and Minnigaleeva 2017). This concept is new and is not well studied yet but seems to be crucial in exceptional individuals life aspects especially their career conditions.

## Exceptional Individuals' Career Condition

The society consists of several groups which can be distinct from other population and have their own characteristics. These groups can be categorized based on gender, race, socioeconomic class, and people with physical, mental, or emotional functioning such as disabilities. They include of impairments, activity limitations, and participation restrictions. Physical and mental differential lead to different life aspects such as health living, safety, assistive technology, schools, transitions, independent living, support, and career conditions. The notable percentage of people are disabled with the career condition problems. The uncomfortable work situations cause anxiety, depression, and loss of confidence, a reduction in self-esteem and the level of general happiness. Career condition is the important issue which can be discussed in various aspects: law, transition programs, facilities, etc. e-Society is facilitating and influencing on exceptional individuals' career conditions in near future. Being familiarity with the newest and latest innovations can be certainly helpful for exceptional individuals to manage their aims and assays. They can participate more in social activities include of career situations. Technology provides facilities and can help to overcome the obstacles easier. Some important cutting-edge technologies for exceptional

individuals are assistive technology (AT), information technology (IT), internet of things (IoT), information communication technology (ICT), and robotics. Though the importance and strength of the technology, it cannot be useful alone without any cultural and supportive plans. In the case of exceptional individuals, it becomes more critical due to their mass of limitations. So there is a further organizational support to meet their needs. Social innovators and especially digital nonprofit organizations can meet this type of social needs in a better way than the existing solutions. They can help e-society members, policy makers, and managers to accept the technology in the field of disabilities' workplaces.

## Exceptional Individuals in e-Society

### Assistive Technology (AT)

Assistive technology device is defined as any item or equipment to improve the functional capabilities of a person with a disability for learning, daily living, listening, augmentative communication, computer access and instruction, environmental control, mobility, prevocational and vocational, recreation and leisure, seating and positioning, and visual aids (Barge 2016).

The AT covers physical/situational products (for physical needs), such as: scooters and wheelchairs, alternative automobile controls, environmental controls, prostheses, communication aids, hand splints, hearing aids, and alternative computer's input and output devices.

AT also facilitates virtual needs for people with visual, hearing, mobility, or learning disabilities. Specific web site design, Video iChat to improve social studies and facilitate communication, touch and speech feature controls for individuals with difficulty movement, text-generating hard and software such as word processing, word prediction, and word-cueing programs for handwriting, Speak Key Presses Calculator, Grapher, Voice Over and Screen Reader to facilitate reading, MacBook Pro (Mac computer's Braille-output capabilities), and iPod touch to facilitate composing are the examples for hearing disabilities. Text-Edit to type, Converted text to audio plan application, Built-in Screen-Reading, Braille-Output Capabilities, and Speech synthesis in conjunction with word processing is useful in enhancing visual disabled students' written language production. Wheelchairs, walkers, crutches, canes, prosthetic devices are suitable for mobility disabilities. It seems that assistive technologies not only provide better situations for exceptional individuals to learn better but also can be used in work places to make works easier.

### Teleworking in the Information Technology Era (IT)

Information technology is defined as the use of any computers, storage, networking and other physical devices, infrastructure, and processes to create, process, store, secure, and exchange all forms of electronic data. People are changing in the information age and huge transitions have been occurred. Emergent of virtual organizations is one of them. It is described as "an extremely loose web of individuals, capital and technologies operating in collaborative networks uninhibited by time and space" (Barnatt 1996; Birchall and Lyons 1995), employed, self-employed, and home-based teleworkers, remote site, and mobile telework. Konradt et al. (2000) explained that telework is a kind of work which is partially or completely done outside the workplace. These job categories can easily be done by the use of telephone, fax, or email with flexible work locations and remove the organizational boundaries of the traditional and centralized workplace.

Benefits of teleworking for organizations are: enhancing job satisfaction, flexibility, more productivity, less absenteeism, reduce office space, easier staff recruitment, and retention. Some teleworking jobs are suitable for mobility disabilities. Some examples are: account management, accounting/taxes, administrative, analyst, bilingual, business development, call center, case manager, consulting, customer service, data entry, development engineering, entry level, finance, human resources, information technology, insurance, Linux, management, telephone or internet marketing, NET, PHP, project management, Python, quality assurance, recruiter sales, software development, and SQL or Web developer.

Effectiveness of each job depends on the disability condition. Telephone marketing can be useful for mobility disabled due to no need for movement, web developer for deaf due to no need to speak or listen, and consulting in any area for blind due to no need for seen. A precise investigations can help to distinguish suitable teleworking jobs for disabled. So it leads to have more proper training and education plan according to the specific abilities and facilities. Policy makers should consider a proper job analyzing to match the everyday suitable emergent jobs with organizational positions.

### Information Communication Technologies in Organizations (ICT)

Information communication technologies (ICT) refers to technologies that provide access to information through telecommunications. It is similar to information technology (IT) but focuses primarily on communication technologies. This includes the internet, wireless networks, cell phones, and other communication mediums. ICT is used to handle telecommunications, broadcast media, intelligent building management systems, audiovisual processing and transmission systems, and network-based control and monitoring functions.

ICT in the organizations requires access to own computer or sharing, internet connectivity, access to internet and World Wide Web, high bandwidth availability for accessing the network, quality of connectivity to the network, website availability for business promotion, availability of LAN, diversity of ICTs in identifying, storage and information retrieval, online business transaction implemented, e-commerce, broadband access availability, and use of network (Mutula and Van Brakel 2006). Adoption of ICT in the organizations leads to the huge changes such as: performance, process, structure, environment, regularity, competency, and infrastructure. In this shift of manually works to machinery ones, ICT has considerable impacts on workers. Knowledge replaces physical activities. Problem-solving, statistical process controls, computer skills, new working practices, team works, quality circles, job rotation, multitasking, and interpersonal abilities are what workplaces need in the ICT world. ICT workers need the ability to evaluate, organize, manage, maintain, access, analyze, use, identify, and retrieve the information. It seems that some important obstacles like physical skills are now disappearing and the growing need for knowledge workers is emerging. Disabilities have more opportunities to come into workplaces in this situation. Policy makers and managers need to consider suitable adoption, readiness, and change plans to enable their organizations for better use of facilities and staff opportunities. There are various models that consider the international, national, organizational, and individual ICT aspects in infrastructure, structure, goals, and human resources. Training and educational programs need to be updated according to the newest workplaces' situation and requirements.

### Internet of Things (IoT)

Internet of things (IoT) defined as a system of interrelated computing devices, mechanical and digital machines, objects, animals, or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction (Pawade and Wasukar 2017). IOT is going to penetrate all aspects of human lives, such as: smart cities, smart environment, smart water, smart metering, security and emergencies, retail, logistics, industrial control, smart agriculture, smart animal farming, demotic and home automation, and e-health in near future. But what does IoT brings for disabled? Some specific functionalities are enabled by IoT for disabled people, such as: remote support and services, speech activated devices, and automated accessibility functions in public spaces for physical and dexterity people, interpretation of user environment for way finding, near field automation, and speech-activated devices which communicate with speech output for visual disabled, captioning in glasses delivered by beacons, and visual cues about status of home devices on mobile device

for hearing disabled, localization and orientation, automated reminders, and programmable safety processes for cognitive disabled. These are just the direct impacts of IoT on exceptional individuals.

Again IoT can provide facilities in organizations and workplaces that can lessen the mobility and physical skills and abilities and focus on virtual world. Some organizational opportunities that are brought by IoT are: e-business in transforming key business processes to reach the global marketplace and improve current business and competitive advantages, e-maintenance as e-technologies (ICT, web-based, tether-free, wireless) in integrating with new trends such as e-monitoring, e-diagnosis, and e-prognosis to remote and real-time knowledge assessment of system performance, cloud manufacturing in enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable manufacturing resources, e-science as a platform for scientists to share their knowledge and science, e-invoice as a kind of information system service for gathering transaction information, e-portfolio as a network application for providing the author with administrative functions for managing and organizing work, e-commerce as selling and buying of products or services over the internet to allow a helpful analysis of the data which further aids in the business intelligence, product suggestions, and recommendations, and the fraud detection, e-library as a library in which collections resources are stored in digital formats as opposed to print, microform, or other media and accessibilities by computers, and e-procurement as the use of information technologies to facilitate B2B purchase transactions. It involves six forms of activities, including e-ordering/e-maintenance repair operate, web-based enterprise resource planning (ERP), e-sourcing, e-tendering, e-reverse auctioning/e-auctioning and e-informing, e-learning as an internet-based learning process, using internet technology to design, implement, select, manage, support, and extend learning which are used in universities or in similar conditions (Table 1).

**Digital Social Innovators, Table 1** Direct and indirect impact of IoT on disabilities' career condition

| Direct impact | Indirect impact |
|---|---|
| Speech-activated devices | e-Business |
| Automated accessibility functions | e-Maintenance (e-Monitoring, e-Diagnosis, e-Prognosis) |
| Environment interpretation for way finding | e-Learning |
| Near field automation | e-Science |
| Speech-activated devices | e-Invoice |
| Captioning in glasses by beacons | e-Portfolio |
| Visual cues | e-Commerce |
| Localization and orientation | e-Library |
| Automated reminders and programmable safety processes | e-Procurement (e-Ordering, e-Sourcing, e-Tendering, e-Reverse, e-Informing) |

It seems that IoT can lead to a huge change in disabilities life but there are not notable researches in this area especially about the probable revolution of their career conditions.

## Robotics

Robots are electromechanical devices with multiple task capability and programmability that can sense, think, and act in repeatable cycles (Argote et al. 1983). The skill requirements for production and personnel technical support will be changed from manually oriented to mentally by the use of robots. Some robots that are used in companies are: the Locus Robot for logistic operations like quick finding, packaging, and shipping online orders in warehouses, Lowes Oshbots for helping customers to find and managers to track inventory, Chloe for shifting through music, movies, and games, and bringing customers what they want, Yotel butlers for taking care of guest bags and cleaning rooms. Again like other technologies which are discussed above, these shifting activities from manually toward mentally ones lead individuals to concentrate more on analyzing and handling systems more than operating activities. It again provides opportunities for

**Digital Social Innovators, Table 2** Direct and indirect impact of robotics on disabilities' career condition

| Direct impact | Indirect impact |
|---|---|
| Obi Dining Robot to help feeding | Locus Robot for logistic operations |
| | Lowes Oshbots to track inventory |
| Toyota Human Support Robot (HSR) to help moving | Chloe for shifting for bringing customers what they want |
| | Yotel butlers for taking care of guest bags and cleaning rooms |

exceptional individuals who suffer from physical disabilities to inter to the workplaces for less physical activities and more handling and managing ones. Some specific robots are only for exceptional individuals like Obi Dining Robot to help feeding or Toyota Human Support Robot (HSR) to help moving. It is needed to develop more robots to help exceptional individuals in workplaces (Table 2).

## Adaption and e-Readiness Approach

Nonprofit organizations can act as a digital social innovator in career condition of disabilities in e-society. Penetrating technology in exceptional career conditions have gotten engaged with multi-faced and multi-level aspects and needs to be coordinated with governmental, organizational, and individual capacity. Many theories and models try to illustrate the influencing factors in technology adaption and e-readiness area. It can be useful for a nonprofit organization to assess the degree of disability conditional adaption and e-readiness.

For example in social and governmental level, digital social innovators should consider economical and social environment, ICT policy, cultural and learning development, geographical scattered, ICT industrial, tax, information transaction, national content, perception, productivity, citizen knowledge, industry characteristics, market structure, technology support infrastructure, and government regulation for external task environment to help policy makers develop facilities for career condition of exceptional individuals.

A nonprofit organization should assess how much a society is ready for exceptional individual physical infrastructure and integrate current ICTs throughout business and communities and everyday life of people and then give solutions for it.

In organizational level, digital social innovators should consider communicational and organizational infrastructure, managerial support, organizational culture, customers, expert workers, access, speed, quality, technology use, workplace, industrial competition, cost, computer and internet, electronic learning, learning content, ICT strategic development, formal and informal linking structure and communication processes, size, and availability. Each of the factors is important and need deep studying. It is necessary to understand where it is more possible to use disability capacity, in which industry characteristics, public organizations, market, SMEs, enterprises, etc.; or which organizational size is more appropriate for exceptional individuals; or by which speed and quality they can work easily without reducing the workplace productivity; and if the learning content in schools and university published well and accordance with requirements to provide enough working knowledge for them. These kind of analyzing can help to make suitable and beneficial strategies for disabled career conditions. Information security risk management and being connected with a service provider and supporter can help organizations to jump the obstacles.

In cognitional level, it should be considered that if the disabilities understand their performance and outcome expectations, they have enough personal and self-efficacy, or are affected by anxiety. What is their attitude, norm, perceived usefulness and ease of use, extrinsic and intrinsic motivation, perceived behavioral control, relative advantage, image, visibility, compatibility, results demonstrability, and voluntariness of use toward technology? To improve their cognitive factors toward technology, a nonprofit organization can develop training and information sessions, increasing their knowledge, help them understanding and feeling of independency by using technology to complete their tasks, having enough support by manuals or systems, learning easily how to use the technology, and also understanding

its usefulness, convenience, and quickness. Creativity training, team-based collaboration, learning especial skills, customizing applications, encouraging awareness, and rewarding programs can be beneficial in this field.

So digital social innovators and especially nonprofit organizations can help to improve multi-level and multi-aspect of the e-society for acceptance of technologies in career condition of exceptional individuals.

## Conclusions

Going along the twenty-first century with every day emergent of new technologies leads to solve many challenges. Some of these technologies include IT, ICT, IoT, AT, and robotics. Disabilities are the part of the society with different life aspects. Disabilities' career condition with the technological perspective was mentioned in this entry. Technologies are not apart from each other and conjoin the whole powers to make opportunities. Remote access, ability to organize, less need in physical activities, helping to cover deficiencies through devices and tools, huge storage, and big data analyzing are some of the issues pointed in the entry. Though of huge improvement in e-society, technology cannot overcome the obstacles on its own. Social and individual capacity besides technological improvement are needed too. Technology cannot reach to achievement without good infrastructure, structure, goal, human resource learning and training, suitable adoption, readiness, and change plan. These facilities can be studied and supported by further organizations like digital social innovators. Nonprofit organizations are ones that can facilitate technology use in disabled workplaces by helping to replace the manual jobs by expert ones with computer thinking skills like analyzing, systems designing, problem-solving, and consulting. Nonprofit organizations help managers and policy makers to consider technological improvements which are beneficial for the exceptional individuals to overcome physical deficiencies and also suitable plans to use the capabilities of disabled people in workplaces. Exceptional individuals need to learn proper educational programs in e-society too. There was not enough literature about exceptional career conditions especially with technological perspective by the help of nonprofit organizations. So future studies can be assigned to this issue with precise details.

**Digital transformation** reflects the improvements implemented by governments, in the search for innovative digital solutions due to social, economic, political, and other pressures, in order to transform their internal and external processes, to generate higher public value and for the effectiveness of government actions.

## Synonyms

Accountability Systems; Governance; Public Innovation

## Introduction

It is undeniable that a percentage of the cultural, political, and economic dimensions and other human activities escalate with the increase in digital space. Data indicate that three billion people use the Internet, but 90% of the remainder live in the developing world (ITU 2014). Smartphone users also spend 89% of their time interacting with mobile media applications (Nielsen 2014).

In order to prevent governments from neglecting this digital space as a potential ally to extend the value and delivery of public services, utilizing the physical and digital worlds, this proposal of interaction between services for public issues and the use of digital space as a basis for interaction is called Digital Government (DG).

It is obvious that advances in Information and Communications Technology (ICT), which started around the world in the 1980s, and in Brazil in the 1990s, promoted a transformation and improvement in the quality of public services, increasing operational efficiency, a reduction in costs, productivity gains, and an improvement in the quality of public services, allied to increased interaction with society (Gil-Garcia and Pardo 2005).

However, over time, it was observed that for ICT to generate improvements in the public sector, changes must not be limited solely to the implementation of technological elements in governments (hardware and software), but should also include procedural and cultural changes in those working in public administration. Therefore, it is vital that the adoption of ICT tools also includes routine process, legal and behavioral modifications, aiming towards greater efficacy and effectiveness in the public services provided to citizens.

In the light of public administration adopting digital government as part of the government agenda evolving into other aspects in the near future, digital transformation impacts the modus operandi of public administration and its relationship with society. While observing that there is no universal model to implement government digitization efforts in different national contexts and sector locations, advances are only achieved with the adoption of precise locations and diagnostic solutions via public governance searches.

## Electronic Government, Digital Democracy, and Innovations Related to State-Society in Brazil

Facing the greatest ICT appropriation by the government sector, the term "e-government," or electronic government, emerges; it is a concept related to the greatest intensification of ICT use in modernization actions linked to public administration, ranging from the computerization of internal

activities to the expansion of communication and provision of public services to external clients – citizens, suppliers, companies, or other government sectors society – via use of the web, with the creation of government sites (Pinho 2008; Agune 2006; Chahin et al. 2004).

Janowski (2015) proposed a model of evolution for digital government with four increasingly complex phases in the evolution of the concept: digitization (technology in government), transformation, engagement, and contextualization (policy-oriented public governance). The evolutionary model is based on three binary variables: (a) digitization complements inner workings and government structures; (b) the transformation is internal and to the government structure, as well as its relationships with citizens, businesses and other stakeholders; and (c) if the transformation depends on a particular application context, such as a country, location, or sector.

Thus, the phases are systematized as follows (Janowski 2015): Stage (1) digitization or "technology in government" does not produce any internal government transformations, changes in external relationships or dependence on the application context; Stage (2) processing or "electronic government" promotes the internal transformation of the government but not the transformation of external relations and, therefore, does not depend on the application context; Stage (3) Engagement or "e-governance" promotes both the transformation of internal government and external relationships but does not depend on the application context; and Stage (4) Contextualization or "policy-driven governance" promotes both the transformation of internal government and external relationships and depends on the application context.

In Brazil, formalization of including the topic on the governmental agenda took place with the creation of the Electronic Government Executive Committee in 2000 and the Electronic Government Policy in Brazil was launched the following year. Through Decree no 5.234 on July 7, 2004, electronic government was created to link and coordinate the implementation of electronic government actions, the provision of public services via electronic means, and the standardization of actions and dissemination of electronic government information to the federal public administration.

Since then, the implementation of successful practices has been observed, highlighting the Federal Inland Revenue annual income tax declaration system; the government purchase system using an electronic trading system; the election system, with the use of electronic ballot boxes; and the federal government's people management system (Sigepe), among others.

However, Diniz et al. (2009) state that although the Electronic Government Program has been successful, in 2003 the government started to reduce its importance, mainly due to the transition in presidential management. According to these authors, in 2016, the Federal Court of Auditors (TCU) prepared a report on the Electronic Government Program under Luiz Inácio Lula da Silva's government and observed the difficulty in coordinating program actions and the lack of monitoring of electronic government initiatives. In 2016 a federal government services site was created (www.servicos.gov.br) through Decree No 8.936, on December 19, 2016, which aimed to centralize digital services and facilitate access and follow-up by citizens. One thousand, eight hundred and seventeen (1,817) services from 85 institutions and federal public authorities are currently available, and 43% of these have fully digitized steps.

While considering the digital transformations of its interface with society, expansion tools are being promoted for state-society interaction, with the goal of more effective public actions, which involve various initiatives that represent the term e-democracy or digital democracy (Dahlberg and Siapera 2007). Digital democracy can also be deemed a conceptual innovation, since it promotes a state-society relationship through a new perspective, transitioning from an offline view, a model with higher government preponderance, to an online view in which society is more prominent and has the capacity to influence the public policy cycle.

However, for conceptual innovations to be converted into public policy changes and,

consequently, to take these transformational changes to the state-society relationship, specific policies need to be prepared, and instruments developed to enable the practice of this new form of interaction. The development of studies and applications based on ICT to foster the state-society relationship has created a productive area for innovation.

As an example, Sampaio (2013) performed a survey of digital democracy initiatives by the three authorities and the three government spheres in Brazil, having identified 96 experiences, with the majority developed by the Federal Executive Authority, followed by the state and municipal legislative branches. As far as popular participation is concerned, the majority fits into the e-information framework, followed by e-consultation and finally, e-decision. Due to the variety of mechanisms in place, this article will focus on some of the more widely disseminated ones, such as the disclosure of data and government information. The following discussion is organized based on the dimensions of participation, being analyzed in terms of innovation and its contribution to the strengthening of digital democracy.

### e-Information

When it comes to the dimensions of e-participation and e-information, progress has been made in the first stage in the country, especially due to the Law of Fiscal Responsibility (LRF). This has made mandatory the broad dissemination of information on the fiscal management of public entities in electronic format and public access, much of which is in real time. The Access of Information Law (LAI) established the obligation to publish information on the institution (active transparency), as well as the possibility of society requesting information (OGP 2011), which covers the opening-up of government data as a way to increase transparency and strengthen social control.

In the federal sphere, Decree 5.482/2005 established the obligation of making financial information available on the Federal Executive Authority Transparency site for institutions and entities with direct and indirect administration. In addition, each federal institution should have a shortcut to this site on their internet home page; however, the visibility given to promoting this is not the same for federal institutions, and there is not always sufficient information to allow political participation (Marques 2010).

The perspective that government information should be widely available to the public, although included in the Federal Constitution since is promulgation in 1988, was only regulated with the establishment of the LRF and LAI. The assurance of access to information by society must be considered a conceptual innovation, as although envisaged in the Federal Constitution, it only became truly effective with the approval of both laws.

A conceptual innovation will not necessarily bring innovation to public organizations, as it requires the concept to be converted into a product, service, or tool. By analyzing the compliance of LAI by states and cities, the Federal Public Prosecution Service (MPF) created the National Transparency Ranking and, in 2016, the average was 5.21 out of 10. These results show that cities and states face greater difficulties in making information available to society.

It is established in these studies that public institutions, although using the Internet to publish their documents, the information available is strongly linked to what is made obligatory by the LAI and LRF. Consequently, e-information has a greater focus on complying with current legislation, and there are still many flaws in government communication with society, based on ICT.

### e-Consultation and e-Decision

The two dimensions that propose a new bidirectional communication channel will be analyzed together, since different initiatives developed by a number of public institutions can be identified in both strategies.

One of the main e-consultation mechanisms is public consultation, which merges aspects of face-to-face and online participation, where both allow sending suggestions, proposing alterations,

and consulting other actions. The digital version has already been adopted by 30% of the ministries and 22% of the regulatory agencies, which indicate that it is not related to specific resources and that its acceptance is growing (Matheus 2009; Sampaio 2013). The Ministry of Health received 45 public online queries between 2001 and 2011, although only 13 reports were available, in which "there is no record of comments, suggestions or interactions between participants" (Barbosa 2015).

The digital version of consultation simultaneously represents an innovation in service delivery and makes advances in terms of conceptual and systemic innovation, but it is limited since the reports are not widely available and, principally, because the destination of the contributions received by this channel is not clear.

In the legislative branch, the House of Representatives created the e-Democracy site, with the aim of expanding popular participation in the legislative process, proposing different participative mechanisms, such as discussion of law bills, provisional measures, deliberative meetings, seminars, forums, and public hearings, as demonstrated in Table 1.

In Sampaio's analysis (2013), some topics discussed in e-Democracy were submitted for legislative review. As in the case of online public consultations, innovations developed by the House of Representatives contain conceptual and systemic innovation perspectives, although the absence of a systematic return on participative mechanisms restricts its transformational potential.

**Digital Transformation, Brazil, Table 1** Participative tools for e-democracy in the house of representatives

| e-Democracy tool | Participation features |
|---|---|
| Interactive Audiences | Submit questions to deputies |
| WikiLegis | Suggest the composition of laws that are sent to rapporteur deputies |
| Participative Agenda | Vote on priority projects; those with the most votes are placed on the agenda |

Source: Prepared by the authors based on e-Democracy (https://edemocracia.camara.leg.br/)

In subnational governments, notably in cities, one of the most common mechanisms for listening to the population is participatory budgeting (OP), which has a digital version. Sampaio (2013) identified 37 digital participatory budgeting (OPD) experiences in 17 Brazilian locations, with the most popular being Recife, Belo Horizonte, Porto Alegre, and Ipatinga. These cities adopt different strategies that surpass the simple transposition of a face-to-face model to the virtual world.

In the case of Recife, traditional OP sets the topics that will be taken for an Internet vote or electronic ballot, which enabled an increase in the number of voters and, therefore, the result reflects the population's greatest desires. In Ipatinga, suggestions can be sent electronically and are then organized by the city hall, which then forwards those considered feasible for deliberation at face-to-face assemblies (Best et al. 2010; Possamai 2011; Sampaio 2013). In the Belo Horizonte OPD, voters can vote on specific options previously selected by the city hall (Cunha et al. 2014; Sampaio 2009). In Porto Alegre, the electronic OP (e-OP) corresponds to an expansion of the face-to-face version of the virtual world, which increased the number of voting participants (Best et al. 2010; Sampaio 2009).

OPD has shown to be a productive area for new features, and innovations can be identified in different categories: service innovation, when the digital version complements and reinforces popular participation; delivery innovation, when it creates a new category; public policy innovations, when changes are promoted as a result of learning from experiences. This is the case for Internet voting and the provision of equipment (computers and electronic ballot boxes) in various locations, specifically to increase participation. As for the degree of innovation, more specific changes can be characterized as incremental and since new forms to accomplish this are offered, they can be categorized as radical. The OPD data presented here do not allow for characterization in the case of transformational innovation, which would demand in-depth studies from that perspective.

Participation in the varying e-Consultation mechanisms is related to the debate and definition stages of possible alternatives, where different ideas are proposed for discussion, allowing proposals to be defended, rejected, or reformulated (Kingdon 1995; Possamai 2011). In some situations, ideas and proposals can progress, although one of the main weaknesses of these mechanisms is that there is no system for providing feedback to participants regarding the utilization, or otherwise, of their contributions. This generates questions on the effectiveness of these spaces and could lead to reduced participation (Rothberg 2010).

## Directions and Challenges

It is believed that ICT broadens and strengthens social participation and, consequently, promotes the improvement of digital democracy. It is emphasized that the tools developed in the field of digital democracy allow for the expansion of popular participation. Unidirectional government communication, with the disclosure of data via the Information Access Law, has made the most progress, reinforced by specific legislation that demands active transparency and the country's admission to the principles of an Open Government Partnership. In an analysis of LAI compliance, the actions of external (MPF) and internal (Comptroller General's Office – CGU) control bodies have produced an improvement in indicators developed by each of the public authorities, reinforcing e-information on electronic government sites.

On communication and bidirectional participation, there has been an increase in the use of dialogue channels that choose to capture society's insights, with instruments such as online public consultations, especially by the federal government and digital participatory budgeting; the latter being more commonly adopted by municipal governments. They are innovations in public policies that incorporate a conceptual and systemic innovation perspective when proposing new ways of communicability that aim to strengthen and increase civil participation. Discussion mechanisms are included in this perspective, such as enquiries, forums, and chats, among others, which enable not only conceptual and systemic interlocution with the government, but also promote dialogue among citizens, creating the opportunity to discuss different views on the same theme. This deliberative process can generate subsidies, which can be incorporated on the preparation of a final proposal for a public enquiry, or influence voters when voting on digital participatory budgeting.

On the other hand, conceptual innovations have certain limitations that restrict their results and limit them to a perspective closer to service innovation or service delivery, which, consequently, drive them further away from the possibilities of transformational change. One of the main criticisms of the online query mechanisms and virtual discussion tools is that, in general, participants receive no feedback on submitted proposals, meaning it is not known if they were taken into consideration and whether they contributed, or otherwise, to the decision-making process. This lack of return may discourage further participation, reducing the tool's credibility. To finalize, it is affirmed that ICT has generated innovation not only in e-Democracy and e-Participation, but also in terms of government management and services.

## Definition

**Open data** signifies a philosophy for saving, showing, and making accessible the collected public information by Governments of the world.

**Public data** implies the information of the citizen stored in the repository of the Government of the country.

**E-Governance** refers to the facility provided for the public services to the citizen of the country.

**Digital Transparency** deals with the uniformity in the distribution of the information to the citizens online.

## Introduction

Recent studies show a trend to store public data, gathered through web services, in Government repositories. These services constitute open data and are used to provide transparency, accountability, or information to the private sector of a country. This is a step beyond the passive transparency, which is based on the Right To Information (RTI). This RTI concurs with the declaration of the rights of man and citizens issued during the French revolution in 1789, especially with Article 11 that refers to the rights of every citizen to be able to write and print freely. In particular, the information known to and stored by the Government can be handed over to citizens and is linked historically with this right. The use of open data can provide considerable advantages for researchers, increase transparency (Bertot et al. 2010) and accountability, as well as increase citizens innovation and participation in public activities (Conradie and Choenni 2014). An open data barometer was created to observe whether countries worldwide are taking steps toward implementing this philosophy. The Open Data Foundation was also created to standardize the way open data from the governments is represented. Various model styles have been developed, such as the national administrative implantation model in Colombia (Datos Abiertos 2017; Gandía et al. 2016) and the open data maturity model, with a regional aim. In Venezuela, legislation exists that permits establishing the baseline for implementation of open data. The Law of Infogovernment specifically refers to the right to have public information published (Gobierno Abierto en Argentina 2016; Gobierno Abierto en Chile 2016; Gobierno Abierto en el Salvador 2016). Such law was notified on October 17, 2013 and executed 10 months later. However, it does not refer to open data specifically, and the lack of open data technical standards, projects, technological independence, and efforts hinders its deployment. Studies regarding transparency in local Governments have been conducted in the Czech Republic and Brazil using a research survey on a set of habitants. Such studies aimed to diagnose the level of passive transparency in the management of the public budget. It was demonstrated that transparency is an effective tool to maintain a sustainable management, although in some cases there was a negative reaction to the filling out of surveys. Although such studies were focused on passive transparency, they constitute a background for the study of open data in the framework of active transparency. In addition, determining which technological model should be employed for the storage, management, and delivery of high volumes of data presents another dilemma (Disruptive Views 2016). Some important enterprises such as Amazon Web Services (AWS) propose cloud computing solutions for open data (Cloud Computing 2017; Datos Abiertos 2017). For instance, AWS suggests to separate the cloud infrastructure from managed services, leverage third-party accreditations for security, privacy, and auditing, and define cloud evaluation criteria. The European Data Portal (2017) indicates a technical preparation and implementation for open data. They propose five steps for the technical process: data management; extract, transform, publish; channels; search; prerequisites, choices, and accountability. In general, technical guidelines establish that the channels might be: Web download (based on a content management system such as Drupal and Wordpress in combination with an internal database), data portal (open source and catalogues), and application programming interface (API) such as CKAN (2017) and DKAN (2017), Socrata, and Junar. Open data can also be used to e-vote during political elections. The first part of this work consisted of a transversal exploratory documental and non-experimental research study that was followed and supported by two levels of survey intended for a number of ICT experts from Venezuela, based on qualitative research regarding the administrative study. The first survey was administered to ICT directors electronically using Google Forms to collect national information. Next, recommendations were elaborated on and validated with three higher-level directors using an additional brief survey. The first level survey served as a starting point to locate focus areas. In the second part, a preliminary technical study was done based on

best practices and international directives to compare the scenarios of implementation: the presence of a cloud computing provider versus national data centers.

Section "E-Governance for Digital Transparency" of the article shows the administrative and technical problems initially. The second part indicates the state of the art for open data around the world. The third part explains the methodology followed. The fourth part shows the results and a proposal for implementation of open data. Finally, the fifth part contains the conclusions and recommendations of the study.

## E-Governance for Digital Transparency

For decades now, information has been generated and published through the Internet, and this tactic has progressively and dramatically increased. Consequently, better technologies to store, treat, and distribute the generated data are required. In the private sector, such technologies are called big data. Equivalently, in the public sector, enormous amounts of information are generated as the result of E-government using ICTs. However, not all the information is allocated within repositories freely accessible to the public due to various reasons. Open data is the name of a philosophy for saving, showing, and making accessible the collected public information by Governments of the world. Active digital transparency constitutes the basis for open data. In some countries, it has been deployed owing to legislation and citizen attitude. In Venezuela, this philosophy is not deployed sufficiently; therefore, it is ranked in one of the last places on the Open Data Barometer. The objective of this research work was to "propose administrative guidelines and a technical study on digital transparency for the public administration in Venezuela based on open data philosophy." The research question was: "What guidelines on digital transparency for public Venezuelan administration based on open data might be proposed?" Such guidelines were proposed from the results of surveys applied to measure the attitude of ICT directors regarding the Venezuelan public sector and the technical study.

### Concept of Open Data

Open data refer to the information being collected by Governments and administrations for their own function and that might be accessible for any citizen or organization. Open means that anyone can use, reuse, and redistribute them. This offer of the data does not imply an additional budget because the data already exist and are organized in closed databases in a structured way and prepared in adequate formats for the public. Open data enables the establishment of anticorruption methods, participation of the citizens, generation of economic value for the private sector, and improvements in the decision-taking process.

### State of the Art

Some bibliographical sources establish a relationship between digital transparency and open data (Cotino 2013). Digital transparency is the most modern version of traditional transparency using ICTs. E-Governance is based on open data. The first effort in this direction came from former President Barack Obama in 2009. Its aim was to permit transparency, accountability, and interaction with the private sector.

According to the Open Data Barometer, the first five countries of the 2015 ranking were Great Britain, the United States, France, Canada, and Denmark. In the USA, data has been provided for free information regarding agriculture, business, weather, consumer, ecosystem, education, energy, finances, health, manufacturing, public security, research and development. In France, data has been provided for free information regarding agriculture and feed, culture, education and research, sustainable development and energy, health, society, and national transport. Sets of international data have been provided in graphical form. Some other international open data initiatives are currently under development such as Global Open Data by the Government of Japan established after the Fukushima disaster in 2011. Regarding transparency specifically, projects such as the British model show how one Government is spending the budget. Open data in Canada shows and is permitted to increase taxes collected with charitable donations since 2010.

Several government websites exist, such as the Danish one that follows the activities at the "parliament and Dinamarca," and processes the formulation of laws so that people might know exactly the facts and which parliament members are involved. The Danish site (Eficiencia Energética en Dinamarca (2016) helps to find new methods to improve home energy efficiency, including financial planning and information regarding contractors that might do this work. It is based on cadastral information, Government subsidies, and commerce local registries. The most important organizations that collaborate on the development and implementation of open data they highlight are Open Data Development, the World Bank, and ILDA. According to ILDA, Latin America is one of the most active worldwide regions regarding open data nowadays. An active group of Government and civil leaders have consolidated communities in the regional events (Abrelatam and Condatos, 2016). There is a great liberation and use of public data in various countries. The public data remains a pillar of success for the legislation and infrastructure of any country. A big part of civil society organizations is to take the data regarding their respective contexts and convert them into civic actions to improve institutions and public services and generate new participation forms. New Government leaders make connections with civil society for new collaborations, and the private sector offers key services to develop the infrastructure that is required for these forms of work. Gradually, Latin America has today achieved the potential of taking the open data agenda to another level by focusing on the use of open data in the context of the proper priorities for regional development. For example, Chile has the Law of Access to the Public Information, Law of Associations, and Citizen Participation; this information has been taken from the website (Gobierno Abierto en Argentina 2016). In El Salvador, the Government websites contain tools to ask for public information, send complaints, receive notifications and consultation, read publications, and download socially useful information (Gobierno Abierto en Chile 2016). In Paraguay, there is a Law of Access to the Public Information and an Institute for Access to the Public Information; this can be read on the website of the Government of Paraguay (Gobierno Abierto en el Salvador 2016). Likewise, Argentina has an Open Government website, and in Mexico, Agroclima (Agroclima México 2016) permits access to information regarding the weather forecasts and possible impacts of climate changes on agriculture and livestock. In Venezuela, there is not a website for centralized open data information. However, a Facebook account exists to gather interested actors. The website of the Instituto Nacional de Meteorología e Hidrología (INAMEH) provides a site with partial open data; it is available on the website of Meteorology from the Venezuelan Air Force Army. In this research work, an exploratory study has been conducted to investigate the existence of efforts for open data and its dependencies on the public sector using surveys before the technical study. Regarding its implementation, some solutions exist based on cloud computing providers such as Amazon Web Services and others on national data centers. Several organizations have recommended some steps for implementation of open data (Global Open Data Initiative 2016).

## Unified Theory of Acceptance and Use of Technology (UTAUT) Model

UTAUT is a technology acceptance model formulated to correlate the attitude of acceptation and its use with the performance expectancy, effort expectancy, social influence, and facilitating conditions. It can be used to study the attitude of ICT directors in relation to open data in the following sense:

1. ***Performance expectancy:*** It is the degree to which an individual believes that using an open data system will help in their work. It could be moderately influenced by gender and age.
2. ***Effort expectancy:*** It is the degree of ease associated with the use of an open data system. Some authors have found that it is more evident in women, particularly older women with less experience.

3. ***Social influence:*** It is the degree to which an individual perceives how important others believe the open data system will be. The author of the UTAUT model expects a complex interaction between influence and intention.
4. ***Facilitating conditions:*** It is the degree to which an individual believes that a technical and organizational infrastructure exists to support the system. Experience and age moderate this factor.

The voluntariness of use is not considered in the original UTAUT model. However, it has been included in later research for the implantation of worldwide open data. This study was done with surveys: physically and electronically with a group of researcher, assistants, and open data conferences from various countries. In the simpler form, it has been analyzed that 45% of the variability of behavior related to the intention of implanting open data depends on these factors. Facilitating conditions has the least influence.

## Administrative Model for Implanting Open Data and Technical Steps

### Administrative Model

The administrative model consists of a hierarchical representation based on the layers of the elements that are considered on the implantation of open data in a region, country, or place. It has some similarities with a balanced scorecard used for management control and permits the establishment of guidelines. Lower layers are often related to the legal and operations aspects. Upper layers are related to the strategies. Some regional models exists in Latin America such as the Modelo de Madurez Open Data OD-MM created under the framework of the Project "The citizen and e-government for the Americas" from Colegio de las Americas (COLAM). This model of implantation was used in Colombia and has been proposed as the guidelines for Venezuela. Four layers are proposed from bottom to the top: support, operation, tactic, and strategy. The support layer is related to the legal framework, processes, technology, and organizational environment. The operation layer defines one value chain between the offer of open data and demand with continuous feedback. The tactic layer involves institutional articulation and public politics. Finally, the strategy layer defines the objectives of open data and their alignment with E-Governance strategies.

### Technical Steps for Implanting Open Data

Some portals propose a group of steps to implement open data. Socrata, one of the available platforms, suggests the following six steps.

1. **Start small:** decide which datasets to publish first. It is similar to the philosophy of Lean Startup (El Método LEAN STARTUP 2017). A cycle must be used: create–measure–learn; it is necessary to have the feedback of citizens. Files can be converted into diverse formats: JSON (JavaScript Object Notation), CSV (Comma Separated Values), XML (eXtensible markup language).
2. **Get transparency done:** the easiest data to publish first is usually financial transparency and personnel data. It is recommended to show visualizations, especially charts.
3. **Bring developers on board:** the primary goal is to connect with the local developer community and help them build applications. Many organizations, institutes, and governments use Creative Commons licenses to share data just to maximize the re-use of data and databases.
4. **Increase Agency Participation:** the open data program needs to obtain participation from agencies and departments. Personnel also needs to be trained and can study the case of other government organizations.
5. **Optimize for efficiencies and cost savings:** this is the moment to decide whether to adopt new technologies that make the flow of data and information more efficient. Collaborative information is important to compare how easily colleagues have found data.
6. **Federate data with neighboring, cities, counties, and states:** the implementation plan so far has been focused on internal walls mainly and experience of employees. A two-way exchange of data is needed with

neighboring cities, counties, states, federal agencies, and stakeholders to create converged data portals at regional and national levels. This is called a "data catalog federation."

## Methodology

A qualitative research transversal exploratory document based on a bibliography and two levels of survey was administered to a number of ICT experts from the public sector in Venezuela.

(A) Collecting open data experiences worldwide outside Venezuela:

Different experiences regarding open data outside Venezuela have been investigated by consulting several websites such as the Open Data Barometer. Some articles and conference proceedings were also considered (Bertot et al. 2010; Cotino 2013).

(B) Administration of first level surveys to 20 Venezuelan ICT experts responsible for public institutions:

It was distributed through an electronic survey using Google Forms where personal information was asked: complete name, career, years of experience, and name of organization. After that, some questions about the actual state of open data in Venezuela were asked. The survey was based on the UTAUT model.

(C) Elaboration of guidelines for the implantation of open data in Venezuela:

After the analysis of the first level survey, guidelines were established in the following order:

(i) Definition of an open data implantation model that contains objectives, strategies, tactics, operation, and support elements. The results of the survey from the 20 experts was considered.

(ii) Definition of operative elements with a virtual value chain related to the offer and demand of open data. At the level of offer, the components identified were preparation of aperture, identification and treatment of data, and promotion with supervision. At the level of demand, the components identified were needs and requirements, access to public data, and development and registration of applications.

(iii) Establishment of responsible actors, the tools, and guidelines for each component.

(D) Application of second level surveys to three higher-level ICT directors of public dependencies in Venezuela for validation of guidelines:

Once the administrative guidelines were designed, three national experts consulted to validate them:

- *Vice minister of Electrical Energy of Venezuela:* professor of ICTs from Universidad Central de Venezuela. Founder of CENDIT (Fundación Centro Nacional de Desarrollo e Investigación en Telecomunicaciones).
- *Director of Ministry of the Popular Power for University Education, Science and Technology:* is in charge of design and application of public politics related to ICT.
- *Director of ICTs at Universidad Central de Venezuela:* is the person responsible for coordinating and developing new methods to use ICTs for activities related to teaching, research, and extension.

After the qualitative research. A technical study was conducted using the following method:

(A) **Searching diverse sources:**

Use of Internet, books, and papers to search regarding the technologies that are used for the deployment of open data in Venezuela.

(B) **Information about cloud computing:**

Decide which modality of services (software such as a Service-SaaS, platform such as a Service-PaaS or infrastructure such as a Service-IaaS) are to be chosen for open data depending on the CSPs.

(C) **Search of technical steps:**
Decide which steps are recommended for its implantation according to diverse experiences from other countries.

(D) **Comparison between open data based on cloud computing providers (CSP) versus use of national data centers**:
Consider the global tendencies and the specific characteristics of the Venezuelan reality.

## Results and Proposal

### Administrative Study

After applying the first questionnaire to the group of 20 ICT expert directors or the equivalent from the public sector, we obtained the following results:

**Question 1: Is Open Data Philosophy Known by your Institution?**
Table 1 shows that 16 out of 20 surveyed directors know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 2: Is There any Open Data Project in your Institution?**
Table 2 shows that 4 out of 20 surveyed directors have open data projects in their institutions and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Digital Transparency and Open Data, Table 1** Response to question 1

| Response | Frequency |
|---|---|
| Yes | 16 |
| No | 4 |
| *No answer* | *0* |

**Digital Transparency and Open Data, Table 2** Response to question 2

| Response | Frequency |
|---|---|
| Yes | 4 |
| No | 12 |
| *No answer* | *4* |

**Question 3: What type of Information Might or Has Been Included in any Open Data Project for your Institution?**
Table 3 shows that 3 out of 20 surveyed directors have included budget, infogovernment, and pension/retirement in open data projects and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 4.1: Why Not (There Is Not an Open Data Project in your Institution)?**
Table 4 shows that 10 out of 20 surveyed directors know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 4.2: Is your Institution Willing to Implement the Open Data Philosophy?**
Table 5 shows that 9 out of 20 surveyed directors were willing to implement open data in their institutions and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Digital Transparency and Open Data, Table 3** Response to question 3

| Response | Frequency |
|---|---|
| Budget | 1 |
| Infogovernment | 1 |
| Pension/retirement | 1 |
| *No answer* | *17* |

**Digital Transparency and Open Data, Table 4** Response to question 4.1

| Response | Frequency |
|---|---|
| No resources | 2 |
| Other projects | 3 |
| No interest | 1 |
| Complexity | 1 |

| *No answer* | *8* |

**Digital Transparency and Open Data, Table 5** Response to question 4.2

| Response | Frequency |
|---|---|
| Yes | 9 |
| No | 2 |
| *No answer* | *9* |

**Digital Transparency and Open Data, Table 6** Response to question 5

| Response | Frequency |
|---|---|
| Transparency | 12 |
| Accountability | 11 |
| Info for private sector | 6 |
| *No answer* | *1* |

**Digital Transparency and Open Data, Table 7** Response to question 6

| Response | Frequency |
|---|---|
| Yes | 18 |
| No | 1 |
| *No answer* | *1* |

**Question 5: The Open Data Philosophy Would Be Implemented in your Institution to Provide (Options: Transparency, Accountability, Information for Private Sector, Other)?**
Table 6 shows that 19 out of 20 surveyed directors agreed over open data constraints and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 6: Does your Institution Have a Staff that Can Be Trained on Open Data?**
Table 7 shows that 18 out of 20 surveyed directors have staff in their institutions to train for open data and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 7: Would your Institution Be Willing to Hire an External Enterprise for Training your Staff on Open Data?**
Table 8 shows that 8 out of 20 surveyed directors were willing to hire external services for open data and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Digital Transparency and Open Data, Table 8** Response to question 7

| Response | Frequency |
|---|---|
| Yes | 8 |
| No | 9 |
| *No answer* | *3* |

**Digital Transparency and Open Data, Table 9** Response to question 8

| Response | Frequency |
|---|---|
| Yes | 19 |
| No | 0 |
| *No answer* | *1* |

**Question 8: Do you Think that Implementation of Open Data in your Organization Would Permit Access to Information Activities Work with Better Performance?**
Table 9 shows that 19 out of 20 surveyed directors agreed that implementation of open data improves the performance and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 9: Do you Think that Implementation of Open Data in your Institution is too Much Effort?**
Table 10 shows that 12 out of 20 surveyed directors agreed that it does not take much effort to implement open data and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 10: Do you Think that Other Institutions of the Public Sector Might Be Willing to Implement Open Data?**
Table 11 shows that 18 out of 20 surveyed directors gave their thoughts regarding the willingness of open data for public sectors and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Digital Transparency and Open Data, Table 10** Response to question 9

| Response | Frequency |
|---|---|
| Yes | 6 |
| No | 12 |
| *No answer* | *2* |

**Digital Transparency and Open Data, Table 11** Response to question 10

| Response | Frequency |
|---|---|
| Yes | 18 |

**Digital Transparency and Open Data, Table 12** Response to question 11

| Response | Frequency |
|---|---|
| Yes | 8 |
| No | 11 |
| *No answer* | *1* |

**Question 11: Is the Network Infrastructure of your Institution Prepared to Permit the Implementation of Open Data?**
Table 12 shows that 8 out of 20 surveyed directors agreed that their institutions have sufficient infrastructure for implementation of open data and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

**Question 12: Has any Member of your Institution Ever Volunteered to Participate in an Open Data Project?**
Table 13 shows that 8 out of 20 surveyed directors show a willingness to adopt open data and know of the open data philosophy. The questionnaire included a small paragraph explaining the concept of open data.

## Technical Study

According to the state of the art, the use of cloud computing provides many benefits compared with

**Digital Transparency and Open Data, Table 13** Response to question 12

| Response | Frequency |
|---|---|
| Yes | 8 |
| No | 12 |
| *No answer* | *0* |

**Digital Transparency and Open Data, Table 14** Comparison of CSP versus other

| Characteristic | CSPs | Other |
|---|---|---|
| Costs | Low | High |
| Time to market | Short | Large |
| New technology | Fast adoption | Slow adoption |
| Interoperability | Complete | Difficult |
| On-demand-service | Elasticity | Inertia |
| QoS guaranteed offer | SLA | Non-guaranteed |
| Autonomous system | Transparent | Decentralized |
| *Scalability* | *Complete* | *Non enough* |

national data centers managed by public sector employees and other paradigms such as grid computing (Shawish and Salama 2017), including the advantages related to costs and value. In Venezuela, there are some CSPs such as NETELIP, NUBOTEK, IBM, HP, and Microsoft. They do not have the necessary experience with open data in Venezuela and are only oriented toward the private sector with the modality Software as a Service (SaaS). The implementation of open data requires CSPs to provide Infrastructure as a Service (IaaS) because APIs can be used. CSPs are mainly used by telecommunications companies and banks. Regarding open data, the cost of implementation with CSPs is lower than with other solutions such as national data centers. The time to market is shorter with cloud computing, and thus if open data solutions based on IaaS are offered by any cloud computing company the service can be delivered quickly. New technologies can also be quickly adopted by CSPs because these enterprises are focused on the newest advances. Interoperability is also an issue considered by CSPs. They offer the characteristic of elasticity since open data datasets will be increased in a structured form. A service level agreement (SLA) must be established between the CSPs and the government to assure a quality

of service. Table 14 presents the justification summary of when it would be necessary to use CSPs for implementing open data instead of other solutions.

## Proposal of Guidelines for Implanting Open Data in Venezuela

Initially, the results from the first level survey were collected. Furthermore, some elements were identified to be considered for the implementation of open data in Venezuela using a tentative model of implantation. The questionnaire collected the attitude of the 20 ICT experts responsible for public Venezuelan dependencies. To establish the guidelines and recommendations from international organizations that promote the use of open data, considering the most successful experiences worldwide based on best practices, key sources were consulted from the European Union and USA. Such sources are: Study of the impact of reuse or resources of open data in the European Union (European Data Portal 2017), the report of best practices of open data in the Canarias Islands, and the guide of open data for the Department of Police of Philadelphia in the USA established by the Chief Officer of Data presented in the Code For America (2017). Using all the information collected from the documental research and surveys from the 20 ICT experts from the public sector, a specific model for Venezuela has been proposed (Fig. 1). The guidelines originate from this model. This model might be consistent with the model used in Colombia resulting from Presidential Directive No2 and Decret 1151 in 2000 that permitted its implementation in 2010–2014 by following the development plan.

### Guidelines for the Offer of Open Data

This section proposes the overall guidelines of the open data adaption for opening, identification, analysis, prioritization, documentation, uploading, and publication.

#### Preparation for Opening

In Tables 15, 16, 17, and 18, guidelines for opening are proposed. The E-Governance system must permit including any project, and thus it must be formed by a multidisciplinary team, a working plan needs to be defined, and participants must be trained.

**Digital Transparency and Open Data, Table 15** Response to question 9

| | Interest of participating |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Guide for opening |
| *Guidelines* | *Creation of a main website for open data* |

**Digital Transparency and Open Data, Fig. 1** Model for implementation of open data for Venezuela

**Digital Transparency and Open Data, Table 16** Response to question 9

| | Formation of working group |
|---|---|
| Actors | Universities, research centers, private sector |

|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Guides, face-to-face and virtual training |
| *Guidelines* | *Accessible face-to-face or virtual training* |

**Digital Transparency and Open Data, Table 19** Response to question 9

| | Identification |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Data guide and website e-government |
| *Guidelines* | *Actors must identify and define datasets in catalog* |

**Digital Transparency and Open Data, Table 20** Response to question 9

| | Analysis of information |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Data guide and website e-government |
| *Guidelines* | *Responsible actors must identify publishable data in accordance with the law* |

## Identification, Analysis, Prioritization, Documentation, Uploading, and Publication

In Tables 19, 20, 21, 22, and 23, guidelines for treatment and publication for open data are proposed. Interests must be identified and analyzed to see which ones are publishable. The datasets must then be prioritized, uploaded, and published.

**Digital Transparency and Open Data, Table 21** Response to question 9

| | Prioritization of information |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Data guide and website e-government |
| *Guidelines* | *Responsible actors must prioritize publishable data* |

**Digital Transparency and Open Data, Table 22** Response to question 9

| | Documentation |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Data guide and website e-government |
| *Guidelines* | *Actors are responsible for understandable data documentation* |

**Digital Transparency and Open Data, Table 23** Response to question 9

| | Uploading and publication |
|---|---|
| Actors | Universities, research centers, private sector |
| Tools | Data guide and website e-government |
| *Guidelines* | *Actors are responsible for structuration of data with open formats* |

**Digital Transparency and Open Data, Table 24** Response to question 9

| | Promotion of data |
|---|---|
| Actors | Venezuelan state |
| Tools | Communication plan of the dependency |
| *Guidelines* | *The state is responsible for promoting datasets* |

### Promotion and Follow-up

In Tables 24 and 25, guidelines were proposed so that the state promotes and updates published datasets.

## Guidelines for the Demand of Open Data

This section proposes the overall guidelines of the open data adaption for demand and development of applications.

### Identification of the Demand

In Tables 26 and 27, guidelines for identification of users and required studies are proposed. A market study is necessary.

### Access to Public Data

In Tables 28 and 29, guidelines for searching, downloading, and notification of datasets are proposed. There must be a catalog.

**Digital Transparency and Open Data, Table 25** Response to question 9

| | Updating of data |
|---|---|
| Actors | Venezuelan state |
| Tools | Communication plan of the dependency |
| *Guidelines* | *The state is responsible for updating datasets* |

**Digital Transparency and Open Data, Table 26** Response to question 9

| | Identification of data users |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Users database |
| *Guidelines* | *Website must register users and update periodically* |

**Digital Transparency and Open Data, Table 27** Response to question 9

| | Study of needs for the demand |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Market study |
| *Guidelines* | *Different actors must do market studies to identify interests, use, and needs* |

### Development of Application

In Tables 30 and 31, guidelines for the development and registration of applications are proposed. The applications must be based on open source and must comply with the national regulations. Once verified, they can be registered on the application store.

**Digital Transparency and Open Data, Table 28** Response to question 9

| | Search and download of open data |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Open data catalog |
| *Guidelines* | *Developers give products to providers. No restriction for users* |

**Digital Transparency and Open Data, Table 29** Response to question 9

| | Notification of published data |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Open data catalog |
| *Guidelines* | *Catalog must enable notifications for each type of users* |

**Digital Transparency and Open Data, Table 30** Response to question 9

| | Development of applications |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Any IDE (integrated development environment) |
| *Guidelines* | *Development of applications must be done by using open standards and open source* |

**Digital Transparency and Open Data, Table 31** Response to question 9

| | Registration and applications |
|---|---|
| Actors | Citizens, guilds, NGOs, developers, academy, state |
| Tools | Applications store (open source) |
| *Guidelines* | *Developer must register the application. The functioning and data validity must be verified* |

## Conclusions and Perspectives

The philosophy of open data has not been implemented in all public dependencies of Venezuela. This is probably because there are no formal guidelines due to a lack of planning in this area. However, the legal framework has been progressively established since the creation of the Law of Infogovernment. Specific legislation for open data might be implemented by using regional models such as the Open Data Maturity Model for the Americas. Guidelines from the European Union and Organization of American State (OAS) might accelerate the process. The model of implantation for Venezuela could include training for change management at the lowest layers. The UTAUT model for acquisition of technology for open data may help to more thoroughly study the attitude of ICT directors in public administration dependencies. According to a preliminary study, some directors think that now is the time for implantation. It is recommended to do a more detailed study of all public organizations of Venezuela to see if the National Technological platform is adequately prepared to connect the cloud to the public administration networks. Internet providers could also make it easy to download open data applications by applying quality of service to the correspondent flows.

### Conflict of Interest

Author declares that they have no conflict of interest regarding publication of this paper.

## Disability Bioethics: Ethical Problems in Genetic Testing in the USA

Andjela H. Kaur
University of North Dakota, Grand Forks, ND, USA

### Synonyms

Disability and bioethics

### Definition

Disability bioethics is the study of ethical reasoning and ethical professional practice at the intersection of ethics, biomedical science, and disability studies. Disability bioethics draws on the philosophical discipline of ethics and its applications in the practice of medicine, as well as on disability studies and disability activism. Public health administration and policy play an important role in the assessment of genetic testing from the standpoint of disability bioethics.

### Introduction

As a philosophical discipline, bioethics seeks to answer ethical questions in biomedical science and the professional practice of medicine. General ethicists may seek answers to questions such as: How should people act?; What norms and principles should guide human conduct?; How does one distinguish between right and wrong?; and What does it mean to be a virtuous person? Bioethicists, focusing on the intersection of ethics with the practice of medicine and health professions, may ask: Is genetic engineering good for humanity?; Is euthanasia morally permissible?; What are the doctors' and nurses' obligations towards their patients?; and What does it mean to treat patients equally and fairly?

To elucidate such questions in the context of disability, disability bioethicists may ask: Should civil and human rights be upheld for persons with disabilities seeking medical treatment?; Is physician-assisted suicide morally permissible?; Should patients with disabilities be afforded the same treatment options offered to patients without disabilities?; and What are doctors' and nurses' moral obligations towards patients with disabilities?

To answer such questions, disability bioethics relies on the knowledge provided by biomedical science, on the guidance provided in professional codes of ethical conduct for medical staff, and on the literature in medical bioethics including its legal aspects. Additionally, it relies on the insights of historians and philosophers of disability, on disability art and disability culture, as well as on the empirical research on the experience of living with disability and personal testimonies of persons with disabilities. Lastly and crucially, disability bioethics engages the knowledge provided by disability studies and disability social movements (e.g., disability rights movement, disability justice movement, and independent living movement). It takes into account testimonies of disability activists who seek to expose and dismantle the prejudice and structural injustice towards disabled people in the context of biomedical research and the practice of medicine (Longmore 1995; Parens and Asch 1999; Amundson 2008; Asch 2001; Scully 2008a; Ouellette 2011; National Council on Disability 2019).

As a multidisciplinary endeavor, disability bioethics is informed by the ethical principles, professional virtues, and socio-political values that structure the diverse sources of knowledge on which it draws. These diverse influences are reflected in the ways disability bioethics addresses

challenging ethical questions and complex situations in biomedical practice. One of the common complex topics in disability bioethics is genetic testing (Scully 2008a).

Public health ethics aims to identify common good related to human health and to administer activities that would lead to the fulfillment of those goals. Public health activities are grounded in general moral considerations (examples of which are noted above) presumed to concern the majority of humans and in specific moral questions that arise in the context of a specific population. By contrast from general ethics, public health ethics is concerned with ethical problems related to health; in distinction from bioethics, it seeks primarily ethically to satisfy the needs of a population, rather than those of an individual (Holland 2015). As disabled people can be considered a specific population, public health ethics and disability bioethics share a vantage point when they consider questions concerning the group. Their goals can diverge substantially, however: while public health ethics guides public health activities towards the goal of improving the health and well-being of a community or society through eradication of medical abnormalities, disability bioethics seeks to improve the well-being of all people by including medical imperfections into the definition of a healthy and well society. In its ethical problematization of genetic testing, disability bioethics makes clear this difference in approach and highlights the value of the population-based approach to bringing about collective health and well-being.

This review of major issues in disability bioethics in the context of routinization of genetic testing draws attention to the need for collaboration between disability, medical, and public health ethics. By highlighting the central concerns of disability bioethicists, disability advocates, and persons with disabilities, the review invites mainstream bioethics to engage with the perspectives of those who are directly affected by the ethical deliberations and decisions in the field of biomedicine. The review begins with an introduction of the relevant concepts, namely genetic testing, routinization, and informed consent. Next, it turns to the analysis of these terms and practices in the context of disability bioethics, which includes the examination of emotional harm, epistemic injustice, and social and legal discrimination. The conclusion invites the bioethicists to consider disability as a form of biological and social diversity.

## Genetic Testing

Continuous development of biomedical technologies has made genetic testing more readily available to the general population (Andrews 1996; Suter 2002). Today, people can undergo genetic testing for a variety of reasons and at different stages of their lives. Genetic tests can broadly be divided into three categories: predictive, carrier, and diagnostic. The first two types of tests are often associated with family planning, and the third may be used for the purpose of family planning as well as a diagnostic tool at any stage of life. Carrier tests are used to identify if a person has a genetic mutation which is likely to become symptomatic in their lifetime, or which may, under certain circumstances, cause a genetic disorder in their children. Predictive genetic tests are conducted during pregnancy in order to screen for the presence of a genetic anomaly in a fetus. Diagnostic testing is used to identify a genetic disorder in a fetus, a child, or an adult (Andrews 1996; Suter 2002).

Regardless of the type of test it uses or the genetic condition it tests for, the practice of genetic testing raises ethical concerns for disability bioethics. Some questions that arise in this context are: Should genetic testing be routinely recommended by physicians?; Should medical staff recommend selective abortions based on the disability status of the fetus?; What information should be presented to inform personal decisions in case of a positive test result?; and Should patients receive nonmedical information about the social, psychological, and cultural experiences of disabled people? To answer such questions, disability bioethicists organize their arguments around two central topics: routinization of genetic testing and informed consent.

### Routinization

Routinization is common in public health administration. Routine medical interventions may be mandated by health policy (e.g., selected vaccinations) or may be routinely recommended to patients by their medical providers. Accordingly, the term "routinization" of genetic testing refers to the promotion of genetic testing as a component of routine health care. The promotion may take the following forms: (a) offering carrier testing to patients who may or may not have a family history of a serious medical condition; (b) communicating spoken and unspoken expectations to pregnant women about including predictive genetic tests in the standardized battery of blood or sonogram pregnancy tests; and (c) recommending diagnostic genetic testing as a necessary next step in the case of a positive genetic screening test (Andrews 1996). In addition to the promotion of genetic testing, routinization also includes measures that overtly or covertly prohibit or discourage patients from refusing genetic testing. These measures may include public health policy mandates requiring testing for specific groups of people and for specific disorders, circumventing conversations about the risks and inaccuracies of genetic tests, and avoiding discussions about the patients' right to refuse medical intervention.

Routinization of genetic testing can also be contributed to the factors outside of public health policy and health-care management. As the producers of genetic tests have a vested interest in the sales of their product, promotion of genetic testing is also connected to the financial goals of the biomedical industry. Prior to the invention of noninvasive genetic testing (NIPT), commercial producers of genetic tests were mostly operating in close cooperation with the medical providers and under the direction of governmental agencies (e.g., Food and Drug Administration). Under these conditions, genetic testing was considered an invasive procedure and genetic screens were routinely offered only to known carriers and women considered to have a medically justifiable risk of a chromosomal anomaly. But, since the large-scale production of NIPT became technologically possible in 2011, an array of noninvasive tests has been marketed more aggressively as desirable health-care commodities. Between 2011 and 2019, the number of companies offering NIPT in the USA rose from 4 to 40, and the global revenue for the genetic testing industry is projected to be over $2.5 billion by 2025 (National Council on Disability 2019). Remarkably, these business venues have been marketing the tests to all those interested to know, regardless of their medical history and risk factors associated with chromosomal abnormalities.

Rapid routinization of genetic testing has caused an unprecedented challenge to public health administrators. Across the globe, public health ethicists and policymakers are asking questions, such as: Should the testing be available to all interested parties?; Should national insurance programs and governments pay for the tests or subsidize their cost?; Should the marketing of the tests be regulated by public health laws and policies?; and What, if any, limitations should public health policies impose on genetic testing? In the USA, additional questions emerge as both the number of companies producing the commodity and the number of disorders the tests can detect are rapidly increasing, despite the high frequency of intellectual property litigation regarding testing patents (Agarwal et al. 2013).

### Informed Consent

Some medical interventions are compulsory as a matter of health policy, but most medical interventions require patients' consent as a matter of professional ethics of health-care providers. The term "informed consent" refers both to the act through which a patient agrees to a specific medical intervention and to the doctor–patient conversation preceding such authorization. Informed consent takes as its premise the belief that patients have the right to direct their medical care. Thus, it is both an ethical and a legal obligation of medical practitioners in the USA to obtain patients' consent prior to commencing medical interventions in nonemergency situations. In other words, because patients have the right to receive the information they need to make an informed decision about their care, the medical care provider has the obligation to supply that information.

Despite a vast variety of recommendations about collection procedures and the content of the information that should be shared during informed consent deliberations, disability bioethicists agree that: (a) the decision-maker should be a person capable of making the decision on their own or through a supported decision-making process; (b) the decision should be made freely, without persuasion or coercion; (c) the decision-maker should communicate an understanding of the information shared verbally or through alternative means of communication; and (d) the medical staff should provide enough information for the decision-maker to make an informed choice (Longmore 1995; Asch 2001).

The following three standards, expressed as guiding questions, may be used to assess the adequacy of information shared in the informed consent process: (a) subjective standard: What would this patient need to know and understand to make an informed decision?; (b) reasonable patient standard: What would the average patient need to know to be an informed participant in the decision?; and (c) reasonable physician standard: What would a typical physician say about this procedure? Although the courts prefer the use of the second standard, it is the providers who have the obligation to determine which standard best applies in a given situation (Andrews 1996).

Further, a legal doctrine of informed consent compels the doctors to inform the patient of the following: (a) the diagnosis; (b) nature of the proposed medical intervention; (c) anticipated outcomes; (d) risks and benefits of alternative treatments; (e) serious possible risk and complications, as well as benefits of the proposed intervention; (f) risks and benefits associated with refusing the intervention; (g) possible known effects of the intervention on the particular patient (personalized information); and (h) physicians' personal or economic interests that may influence their recommendation, if any.

In the context of health-care systems, informed consent forms serve as administrative documentation and evidence of compliance. In practice, in a busy work environment for a routinized medical intervention, the complex process of informed decision-making may get reduced to an act of autographing a prepared statement written by a compliance office (Hall et al. 2012).

In sum, routinization of genetic testing is a multifaceted process driven by the priorities of scientific and technological innovation. As rapid technological development, public health policy, and commercial interests converge, ethicists from a variety of disciplines raise questions about routinization as a means for dissemination and application of scientific and technological advancements. Informed consent is a process through which a patient agrees to undergo a medical intervention that the doctor proposes. This process is guided by both ethical considerations and legal acts. Bioethicists and policymakers agree that information sharing is central to informed consent procedures, but there is not enough clarity about what information should be included in joint decision-making in this context.

## Disability Bioethics Analysis of Routinization and Informed Consent in Genetic Testing

Disability bioethics shows how routinization and informed consent affect lives of those living with disabilities and how availability of medical procedures influences conceptualization of disability in medicine and health care. The notions of disability created in medical settings and through the processes of administering medical procedures often influence public views on disability more broadly. Disability bioethicists' analyses of these processes reflect the multidisciplinary character of disability bioethics and the complexities intrinsic to definitions of disability. Direction for their inquiries comes from their own personal experiences, social science research, legal scholarship, and the work of disability historians, artists, and philosophers. Ethical issues that arise in consideration of all these perspectives, at the intersection of disability and routinization and informed consent in genetic testing, can be grouped in three broad categories: (a) emotional risk or harm, (b) epistemic injustice, and (c) social and legal discrimination.

### Emotional Harm

Emotional risk or harm occurs when a patient is given knowledge of a problem related to their well-being for which there is assumed to be no solution. For example, when a carrier learns that they have a high chance of becoming ill with an incurable disease, they have been exposed to knowledge about their future which they cannot change. When carrier testing is routinized, the likelihood increases of emotional risk and harm to a greater number of patients. According to the study of over one hundred women who had taken a noninvasive genetic test (only blood samples were used), all women experienced anxiety during the screening process (Farrell et al. 2016). Although such routine testing may cause greater harm on aggregate, it is possible to justify this enlarged exposure by honoring each patient's individual right to know and their right to choose what they wish to know.

To honor the patient's autonomy, a medical expert should facilitate a conversation with the patient about the risk of emotional harm in knowing or predicting one's future. Physicians and genetic counselors often neglect to discuss the risk of emotional harm when obtaining informed consent to genetic testing. When they do discuss the risk of emotional harm, medical staff routinely misrepresent such risk caused by new knowledge as the better alternative to the problem posed by undetected disability presumed to be a tragedy (Longmore 1995; Andrews 1996; National Council on Disability 2019). In other words, instead of discussing the reasons for which one might ponder whether they should take the risk of knowing their future, medical professionals foreground the threat of disability as the central emotional risk one would take if they consented to genetic testing. Such misrepresentation of the ethical dilemma at hand heightens the patient's fear and anxiety about their future because their desire to learn their chromosomal count is taken for the desire to know their misfortune. At the same time, disability is presented to the patient as tragic by definition, the only possible negative outcome of their procreative potential, in disregard of the fact that tragedies happen for a variety of reasons and at any point in peoples' lives and regardless of their genetic makeup.

Most importantly, disability in these discussions figures solely as a mark of a negative personal experience, and, more broadly, as a form of human existence deserving of systematic eradication. The former conception is at odds with the experiences of disabled people who repeatedly report that their lives are indeed satisfying (National Council on Disability 2019). The latter disregards the fact that eliminating a pregnancy does not eliminate the presence of disability in the world. Consequently, disability bioethicists recommend that informed consent discussions be focused on the issue at hand, namely, the risks and benefits of knowing what the future may bring to the person in question in their particular circumstances. These conversations then ought to include the accurate information about experiences of persons who live with the specific disability detected or confirmed by the test, and be provided by persons with disabilities and/or their caretakers (Andrews 1996; Parens and Asch 1999; National Council on Disability 2019).

It is important to consider how the emotional harm caused by routinization and flawed informed consent affects persons with disabilities as well. As the disability movement suggests in its "expressionist argument," routinization of prenatal testing expresses a strong message to the potential parents and to the public to select against disabling traits, which in turn hurts people who already live with those same traits (Parens and Asch 1999).

### Epistemic Injustice

Epistemic injustice is a discriminatory practice which excludes certain individuals or groups of people from the processes of creation and dissemination of knowledge based on identity prejudice against them (Fricker 2009). In the context of routinization and informed consent, epistemic injustice occurs wherever the common and wrongful assumption is made that patients will and should unconditionally agree to the tests instituted by medical science and recommended by their doctors. This assumption is shared by medical staff and patients, and is institutionalized through hospital policies, promotional materials

about genetic testing, and, more generally, by advertisements about genetic testing as a routine practice in health care. Due to such uncritical circulation of views on health and well-being that privilege biomedical sciences as the authoritative model of knowledge, patients are forced to accept this epistemic perspective as the only, and, thus, the "true" knowledge (Newell 2006). This epistemic vacuum wrongs the patients by restricting their knowledge base and presuming the patient to be a nonknower. Once presumed to lack the capacity to know, the patients are not given all the information they need in order to understand the context of the intervention to which they are required to consent, and are so subjected to routines they cannot change and to which they cannot object.

Epistemic injustice also marks the systematic exclusion of information provided by persons with disabilities, disability scholars, and disability activists from the promotional materials for the medical procedures and from the medical decision-making processes. This exclusion positions disabled people as noninformants in the production of knowledge about genetic testing and disability. Through such selective sharing of knowledge, medical professionals construct biomedical science as the one reliable source of knowledge, and disability community as an undependable one. Consequently, routinization and flawed informed consent create the epistemic space in medical practice in which patients and disabled people are taken to be either ignorant or incapable of knowing, while the medical professionals and institutions figure as indisputable epistemic authorities.

### Social and Legal Discrimination

Routinization and flawed informed consent procedures create the conditions for discriminatory use of biomedical science in social contexts (Scully 2008b; Parens and Asch 1999; Asch 2001). Social and legal discrimination in this context happen in two ways: through social and legal acts disfavoring disability and through disregard for the existing social practices and legal protections upholding disability as a form of human biological and social diversity. The history of use of social and legal acts to prevent and eliminate disability as a form of life has included the following: (a) institutionalization of children and adults with disabilities; (b) forced sterilization of persons identified as disabled; and (c) scientific experimentation on institutionalized and imprisoned disabled people. Although most of these practices are not legally permitted or enforced any longer, contemporary disability bioethics continues to grapple with the remnants of the historical practices and ethical norms rooted in eugenics – a discriminatory application of genetics to the social sphere of life.

For instance, while there are currently no federal laws in the USA requiring genetic testing, most states do legally mandate routine newborn genetic testing. Although in most states these laws grant to parents the option to refuse the testing, routine newborn screenings are usually conducted in the name of improving public health outcomes (Andrews 1996). Thus, the providers can avoid engaging parents in an explicit discussion about their right to refuse the tests but rather assume the parents' consent. Some states include legal penalties for health-care workers who fail to conduct the tests, which additionally disincentivizes informed discussions about parental consent and dissent. Such presumptuous testing at the onset of a human's life as a social being communicates to the parents and the public that the division of people into healthy and unhealthy, and able and disabled, those who test negative or positive to a genetic screen, is necessary for the maintenance of social order, and a matter of great importance to their child's future and well-being.

Further contributing to the routine omission of legal mandates is the promotion of genetic testing by the epistemic authorities in health care and medical professions. Although these entities do not have the power legally to regulate the use of testing, they are widely presumed to be the authoritative sources of medical knowledge and their recommendations are publicized without qualification to both patients and medical staff. For example, the American College of Obstetricians and Gynecologists and the Society for Maternal Fetal Medicine recommend routine noninvasive prenatal testing (NIPT) of all pregnant women,

even if their health profiles contain no known risk of having a child with a disability. Consequently, since its commercialization in 2011, NIPT has been routinely recommended to pregnant women in the USA as a screening test for detection of genetic disorders, particularly those related to aneuploidy, the genetic mutations in the number of chromosomes. One of the most common forms of aneuploidy is Trisomy 21 or Down Syndrome (National Council on Disability 2019).

Due to the routinization of NIPT, the number of pregnant women who acquire the knowledge about the likelihood of having a child with Down Syndrome has increased relative to the number of women who consented to invasive tests prior to routinization of NIPT. The consequences of this increase are hard to measure quantitatively. The findings of studies of quantitative effects of NIPT routinization on the maternal decisions to terminate pregnancies due to positive test results vary vastly and are inconclusive in the aggregate (National Council on Disability 2019). These inquiries additionally substituted discussions of morality of abortion for question about the moral obligation to recognize the diversity of the embodied human experience. In other words, the question is not whether a mother should be allowed to abort upon the diagnosis of Trisomy 21, but whether Down Syndrome should be normalized as a permissible variant in the genetic makeup of the human race.

The qualitative examination of the consequences of routinization of genetic testing on human behavior and on the role it plays in the formation of dominant cultural attitudes and common social values shows the following: (a) routinization of genetic testing normalizes views of disability as a tragedy to be avoided at any cost; (b) selective abortion expresses negative or discriminatory attitudes not merely about a disabling trait, but about the people who carry it; (c) discriminatory attitudes towards disability are harmful to persons living with disability, and might negatively influence parental attitudes towards their own children with disability; and (d) commercialization of genetic testing promotes the view that the cost of health care for persons with disabilities should be assessed in relationship to the cost of a test used to determine if a human with a disability should be conceived or be born at all (Parens and Asch 1999; Asch 2001; Scully 2008b).

These problems could be solved in part by upholding the existing laws that seek to democratize routinization and informed consent. The Prenatally and Postnatally Diagnosed Conditions Awareness Act (PPDCAA 2008) is the most significant piece of federal legislation addressing disability rights and prenatal genetic testing. The law has the following goals: (a) to provide women who receive prenatal or postnatal diagnosis of Down Syndrome or other conditions with referrals to the providers of services related to the diagnosis as well as accurate information on the quality of life for individuals living with the diagnosed condition; (b) to strengthen networks of support among governmental agencies, patients, and provider programs; and (c) to ensure that patients receive evidence-based information on the accuracy of genetic tests (PPDCAA 2008). Notably, since its enactment in 2008, the PPDCAA has not received Congressional funding that would have been sufficient for its consistent enforcement. Many states have enacted similar laws, but their formulation of goals and mandated procedures vary widely, and their impact remains unclear (Andrews 1996).

Disability advocates agree, however, that even in the complete absence of legal directives, it is ethically imperative to share correct and comprehensive information about the accuracy of the test and about the quality of life of persons with disabilities (National Council on Disability 2019). At this time, neither consideration is part of routine discussions between medical personnel and patients before and after genetic testing. Academic research, popular media, and disability advocates show how information sharing in this context is often skewed in favor of exaggerating the accuracy of tests and diminishing the prognosis of a good life with a disability (Parens and Asch 1999; Asch 2001; Scully 2008a; National Council on Disability 2019).

Finally, promotional materials and advertisements about genetic testing do not mention that disabled people are protected by anti-

discrimination laws, namely the Rehabilitation Act and Americans with Disabilities Act; this fact is also routinely omitted from doctor–patient conversations about genetic testing. This exclusion may be justified by the language of these laws that do not currently protect unborn persons with disabilities, so carriers and parents could not be held legally responsible for disability discrimination against their unborn children. At the same time, there is no reason for excluding this information as a means of showing to the carriers and potential parents that their children would be legally recognized as rightful members of society. At a minimum, laws which protect disability as a form of human biological and social diversity should be mentioned along with recommendations for routine genetic testing issued by epistemic authorities in the field of medicine such as American College of Obstetricians and Gynecologists and the Society for Maternal Fetal Medicine. Although neither one of these professional organizations nor the anti-discrimination laws hold any legal power over the patients' decisions regarding genetic testing, they shape the ways patients and the public think about disability inclusion and exclusion.

## Conclusion

Disability bioethics problematizes routinization of medical procedures and notions of informed consent to procedures in ways that highlight the emotional risks, epistemic injustice, and social and legal discrimination in the context of genetic testing. Across these areas of concern, disability bioethics asserts that routinization of genetic testing perpetuates discrimination against disability as a form of human diversity and that informed consent fails to uphold ethical and legal mandates affirming disability as a variation of biodiversity. Disability bioethicists, thus, often recommend the following changes in practice: (a) genetic testing as a means to labeling disability as a tragedy should not be routinely recommended by physicians nor advertised as a part of routine health care; (b) patients should be given comprehensive information about the accuracy of genetic tests and the quality of life of persons with disabilities; and (c) medical staff in their daily use of biomedical research, and biomedical science more generally, should base testing recommendations and interpretations primarily on the nonmedical information provided by disability activists and disability scholars about the social, psychological, and cultural values intrinsic to a life experience of disability. Disability, thus, should be accepted as a form of biological and cultural diversity.

Comprehensive emergency management; Disaster management cycle; Nongovernmental organizations; Voluntary organization

### Definition

Disaster management.

### Introduction

Disaster management includes a complex set of activities which are carried out both in the pre- and post-disaster stage. Emergency management practitioners and scholars refer to these activities as the four phases of a comprehensive emergency management cycle, which include mitigation, preparedness, response, and recovery. Mitigation and preparedness are pre-disaster activities, while response and recovery constitute post-disaster activities (Clary 1985; Prater and Lindell 2000; Haddow et al. 2008). Each phase follows the previous, though its core functions persist even after its main activities are accomplished. For example, while working in a response phase, organizations might continue to encourage preparedness activities for communities, in order to reduce, at minimum, secondary impacts or encourage citizens to be better prepared in the future.

Public, private, and nonprofit (NP) sectors all play a role in disaster management. There is a broad spectrum of organizations, each having specific functions, that in times of crisis work closely. In the United States, the public sector is in charge of overall disaster management and is mandated to design and implement plans, programs, and operations. For instance, the public sector's responsibility is to develop policies and plans to mitigate and prepare for a set of hazards and to respond and recover from disasters. The NP sector supports the public sector and operates in different capacities throughout all phases of disaster management. In the United States, the cooperation between the public and the nonprofit sector is outlined in the "Whole Community Approach" policy (FEMA 2011) that aims to create public-private partnership in order to better respond to disasters. Nonprofit organizations (NPOs) have a considerable role in the field of disaster management, since they are at the frontline of the response and already have established strong relationships with local communities. Therefore, NPOs can have an enormous impact on communities, during the pre- and post-disaster phases. These organizations have the potential to tie communities to local/state agencies and carry out surveying and monitoring activities to collect sensible data about citizens and their needs. Moreover, due to the variety of services, they can provide additional support to families, including spiritual relief.

The numerous nonprofit organizations dedicated to relief are an exceptional asset in disaster management, since they are able to deploy a consistent amount of material and human resources. Due to the diversity in their core missions, NPOs can carry out a broad range of activities. When an emergency occurs, it is not just the NPOs that have disaster relief as a core mission that are

called to respond. Many other organizations, established with core missions other than for the purpose of relief, are called by a sense of duty for the common good. For example, NPOs that work in the field of psychological support may join a particular post-disaster relief effort in order to provide support to affected children.

The term nongovernmental organizations (NGOs) is commonly used when referring to NPs involved in disaster management. Some examples of large NGOs operating in the field of disaster management are the International Federation of Red Cross – Red Crescent (IFRC), the International Committee of the Red Cross (ICRC), World Vision, Oxfam, and Doctors Without Borders. NPOs are independent organizations that are organized to address a specific mission and carry out a broad variety of programs and for which they receive private donations. In addition, NPOs may also be contracted by federal, state, and local public organizations to assist with the delivery of services. However, even though NPOs do not generate a profit, they do have legal responsibilities such as reporting on economic activity, tax declaration, accountability, and auditing. In particular, accountability to donors is a very important issue for NPOs, especially during disaster recovery.

## Disaster Management and Nonprofit

The relationships between the nonprofit sector and disaster management are explained in the remaining part of this entry as they occur according to the mitigation, preparedness, response, and recovery phases of the disaster management cycle. A description of the activities that occur in each phase will be provided along with specific examples of how the nonprofit sector operates in each stage or phase of the comprehensive emergency management cycle.

### Disaster Mitigation

Disaster mitigation is the first step of a comprehensive emergency management cycle. Mitigation activities are carried out to reduce or minimize the risk of loss of lives and properties before a disaster occurs. Thus, the goals of hazard mitigation are prevention, property protection, public education and awareness, natural resource protection, critical facilities protection, and structural protection. The role of NPOs in this stage tends to be of advocacy for vulnerable communities and promoting community hazard awareness and hazard adjustments adoption through the formation of public-private partnerships. In some cases, NPOs can serve communities by offering legal support.

Hazard mitigation activities can involve structural or nonstructural interventions. Structural interventions are man-made barriers, such as protection walls, sea walls, and dams. The purpose they serve is to reduce the hazard and limit the impact on communities. Nonstructural measures comprise proactive measures. Building codes, planning and zoning, land development regulations, and open space preservation are some of the proactive activities or measures included in prevention. Acquisition, relocation, rebuilding, and flood proofing are a subset of property protection activities. Natural resource protection includes wetlands protection, dune restoration, reforestation, erosion, and sediment control. The creation of hazard maps, outreach programs for residents and property owners, the disclosure on the part of real estate owners of hazard location are some examples of public education and awareness.

Nonprofit organizations contribute to projects that reduce the impact of hazards facing communities through their involvement in the communities they serve and partnerships with the government. Nonprofit involvement in hazard mitigation supports hazard mitigation planning on two fronts. First, natural hazards hinder the development of the communities that they affect, and second, vulnerable populations such as the less wealthy, elderly, women, children, which are the target of many NPOs, are the most affected by disasters.

A natural role for the nonprofit sector in hazard mitigation is to advocate for the inclusion of vulnerable populations in the governmental decision making process and at times provide legal or other forms of support to these groups. For instance, a community in the Philippines brought the Department of Environmental and Natural Resources to

court for its unwillingness to provide environmental clearance certificate (ECC) on a development project before the start of the project. The community successfully pursued their case to the Court of Appeals. This achievement would have not been possible without the support of a NPO specialized in providing legal services. The legal battle between the Department of Environmental and Natural Resources and the community ultimately went up to the Supreme Court, which is exactly what the NPO wished for since if successful it would acknowledge the right of communities to access and to be consulted for the issuance of ECCs. It is not unusual that when it comes to land development issues, communities are unable to fight back on their own as they do not have training in legal matters, therefore the support of specialized NPO is imperative (Luna 2001). The formation of a community-based organization (CBO) is one mechanism by which the nonprofit sector can contribute to hazard mitigation. A CBO is a nonprofit organization designed to provide services to a community. The characteristic of CBOs is that all the activities are realized through the contribution of citizen volunteer work. The partnership formed between the American Red Cross chapters of greater Miami and the Florida Keys, the Greater Miami and the Keys Chapter, and the Florida Regional Interfaith Interagency Emergency Network in Disaster (FRIEND) is an example of a CBO formed in the United States to address disaster mitigation by engaging the needs of the elderly in the State of Florida – a population especially vulnerable in a state subject to high-winds due to hurricanes or tropical cyclones (Volunteer Florida 2004). High-winds constitute a hazard since they may cause harm to people that could be hit by flying debris which can also cause damage to property. Along the Florida coastline surrounding Miami-Dade County, low income elderly inhabitants constitute a vulnerable population. In partnership, these organizations work together to provide 1,300 hurricane shutters and shutter installation to eligible low income elderly residents (Volunteer Florida 2004).

### Disaster Preparedness

Disaster preparedness is the second phase of the disaster management cycle. It is conceived as a short-term phase, primarily focused on the immediate readiness responses. The main objective of disaster preparedness is to allow the overall emergency system to perform a continuous assessment of response structures and systems in general, plan for response readiness, provide training for first responders in order to quickly deploy assistance, and train communities to be ready to face emergencies (Petak 1985). The role played by NP during the preparedness stage refers to the formation of public-private partnerships aimed at supporting emergency operations such as planning for an eventual evacuation and the training of volunteers.

Disaster preparedness is the fundamental phase that can potentially save lives and allows communities to better understand disasters (Gillespie and Streeter 1987). Disaster preparedness embraces a broad spectrum of activities that span from risk assessment, the development of response strategies and education planning (Keeney 2004). It also requires collaboration among diverse stakeholders, governmental agencies at all levels of government, private sector, and voluntary organizations. A greater interest is being placed upon the role that communities play in this phase. Citizens play a critical role in disaster preparedness activities; moreover, preparedness activities are essential to strengthen communities by supporting community-based activities. Thus, the NP role in the preparedness stage refers more to planning, often times together with the public sector, and preparing communities to respond when needed.

In the United States, Evacuteer.org is an example of a nonprofit organization involved in the preparedness stage of the emergency management cycle. New Orleans, Louisiana, is a city known for the policy fiasco that occurred in response to Hurricane Katrina (2005). Evacuteer.org was constituted in the aftermath of Hurricane Gustav (2008) and is authorized by the city of New Orleans to manage and train volunteers to assist tourists and citizens without cars in case of a mandatory evacuation also known as City Assisted Evacuation (CAE). A mandatory evacuation is issued when there is at least a category 3 hurricane in sight. The City Assisted Evacuation (CAE) targets an estimated 35,000 New Orleanais that will reach one of the 17 neighborhood

evacuspots, a term for pick-up locations, where they will be registered and then transported to the Union Passenger Terminal where they can be connected to existing transportation connections. In addition to assisting in cases of mandatory evacuation, Evacuteer.org also conducts community outreach. One of the needs fulfilled by Evacuteer.org is the lack of dedicated preparedness programs in schools in order to reach out to underserved youth. As the nonprofit reports on its website, there are 78,845 children in Orleans Parish under the age of 18, 39% of which live in poverty, and 19% of overall households do not have access to a car (evacuteers.org). In order to answer this need, Evacuteer.org offers a curriculum in preparedness for children in grades 3–5 (ages 8 to 11). The curriculum is made up of 6-h long discussion on hurricanes as a hazard and it is also aimed at making children aware of the CAE so that they will be able to identify and reach the evacuation pick-up spots. The hope is that children will have this information readily available in case of a mandatory evacuation and will be able to direct their parents and loved ones toward safety.

### Disaster Response

Disaster response is the third phase of a comprehensive emergency management cycle and comprises immediate post-disaster actions to save lives, protect property, and meet basic human needs. Response activities are generally drawn and implemented from preparedness actions and plans. Public agencies, in collaboration with other entities, typically carry out warning and evacuation activities, perform search and rescue missions, assess the damage and the extent of impacts on communities, and estimate the overall needs of the affected communities in order to meet their needs. The most important services provided in the immediate aftermath of a disaster are mental health support or disaster mental health and the provision of basic necessities such as food and hygiene. Where a given national government lacks the resources, substantial help can come from humanitarian organizations. It is not uncommon that large disasters affect the poorest countries in the world. A notable example of intervention by an international NGO is the International Federation of Red Cross (IFRC). The IFRC has at its disposal Emergency Response Units (ERU), which is a standardized and modular package of personnel and equipment ready to be deployed in a disaster area on short notice. ERUs can be called upon in emergency situations, when local facilities are unable to cope and when the IFRC delegation or the national Red Cross or Red Crescent societies in the concerned country cannot respond on their own. ERUs are self-sufficient units that can operate for 1 month and can stay up to 4 months in the impacted country. Different types of ERU are deployed depending on the functions required. These emergency response units include: logistics, information technology, water and sanitation, basic health care, referral hospital, relief and base camp. Logistics ERUs manage the movement of goods and undertakes transportation duties. Information technology and telecommunications ERUs work to reestablishes disrupted communication systems providing communication networks. Water and sanitation (WATSAN) ERUs provide treatment of non-potable water. Basic health care ERUs provide community health care. Referral hospital provides hospital facilities. Relief ERUs undertake assessments and builds up distribution points. Base camp ERUs provide Red Cross or Red Crescent staff with appropriate living and working conditions such as tented accommodation, which are conditioned for hot and cold climates, toilets, hot showers, recreational facilities, kitchens, administrative offices, IT/communication, and coordination facilities in locations where these facilities are not available to Red Cross or Red Crescent staff.

However, it is important to point out that the presence of nonprofit organizations is not always a blessing in the aftermath of a disaster especially in areas characterized by a weak government. The convergence of volunteers, nonprofit organizations, and donations in the affected areas is a condition that sets the stage for problems such as material convergence. Material convergence occurs in large disasters when organizations tend to send a large amount of goods, sometimes not really needed by the affected communities. For example, in the aftermath of the 2010 earthquake in Port Au Prince, Haiti, NGOs brought in bottled water by the boatload, although water supplies

were not necessary at the time. In fact, at that time rice and sanitation equipment were most needed. Another example involves a shipment of refrigerators from Europe that could not be used because the units had a different voltage rating than what was available on the ground; moreover, the earthquake had caused power outages (Holguín-Veras et al. 2012). Material convergence can create serious problems that subsequently impact on warehousing and stocking operations, which require a great deal of effort by the organizations in question to sort and label what is really necessary for the emergency. This complex operation limits the capability of distribution of goods to affected communities resulting in a loss of efficiency.

### Disaster Recovery

Disaster recovery is the fourth and last phase of the comprehensive emergency management cycle. It constitutes a series of steps and actions undertaken in order to restore normal functionality of basic services such as water supply, gas, and power as well as facilitating the recovery of the economy such as reopening of local businesses. In addition, disaster recovery plays an important social/psychological function by restoring social and community networks. This phase is generally divided into short- and long-term recovery. Short-term recovery involves post-disaster decisions and actions taken to replace lost residential and business properties, rebuilding the economic base, and repairing and rebuilding infrastructure. Long-term recovery refers to plans that allow to rebuild the economic and social fabric, in order to give the affected community a new start. Typically, this phase ends with the completion of the entire reconstruction of devastated communities. A key aspect of the long-term recovery is the integration of new practices of mitigation and preparedness, while rebuilding and bringing back the entire system to make communities more resilient and able to cope with future disasters. Globally, there are several examples of projects carried out by NGOs. The majority of these projects focus on strengthening communities and local economies and rebuilding social capital. In addition, NGOs carry out educational programs such as providing basic school education and disaster preparedness education.

An example of a recovery project can be seen in Japan after the Great East Japan Earthquake in 2011. A study conducted by Nakazato and Lim (2017) demonstrated how the Sawayaka Welfare Foundation funded a recovery project named *Domo* in order to promote mutual help among residents of Kamaishi and helped rebuild the local economy. *Domo* aimed to create an alternative currency system, which allowed the trading of goods and services among the community's residents.

## Conclusion

Nonprofit organizations take part in disaster management in the areas of mitigation, preparedness, response, and recovery. NPOs are important players in identifying community needs, communicating information, and ensuring access to services or assistance. In some cases, NPOs collaborate with governmental organizations at various levels of coordination, from local to international. In other cases NPOs counterbalance, supplement, or monitor government policy, in fact NPOs are not an arm of the government as they operate independently from it. Nonprofit organization play a vital role in identifying community needs or gaps in services, advocating for citizens, and undertaking community projects. They raise awareness and advocate for better conditions and sustainable development before and after disasters. Even though, nonprofit organizations support the public sector and in particular disaster management along all the stages of a comprehensive emergency management cycle, it should be noted that they can also generate unintended consequences such as material convergence as seen in the aftermath of the 2010 earthquake in Haiti. The success of nonprofit organizations in disaster management is determined by their ability to integrate with other nonprofit organizations and local, state, and federal

level of government (Salamon 1987; Paarlberg and Varda 2009).

# Disaster Response Management

Frances L. Edwards
Department of Political Science, Mineta Transportation Institute, San Jose State University, San Jose, CA, USA

## Synonyms

Emergency response; Response resource organization

## Definition

There are four phases to emergency/disaster management: mitigation/prevention, preparedness, response, and recovery. Response includes the organization of personnel and resources and the delivery of services to victims and communities with the goal of ending the emergency/disaster. For purposes of discussing this topic, the term "emergency management" will be used, since disaster is a type of emergency. (See the entry on "Crisis, Emergency, Disaster, and Catastrophe Defined.") (Fig. 1).

## Introduction

Unwelcome community events (crises, emergencies, disasters, and catastrophes) require that the resources of the community be organized to deliver services to the victims in the most efficient and effective manner. To meet this goal, the emergency management organization for the community develops a threat assessment, creates plans for responding to these various potential events,

**Disaster Response Management, Fig. 1** Phases of emergency management

organizes personnel and materiel resources to implement the plans – including training, equipping, and exercising – and works with the community to prepare for self-support during potential events. The response becomes necessary when the threat materializes as an event, and people, property, and the environment are threatened with harm or damage. The response may come from the local community or from many levels of government, depending on its severity and the scope and specialized nature of the response that is needed.

## All Disasters Are Local

Various nations organize for response in different ways, but all disasters are local. They occur in some town or village or some state or region, and the victims are the people, property, and environment in that area. In a crisis the area may be very limited – just one neighborhood or small portion of a community – and emergency response resources within the community may be adequate to effectively respond to save lives and property. However, in a catastrophe, the area may include nations on two continents, as in the 2004 Indian Ocean Tsunami. Such an event uses immediate aid from local resources, but requires additional nationwide and even international responders to augment available local resources. Regardless of the breadth of the event, it is people in local areas who experience it and who are present to start rescue and deliver immediate emergency medical care. Unless they are evacuated, they experience the short- and long-term recovery and have a vested interest in all phases of the emergency management cycle.

In some nations, such as the United States, all initial response resources are owned by the local government. For example, police, fire, emergency medical services, and transportation department personnel all work for the locally elected officials. This means that the initial response is centralized in the impacted community, which may enhance the speed and coordination of the resources, but which may also mean that responders and their families are victims of the event. In some nations, such as Japan, the initial response resources are located at different government levels. For example, the fire department works for the mayor of the city, while the police department works for the governor of the prefecture. Some nations, like Italy, have a national fire corps based in the Ministry of the Interior, but the fire chief of the province is still the incident commander at a scene. In Italy they have created uniform regional disaster resource caches and uniform response training, to permit rapid, coordinated assistance across Italy's 20 regions and 101 provinces. Because of the strategic location of these equipment caches across provinces, at least nine emergency response vehicles can be brought to the scene of an emergency event within 1 h. In other nations the emergency response is centrally directed, with support from unaffected governmental subdivisions. Such centralized responses may rely on not only the civilian police and fire personnel but also military units. Regardless of where the assistance originates, the locally elected officials are responsible for the emergency response within the community, and their political careers will be influenced by their success as emergency managers.

## Local Response Organization

The goals of local emergency response are to save lives, limit injuries, protect the environment,

protect property, protect the local economy, and facilitate recovery. The locally elected officials set policy for the disaster response, including priorities for the use of scarce resources, authorize funds for emergency response, and request assistance from higher levels of government when local resources – including money – are exhausted. The city administration translates the goals and priorities of the elected officials into strategic plans for community response and recovery. The professional responders – police, fire, emergency medical services, transportation personnel, and public works personnel – create tactical plans to guide the use of resources in the field to end the emergency and begin recovery. The local first responders may need assistance from professionals in other jurisdictions, which is facilitated through pre-made agreements called mutual aid or emergency management assistance. Ultimately community members, including residents and businesses, are both victims and assets in emergency response. The city's strategic emergency plan provides for a coordinated response among all levels of response – local, regional, state, and federal, and all response assets, public, community, or private.

## Incident Command System (ICS) and National Incident Management System (NIMS)

To ensure a rapid augmentation of local capability during emergencies of all sizes, nations adopt emergency response systems that are used across all jurisdictions. For example, in the United States the Incident Command System (ICS) is the response structure used for all hazards (DHS 2015). This approach provides for dividing the available personnel to accomplish planning, operations, and logistics activities in support of victim rescue and care. ICS was created in California in the 1970s in response to a series of wild land urban interface fires in Los Angeles and San Diego counties that required a coordinated effort by local, county, state, and federal fire service units. It was adopted by large cities in other states, such as Phoenix, Arizona, and then became part of the curriculum at the National Fire Academy in Emmitsburg, Maryland, leading to its adoption across the country as the management system for large-scale events requiring multi-agency response (Fig. 2).

As a result of coordination challenges during the Loma Prieta Earthquake in the San Francisco Bay Area in 1989, ICS was mandated for all state agencies in California with required implementation by 1993, was widely adopted by large cities across the state, and was credited with contributing to the successful response to the Northridge Earthquake in the Los Angeles area in 1994. After the terrorist attacks of 9/11/01, President George W. Bush issued Homeland Security Presidential Directive-5 (HSPD-5) which recognized the role of state and local governments in immediate response to emergencies but also recognized the need for local assistance to local and state agencies when their resources were overwhelmed. It mandated the creation of a National Incident Management System (NIMS) for use during federal response to state and local requests for emergency response assistance. NIMS is based on ICS as the emergency response system (Bush 2003).

Italy has also adopted the Incident Command System. It recognizes the advantages of economy of scale in the development of policies and training curriculum by having one method for managing emergencies. Personnel can be rapidly assigned to a disaster scene in another province or region and immediately be effective because the management system is the same across the nation. Joint training across jurisdictional boundaries offers efficiencies in developing instructional

**Disaster Response Management, Fig. 2** Incident command system

videos and training materials. Uniform equipment can be procured at a better price, and at a large emergency the equipment can be kept in working order because the spare parts are interchangeable.

### Mutual Aid/Emergency Management Assistance

Few communities have the resources to manage every possible emergency, because of the cost of maintaining a large professional response force and stockpiling equipment that may never be needed. After World War II, emergency responders evaluated the damage from aerial bombing and determined that there would have to be outside support to any American city that was attacked. They also recognized that urbanized areas would need search and rescue assistance after a regional earthquake and that rural areas would need help protecting communities from wild land interface fires. In the early 1950s the fire chiefs of California developed a mutual aid agreement, in which they arranged to provide the first shift of disaster assistance for free, with the receiving jurisdiction paying overtime costs, and lodging and feeding expenses. They would also pay for any equipment that was consumed or destroyed. In the following years, the police chiefs joined the California mutual aid agreement, followed by building officials, coroners, public works officials, emergency managers, and more than 20 other professions. In the 1994 Northridge Earthquake, the mutual aid systems provided a variety of professionals to support the City of Los Angeles in response and recovery.

In 1996 the Congress ratified the creation of an Emergency Management Assistance Compact (EMAC) (Public Law 104–321) which all states could join. It provided a framework for requesting and receiving emergency response assistance across jurisdictions, based on a cost reimbursement system. Each state had to pass legislation to join EMAC, which is managed by the National Emergency Management Association, a non-governmental professional organization associated with the Council of State Governments. By the early twentieth century, all 50 states had joined, along with the District of Columbia, Puerto Rico, Guam, and the US Virgin Islands.

### Community Emergency Response Teams (CERT)

Regardless of where the emergency response management originates, the victims are already in the area where the event has occurred. Therefore, engaging the residents in preparedness and self-protection actions will limit loss of life and property damage. Many countries offer training and support for neighborhood emergency response team development, empowering residents to respond to emergencies rapidly with appropriate skills and basic equipment. In Japan the neighborhoods are organized with a "neighborhood mayor," and these groups are the first responders to local fires. Every home has a sand bucket and broom to begin fire suppression while the professionals are on the way. Rapid localized action saves lives and lessens the damage, preventing fire from spreading to adjacent structures. Neighborhood-based teams are also trained for search and rescue, first aid, or evacuation.

In the United States this concept was adopted after the Mexico City Earthquake of 1985 demonstrated that neighbors help each other, even when they are not trained. In this event 10,000 people died and 30,000 were injured. In the presence of such need, local residents formed impromptu search and rescue teams with no training and no equipment. They used the skills and tools available to them to rescue people from building collapses and to provide immediate medical care. These informal neighborhood groups are credited with saving 800 people, but 100 of the volunteer rescuers died in the process.

Seeing this altruistic response and its resulting volunteer deaths, California fire departments borrowed from the Japanese model of neighborhood-level training and created programs to educate and equip willing and interested residents and business employees. Los Angeles, the City of Irvine, and San Francisco were early creators of neighborhood training programs when the Whittier Narrows Earthquake damaged parts of Los Angeles and Orange Counties in 1987, demonstrating the need for immediate response by neighbors to save lives in a widespread disaster.

By 1993 the Federal Emergency Management Agency (FEMA) adopted the Los Angeles model,

called Community Emergency Response Team (CERT), and revised the curriculum to include neighborhood-level response to all hazards. BY 2011 all 50 states were using CERT, which has also been adopted by three US territories and six other nations. The training is delivered both in person and online and covers home and personal preparedness, disaster firefighting, light search and rescue, and disaster medical care.

### Emergency Operations Center

While the field level response is being managed tactically by the incident commander in the field, the strategic management of community resources is conducted from the Emergency Operations Center (EOC) in each community. The work of the EOC is guided by an Emergency Operations Plan that details the roles of the elected officials, city administration, and each department. The challenge for the EOC is to manage the emergency while at the same time guaranteeing the expected services to the undamaged parts of the community. For example, a neighborhood along the river may be flooding, but neighborhoods on high ground will still expect a 5-min response time when they place a medical emergency call. Balancing resources for the damaged and undamaged areas is often accomplished through the use of mutual aid and contractors to augment capabilities needed in the emergency area (Fig. 3).

Many communities use the same Incident Command System concept to manage their EOCs. The difference is that the senior position is called the Management Section Chief, because he is managing strategic assets rather than being in tactical command. His responsibility is to ensure that the field forces have the supplies, equipment, and personnel support needed to achieve the goals of emergency response, while at the same time providing emergency response for personal events for the rest of the community.

## Regional Response: State, Province, and Prefecture

In most nations the next higher level of government provides assistance when an emergency occurs. The regional division in which the effected jurisdiction is located will normally be responsible to augment personnel and equipment resources for the response. It will also have financial obligations for the cost of sheltering the population, providing temporary housing and beginning the short-term recovery processes. Government services like welfare, criminal justice, and schools may be governed at a regional or state level, making them obligated for those aspects of the immediate response and short-term recovery.

The United States is a union of states that were, in some cases, once independent colonies or even countries. Therefore, the Constitution guarantees each state that it will maintain control of its own legal internal affairs, which includes emergency response and recovery. Article 4 Section 4 requires that the state legislature, or the governor if the legislature is not meeting, must make a formal request for a presidential declaration of disaster. Only then can the federal government provide guidance and assistance with organizing a response to the event. Without a governor's declaration of a state of emergency and formal request for financial assistance, the president and the federal agencies cannot undertake a response within a state.

Governors have the resources of the state at their disposal to respond to a local area's

**Disaster Response Management, Fig. 3** EOC organization using incident command system

emergency. Using the State's Emergency Operations Plan the governor and the leaders of state agencies coordinate emergency response. The state level department managing emergency response operates a State Operations Center where representatives of the state's major departments collaborate to provide resources and assistance to the damaged areas of the state. In a crisis the governor may use state resources to augment specific local capabilities, such as providing shelter supplies or drinking water. The governor also has the National Guard at his disposal. The National Guard is the state militia and as such belongs to the governor of the state, unless it is federalized to assist in war fighting. The National Guard can be used for manpower, such as levee building or laying sandbags. During the response to Hurricane Sandy, the New York National Guard evacuated hospital patients from low-lying areas of New York City to hospitals on higher ground. National Guard facilities and supplies were used to establish short-term shelters in city and county parks in Los Angeles after the Northridge Earthquake. In 2014 the Florida National Guard created an agreement with the Florida Power and Light, a private company, to provide assistance with power restoration to damaged communities after a disaster. State resources can be used to hasten the restoration of critical services within a community.

The first financial assistance for emergency-damaged communities must come from the state. Most states split the cost with the local jurisdiction, paying 75% of the response costs for an emergency. This includes overtime for first responders, shelter costs not covered by non-governmental agencies like the American Red Cross, and immediate recovery actions such as debris removal and building shoring. The thought is that the state's tax base will not all be damaged by an event, while the local community's ability to collect sales and property taxes may be damaged for months to years. Property damage, loss of tourism, and closure of industries as a result of an emergency event will lessen a community's ability to pay its budgeted expenses, as well as its emergency response costs.

## Federal Response to Disasters

All disasters are local, but sometimes federal assistance is essential. The national government manages emergency response using the National Response Framework. Once a governor has requested assistance, the federal agencies' representatives gather in the National Operations Center. Using a plan called "Emergency Support Functions" (ESF), the federal resources are organized to respond to the needs expressed by the governor's declaration and the emergency managers at the state level. For example, ESF 1 is transportation, so any requests for vehicles or logistics support for moving people or goods will be coordinated by the US Department of Transportation, using not only its own resources but also the resources of other federal departments with vehicles. There are 14 distinct ESFs, each providing a type of emergency assistance, such as police and fire, public information, and public health services.

Military units may also provide specific types of assistance to local communities and states, but not law enforcement services. The Posse Comitatus Act forbids the use of US troops for any law enforcement function. US Marine Corps units provided drinking water to neighborhoods with damaged pipes after the 1994 Northridge Earthquake. US Air Force personnel provided air traffic control for the Port-au-Prince Airport after the 2010 earthquake in Haiti. Military personnel can establish field hospitals for emergency medical treatments in areas where hospitals have been damaged and transport critically injured and ill patients out of the disaster area to undamaged communities for definitive hospital care. After the 2004 Indian Ocean Tsunami, US troops delivered disaster supplies to damaged areas, provided patrol aircraft for search and rescue support, and airlifted emergency response personnel and equipment from the Unites States to areas of need. Naval ships were sent to Indonesia to provide freshwater, and the 1000-bed hospital ship *Mercy* provided disaster medical assistance. Military hovercraft were used to deliver relief supplies to otherwise inaccessible areas on the tsunami damaged Indonesian coast.

Financial assistance is the most wide-ranging type of emergency assistance. Under the Robert T. Stafford Act, the federal government provides 75% of the emergency response costs to the states in disasters that exceed specified cost guidelines of $1.44/population (see Table 1). This funding includes emergency response costs, short-term recovery costs, and restoration of public facilities like water treatment plants that are damaged in the disaster. In addition, residents of the disaster area may be eligible for disaster-related unemployment, food assistance, and grants for the replacement of lost household goods. In some cases residents may be eligible for financial assistance with repairs of their homes or replacement of a rented apartment (Table 1).

The federal government also assists with field-level civilian response by sponsoring specialized teams. FEMA sponsors firefighting equipment in fire-prone communities. They also pay for training and equipment of the Urban Search and Rescue Teams (USAR) that are based in metropolitan areas and staffed by volunteer professionals from the area. These teams consist of firefighters, search dogs and their handlers, architects and engineers, riggers, communications specialists, and load masters. Their equipment is stored in cargo containers that can be moved on C-130 military aircraft to disaster areas. They are volunteers during practice periods, but become temporary federal employees when they are deployed to disasters. These teams have been deployed to major disasters across the United States for the California earthquakes in 1989 and 1994, hurricanes in Louisiana and New York, and floods in Texas and Missouri. They have also gone to assist in other nations under the US Department of State.

**Disaster Response Management, Table 1** Population and disaster assistance

| Population rank | State | Population | Disaster loss required for major declaration ($1.44 factor) |
|---|---|---|---|
| 1 | California | 37,253,956 | $53,645,697 |
| 2 | Texas | 25,145,561 | $36,209,608 |
| 3 | New York | 19,378,102 | $27,904,467 |

The Disaster Medical Assistance Teams (DMAT) are organized by the US Department of Health and Human Services (DHHS). They are made up of trauma surgeons, nurses, and allied medical professionals, supported by logistics and communications specialists. They are equipped to support themselves for 72 h in the field and are deployed for 2 weeks at a time to disaster areas to augment available medical capability. In 1994 in Northridge, they took over existing hospital positions so that hospital personnel could go home to deal with the earthquake's impact on their homes and families. They have been deployed to disasters in the United States and abroad. Members are recruited and screened by DHHS and serve as volunteers until they are deployed, when they become temporary federal employees.

## Conclusion

Disaster response requires the coordination of personnel and equipment across professional and jurisdictions. All disasters are local. Help must be organized beginning at the local level. As the severity and scope of the disaster increases, mutual aid from neighboring jurisdictions and even assistance from the international community may be required. Each level of government has an important role in achieving the disaster response goals of saving lives, protecting property and protecting the environment. The legal responsibility lies with the locally elected officials, who can request assistance from the next higher level of government when local resources are overwhelmed. The federal government only responds on the request of the

state to augment their capabilities, with both resources and funds.

# Disclosure in SOE

Alessandra Allini
University of Naples Federico II, Naples, Italy

## Synonyms

Communication; Information; Reporting

## Definition

Disclosure consists of the display and communication of information to parties in order to make them advised on a specific issue and allow to predict or assume appropriate decisions.

Disclosure is a crucial topic in accounting and finance studies, even if it has been considered also in other strands. Generally, disclosure has been conceived as a tool for the functioning of an efficient capital market related to the optimal allocation of savings to investment opportunities. In particular, firms would like to attract the highest amount of resources by investors to support their activities. However, the relation between investors and the firm is not linear and two kinds of problems mainly arise.

First, the firm has better information than savers on the real value of investment opportunities and tends to overstate. Savers, hence, face an asymmetry information problem. Second, once savers invest, firms have an incentive to expropriate their savings. In this regard, between firms and investors, information asymmetries and conflicting interests create a so-called lemon problem (Healy and Palepu 2001).

Conflicting interests, however, are peculiar in state-owned enterprises (SOEs). SOE usually encompasses firms where the state government or local authorities either (1) own over 50% of the share equity or (2) own less than 50% of the share equity but are entitled to appoint of the majority of directors and consequently prevail in voting at general meetings. In most Organization for Economic Cooperation and Development (OECD) countries, SOEs are a means for national and local governments to support the economic growth and the development of a territory or a sector, and they account for a large part of gross domestic product. They manage public money and pursue social goals that coexist with economic objectives. Their inherent mandates, inevitably, clash with the economic rationale that determines profitable decision-making. In addition, SOEs often constitute a particular blend of characteristics that are conducive to conflicting tendencies: political interests may compromise efficiency and effectiveness; directors may favor their own personal interests and gains, and government ownership, in whole or in part, entails reduced risk of failure.

## Disclosure Within the Agency Framework

Within the so-called traditional agency approach, conflicting interests deal with the relationship between the principal and the agent. Principals hold agents accountable upon obligations; however because of information asymmetry, a principal cannot effectively monitor agent's actions. Within an SOE, the information asymmetry problem assumes a double, peculiar perspective based on a two-tier collusion. Specifically, the government is the controlling shareholder whose interest

is not always aligned with that of minorities. Within the agency theory, this represents a principal–principal conflict, where the conflict refers to the appropriation of firm value from minority by dominant public shareholders.

Furthermore, in SOE there is also an agency–principal conflict, as the relation between citizens and the state owner is blurred. From this view, the citizens who vote are the principal, while the state shareholder is their agent, since the latter acts on their behalf (Argento et al. 2010).

Here the question of moral hazard also arises. The agent is susceptible to the pursuit of self-interest rather than the public interest (Hinna et al. 2010). This is because the SOE strategic goals are difficult to define and encompass multiple (sometimes conflicting) objectives related to political, social, and economic aspects. For example, while the efficiency goals strictly rely on the production of services, the social ones mean universal accessibility to services of appropriate quality and substantial amount of public funds to support such production. The ability of the principal to limit opportunistic behavior depends on how much information it has.

In this regard, disclosure has been perceived as a way for mitigation, and regulation aims at improving the quality of information available to principals and enforces their capacity to hold agents accountable.

Regulation may mandate disclosure to achieve market fairness purposes and reduce the information asymmetry. In this view, the annual report is considered a primary mandated reporting mechanism that enables users to assess firm performance. However, the degree of regulation can vary based on several motivations: the rule can overall regulate how, when, to whom, and what discloses or, conversely, covers only some aspects. In this latter case, for example, firms may be required to provide information on a specific issue but can, discretionary, decide the type and nature of information to parties.

Mandatory disclosure of SOE also concerns information related to performance, which enables the firm to be responsible for its actions and provides stakeholders with useful information for decision-making.

A study conducted by the OECD (2015), however, suggests the existence of a variety of approaches in the reporting of financial information, including the integration into the year-end report. Indeed, among OECD countries, the SOE annual reports are often available to the public through web site, while for timeless of publication, some countries have adopted specific rules and policies to encourage to publish reports timely.

## Disclosure and Public Accounting Harmonization

With the new public management (NPM), each government regulated the accounting systems and financial reporting with its own domestic legislation. Divergence in regulation among countries and within countries exists in recording approach, measurement rules, and disclosure requirements. Then, an important process of standardization started during mid-1980s with the aim to increase accounting comparability worldwide. Such process recommends the public sector to prepare their financial reporting in accordance with International Public Sector Accounting Standards (IPSASs) issued by the International Public Sector Accounting Standard Board (IPSASB). IPSASs consists of a set of high-quality accounting guidelines for the preparation and publication of financial reporting by governments and other public sector entities, whose main common feature consists of the accrual basis of reporting (instead of the cash basis principle). The aforementioned adoption of a uniform corpus of accounting standards by local and central governments encourages the international convergence of financial reporting systems worldwide.

Such reform is still in progress, and its main trends include the convergence of IPSAS toward the set of International Accounting Standards for the Private Sector (IAS/IFRS) issued by the International Accounting Standards Board (IASB), the harmonization of national and international public sector accounting, the harmonization of accounting and statistics reporting systems, and the development and adoption of managerial accounting tools.

Although IPSASs are not mandatory, they are producing considerable effects, and a strong debate in the academic literature has emerged, questioning the appropriateness of introducing private sector management and accounting principles and techniques into the public sector.

The most debatable aspect concerns the move to accruals in government financial reporting and budgeting. Empirically, certain countries have been already adopting full accruals in both financial reporting and budgeting system, using standards that are mostly consistent with IPSAS requirements (e.g., Australia, Canada, and the UK), while a range of other governments has declared the intention to adopt the accrual basis tendency to IPSAS (e.g., Israel). To encourage and enhance international transparency and comparability, both setters and governments worldwide have been intensively working on upgrading public sector accounting standards and their equivalent domestic rules.

A survey by Christiaens et al. (2014) concludes that among 59 jurisdictions worldwide, the "old" European local governments have adopted accrual accounting tendency to IPSAS, while about 17% are still limited to cash accounting. The authors believe that the main reasons for using the IPSAS are related to the fact that such standards will improve the (inter)national comparability of financial information and facilitate the consolidation of financial statements. Instead, the new European countries are still working on accounting reforms in order to modernize their financial information system toward IPSAS. Conversely, outside Europe, Latin America countries reveal a favorable situation for accrual accounting, particularly for IPSAS.

Of course, additional financial performance information may be provided by an SOE based on other requirements – such as the efficiency or the cost-effectiveness of policies and programs – which draws on variables external to the body of the financial statement and adds further depth to the performance. For example, Finnish SOE annual reports have to include the value of EVA, while in New Zealand, the value-based reporting (VBR) should be carried out by SOE (OECD 2015).

In this regard, in a growing number of OECD countries, especially after the strong role recognized to both international accounting standards IPSASs and IAS/IFRS, the SOEs have to prepare a Directors' Report which includes information on review of operations and relevant activities, relevant changes in the statement of affairs and in the environment that may affect an SOE performance or forward-looking plans, main developments, and information on members of the board of directors, including their skills, experiences, and responsibilities as well as board activities. Such report may be integrated or substituted by the Corporate Governance Report. This report is typically required for listed SOE with the aim to inform users on governance mechanisms. Information includes board and audit composition, board and audit activities, other governance committees, risk management system, and ethics policy. Conversely, aggregate information on SOE performance by sectors as a whole is still scarce.

## Disclosure in SOE Within the Stakeholder Theory

Disclosure has been employed also as a tool to ensure greater accountability from the stakeholder perspective (Freeman 1994). This theory is grounded on the idea that firm has a wide range of stakeholders other than shareholders. Based on the existence of a social contract with the firm, stakeholders are those having "a reasonable right" to ask a firm being *accountable* on its performance and going concern conditions. Stakeholders rely on any groups or individuals having a formal or unformal relationship with an SOE, who can affect or are affected by its activities. A range of stakeholder interests in SOE may include taxpayers, voters, suppliers, lenders, creditors, investors, governmental and local agencies, analysts, employees, trade unions, etc. Therefore information, for example, on economic and organizational aspects, as well as on future risks, strategies, management performance, efficiency, and investments, may support decision-making by different users and

demonstrate also how public money has been spent by an SOE and whether efficiency principles have been achieved (Guthrie 1993).

Disclosure enlarges corporate stewardship beyond its focus on shareholders. Although accountability is desirable, its concept is however ambiguous and has undefined boundaries. Scholars argue that it can have multiple meanings and can be intended as a mechanism, a relationship, or even a process. To this end, disclosure for the discharge of the accountability paradigm concerns a much wider and comprehensive range of information to comply with all relevant stakeholders' requirements having social, economic, and political interests.

## Disclosure in SOE Within the Legitimacy Framework

The role of disclosure has been observed also in the frame of the legitimacy theory, focusing on the relationship(s) between organizations, the State, individuals, and groups (Gray et al. 1996).

A primary aspect of this approach – common also to the stakeholder theory – is that disclosure policies are regarded as a mean to constitute a strategy to influence the organization's relationships with the other parties with which it interacts. Legitimacy theory is mainly grounded on the idea that there is a social contract between the organization and the society in which it operates. Such a contract implies explicit and implicit expectations of the society in relation to organization's activities and, in turn, fosters organizations to constantly seek to ensure that other parties perceive them as legitimate.

Legitimacy – indented as the generalized perception that the actions of an SOE are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions – is a relative concept. It represents a resource for the organization, that if is unable to legitimate itself will be likely to perish. On this basis, organizations try to activate a number of mechanisms and strategies to achieve legitimation, and among them a relevant role is played by disclosure since it informs interested parties about an SOE performance, its strengths and implications of its activities.

However, when legitimacy worries trigger the disclosure process, then the information divulged may be motivated by survival purposes rather than by a desire to achieve greater accountability. This may give rise to disclosures that are mere legitimation devices and not accountability mechanism. Thus, to understand if disclosure is aimed at reaching mere legitimation, a possible way is to ascertain if this is adopted as a symbolic or as a substantive approach. Symbolic techniques do not reflect any real change in SOE activities, while substantive techniques involve real material change in goals, structures, and processes, or socially institutionalized practices.

These issues are becoming increasingly relevant with reference to trends in voluntary disclosure that, over the last years, have been progressively developed to satisfy increasing accountability demands and which are beyond the scope of financial statements.

## Voluntary (Sustainability) Disclosure

The decision to provide voluntarily information is typically modeled within a cost–benefit framework. Costs include mostly exposure to competitive and political visibility, as well as the cost of preparing information. Benefits typically include lower capital costs and enhanced firm image, responsibility, and credibility.

The SOEs are expected to voluntarily disclose information when they perceive that benefits exceed direct and indirect related costs. A well-known example of existing voluntary disclosure concerns nonfinancial information, which typically includes social, environmental (sustainability), and forward-looking information and future business strategies. The main issue underlying the social/sustainability reporting is how an organization contributes or intends to contribute to the improvement or declining of economic, environmental, and social conditions at the local, national, or global level.

To foster the sustainability, reporting should be a prime issue especially for an SOE, since their

activity is strictly related with the community, their responsibilities are wide, and their accountable level is broad ranging. Their strategies, plans, actions, and decisions directly affect the economic, social, and environmental well-being of the community. In this regard, voluntary sustainable reports may be perceived as a powerful tool in the management, planning, control, and accountability of SOE with their social and environmental commitments.

In supporting such voluntary disclosure worldwide, on 1997 the Global Reporting Initiative (GRI) was founded in Boston. It is an international independent organization that helps companies, governments, and other organizations to enhance and communicate the impact of their activities on critical sustainability issues, such as climate change, human rights, corruption, and many others. Such body has issued specific guidelines to encourage the adoption of sustainability reporting, specifically, into the public sector.

Namely, the GRI Sector Supplement for Public Agencies (GRI 2005) states that public agencies are invited to produce a sustainability report in order to promote transparency and accountability, strengthen organizational commitments, be a benchmark for the private sector, improve governance mechanisms, highlight the significance of its role as a consumer and employer, comply with disclosure expectations, and provide information to support dialogue and effective involvement with stakeholders. Empirically, however, research suggests that the sustainability reporting by SOE and within the public sector is an initial stage, in part due to a lack of consistency in the type and extent.

## Risk Disclosure

Among voluntary disclosure (i.e., nonfinancial), risk information is also another important strand in SOE (Allini et al. 2016). Corporate failures have alerted financial markets to the importance of assessing certain sources of risks and uncertainties and of the need for better quality information. Risk is broadly defined as the uncertainty associated with either a potential gain or loss (Solomon et al. 2000). Its disclosure means the inclusion of (financial and nonfinancial) information about any opportunity, hazard, danger, harm, threat, or exposure that has already impacted or may impact over the firm, as well as the management of any such opportunity, prospect, hazard, harm, threat, or exposure (Linsley and Shrives 2006).

In the case of risk disclosure, the boundary between mandatory and voluntary is quite blurred. Almost all the main international and national standard setters and regulators recommend that any relevant information on future risks and uncertainties should be disclosed by firm in the annual report. However, no strict guidelines are given about either content or form, which still essentially depends on the company's attitude to disclosure.

Considering that the field of risk disclosure is remarkably wide ranging, a notable relevance for the public sector has been attributed to non-*financial risk disclosure*.

It is intended as the volatility of expected future earnings or cash flows not related to financial investments, but to "business and operational risk, regulatory risk and environmental risk, as more valuable information about a firm's total risk exposure" (Lajili and Zéghal 2005: 126).

To date, nonfinancial risk disclosure has been inadequately regulated in the international arena. Most of the initiatives, in fact, regard corporate disclosure only. Nevertheless, in the first document on the matter, Statement of Position 94–6, the Securities and Exchange Commission (SEC) invited American companies to disclose the nature and effects of nonfinancial risks voluntarily. This strengthens the informative content of the management and discussion analysis as required by Registration Statement 501–07 and provides investors with an opportunity to look through the eyes of management. The SEC requires foreign listed companies to present the 20-F form, disclosing all information related to potential risks. In the UK, the Combined Code (Turnbull Report) (1999) has strongly recommended that companies should disclose all risks and related effects in a section of the annual report, the Operating and Financial Review, which is similar to the

MC. The English standard setter, the Accounting Standards Board (ASB), since 2006, has issued various standards that called for more transparency in risk disclosure. In Germany, the GAS 5 was issued in 2000. It was devoted exclusively to risk disclosure. Since then, German listed companies have been requested to assign a specific section in the MC to exploring potential risks. More recently, in December 2010, the International Accounting Standards Board (IASB) issued the IFRS practice statement on MC. It pointed out that the MC is a narrative report that is an integral part of the annual report and that it "provides management with an opportunity to explain its objectives and its strategies for achieving those objectives." Subsequently, in January 2013, the IASB included in its agenda the disclosure framework project which aims to make disclosure more effective.

As far as international regulation is concerned, there are very few indications specifically referring to the SOE. Only the OECD has issued guidelines related to the corporate governance of government-owned firms (OECD 2015) and in the section concerning disclosure, it recommends that companies "should disclose material information [. . .and] any material risk factors and measures taken to manage such risks."

From the European perspective, more recently, the European Commission has issued the Directive N. 2014/95/EU to mandate disclosure of some nonfinancial information for certain type of firms. Namely, it requires only large companies to disclose in their annual report (or in a separate report) information on risks, policies, and outcomes as regards environmental issues, social and employee aspects, respect for human rights, anticorruption, and diversity in the board of directors. The new rules will only apply to firms with more than 500 employees, including listed companies, other public interest entities, and even companies designated by the State, based on their activities, size, or number of employees.

The law, in any case, leaves a degree of discretionary in the content disclosed – requiring firms to provide information that they consider most relevant and useful – and in the way to report – recognizing firms to use international, European, or national guidelines which they consider appropriate. The Directive entered into force on 6 December 2014 and EU states have 2 years to include it into their domestic legislation.

## Definitions

| | |
|---|---|
| Associative mindset | The recognition of the symbiotic relationship between business and society and the values at stake. |
| Business and society field | An academic area of inquiry into the role of business organizations in society. |
| Corporate social responsibility | An area of business and society research that addresses the obligations that firms have to society. |
| Corporate social responsiveness | An area of business and society research that examines the processes by which managers can discern and respond to stakeholder expectations of business responsibilities. |
| Corporate social performance | An area of business and society research that examines the outcomes or impacts of corporate conduct. |
| Discovery leadership | A theoretical perspective on the type of executive capable of activating the personal and organizational values that enable a firm to achievesocially outcomes. |
| Economizing | The ability of firms to covert inputs into outputs efficiently for profit. |
| Ecologizing | The capacity of firms to forge cooperative, collaborative linkages with communities that function adaptively to sustain life. |
| Pre-paradigm stage of normal science | Refers to investigation that occurs before the scientific community has reached a consensus on a general framework or paradigm for approaching problems and solutions. |
| Social contract reasoning | A form of reasoning broadly concerned with the nature of social agreements and, in the business and society field, more narrowly used to establish conditions under which corporations have institutional legitimacy. |
| Stakeholder research | Inquiry into the expectations that various groups in society have of business conduct. |
| Triple bottom line | An accounting of corporate conduct according to its impacts on people, profit, and planet, also known as social, economic, and environmental impacts. |

## Introduction

The model of discovery leadership for corporate responsibility is an outgrowth of decades of business and society inquiry, starting with social contract reasoning and followed by research on corporate social performance. Of this research, discovery leadership is especially informed by the understanding that organizational culture is a means by which executives can direct their firms to be socially responsible. Discovery leadership elaborates on the type of executive mindset needed for this enterprise and the values at stake.

## Social Contract Reasoning in Corporate Responsibility Research

The idea of discovery leadership for corporate responsibility is consistent with the claim that

business has institutional legitimacy if it serves social betterment. This assertion was established by decades of social contract reasoning in the business and society field, some of which harkens to Adam Smith's (1776) particular use of it to propose that exchanges in markets based on mutual benefit will serve the greater good, if institutional rules support this outcome. According to Denis Collins (1988), this famous justification of capitalism was based on an implicit social contract that justifies the activities to be permitted in the economic sector as subject to certain boundaries. Business and society scholars in the modern era, an eclectic group of political scientists, legal scholars, organizational theorists, economists, psychologists, sociologists, and normative philosophers, have extended Smith's use of the social contract by clarifying society's boundaries for business in general and the nature of agreements between firms and their stakeholders in particular.

According to R. E. Freeman (1984), these stakeholders include customers, suppliers, business partners, stockholders, employees, social activists, the media, government regulators, civic organizations, and local communities. Initial research on corporate responsibility stressed that the conscience of the chief executive officer is an important factor in determining whether a firm uses its power responsibly to comply with existing institutional rules and regulations on the one hand and stakeholder expectations of responsible conduct on the other. Examples of such expectations include that stockholders want strong economic performance, consumers seek product safety, workers desire equitable pay, environmental activists value environmental sustainability, and communities hope that firms will contribute to local causes in the form of philanthropy. Increasingly, these expectations have been formulated in terms of the triple bottom line, which means that corporations are thought to have economic, social, and environmental responsibilities to stakeholders, some of which are legally mandated and some, such as philanthropy, are discretionary but expected nevertheless (Elkington 1994).

The question of how firms can discover these expectations and respond to them has been a theme in the field's corporate social performance research.

## The Discovery Orientation in Corporate Social Performance Research

Social contract reasoning in the business and society field has led to a view of corporate social performance that distinguishes between corporate social responsibility, corporate social responsiveness, and corporate social performance. Donna Wood (1991) captured these distinctions by pointing out that *responsibility* addresses the obligations that firms have to society, *responsiveness* indicates the processes by which managers can discern the nature of these responsibilities and contend with them, and, finally, *performance* focuses on the actual impacts or outcomes of these processes. Scholars who conduct research on responsiveness, the action counterpart to responsibility, have extended social contract reasoning to conclude that corporations should anticipate and respond to social pressure, formulate solutions to social problems, and be guided by principles of responsibility while doing so (Carroll 1979).

Processes of responsiveness include environmental assessment, stakeholder management, and issues and crisis management, often carried out by public affairs specialists who communicate with stakeholders to ascertain their interests and expectations. In other words, processes of responsiveness came to be seen as important means for discovering and carrying out responsible corporate social performance. Whereas earlier research portrayed corporate responsibility as mostly dependent on the conscience of the chief executive officer, research on corporate social performance looked to the whole organization for the implementation of policies for responding to stakeholder expectations of responsibility. According to this view, firms need to detect these expectations on an ongoing basis, an understanding that greatly influenced the model of discovery

leadership, described later. Likewise, the discovery model benefited from corporate social performance research that addressed how leadership of organizational culture helps determine a firm's potential for responsible conduct. Instead of relying solely on the executive's conscience to determine this potential, as previous research had done, this newer line of questioning pointed to the role that personal and organizational values have in shaping organizational decisions and outcomes and how executive leaders help determine them (Swanson 1999).

For instance, this line of inquiry examined how executives who encourage the organizational values of *teamwork*, *trust*, and *employee cohesion* may obtain the organizational value of more *productivity* than if they pit employees against one another to fuel distrust (Treviño and Nelson 2004). Pursuant to this research, such distrust may contribute to low morale and render employees unable to address the problems and opportunities posed by the external environment, including those related to stakeholder expectations (Schein 1985; Swanson 1996). Put more affirmatively, the proposition was that organizations that embody constructive values, such as *teamwork*, *trust*, and *employee cohesion*, have more potential to deliver responsible impacts to society, according to corporate social performance analysis.

William C. Frederick (1995) contributed to this analysis by categorizing such impacts as values-driven outcomes of economizing and ecologizing processes, the former referring to the ability of firms to covert inputs into outputs efficiently for profit and the latter describing their capacity to forge cooperative, collaborative linkages with communities that function adaptively to sustain life. That these two large-scale outcomes can be understood to be the legitimate goals of business (Waddock 2009) recalls social contract reasoning and the obligatory nature of corporate responsibility. The macro value processes of economizing and ecologizing can also be understood in terms of the triple bottom line, as when firms fulfill their economic function (economizing) while also contributing to the well-being of the community and the natural environment (ecologizing). Or, as John Elkington (1994) put it, positive triple bottom-line impacts are those that sustain people, profit, and planet. A case in point that illuminates the role of organizational and stakeholder values in the pursuit of the triple bottom line is when an executive directs employees to prioritize *product safety* and this policy enhances *profitability* because the firm garners a reputation for protecting *consumer well-being* (Fombrun 1996). Another example along these lines is that a policy of *efficiency* in reducing waste from production may gain a firm a reputation for protecting *environmental well-being* that yields *economic benefits.* Accordingly, the economic, social, and environmental goals of triple bottom-line policies are not necessarily mutually exclusive, particularly for firms that accrue good reputations for collaborating with communities by providing philanthropy that results in positive social and environmental impacts.

## Realizing Discovery Leadership for Corporate Responsibility

Building on these research orientations, Diane L. Swanson (2008, 2014, 2017, 2018) proposed a model of discovery leadership that highlights the executive's role in shaping a values-driven organizational culture capable of corporate responsibility. As a result of doing this, she recast the field's earlier emphasis on the role of the executive's conscience in determining corporate responsibility by specifying the mindset needed for directing a firm to discover and respond to stakeholder expectations, the latter constituting the kind of responsiveness that was stressed in subsequent corporate social performance research. Swanson calls this mindset "associative" and proposes that it is a necessary condition for discovery leadership. Specifically, as summarized below, she held that four interrelated realizations define this mindset, starting with an executive's awareness that a firm is not separate

from its environment but is symbiotic with it. The second realization follows from the first: under the terms of the social contract, an executive realizes that his or her responsibility is to strive for a balance in delivering triple bottom-line outcomes that will serve the greater good. The third realization emphasizes that values are key to an executive's ability to find ways to direct organizational decision processes toward these goals.

*Realization #1*: *Business organizations have symbiotic relationships with their social and natural environments.*

*Realization #2*: *The responsible business leader pursues a balanced enactment of economic, social, and environmental goals.*

*Realization #3*: *The responsible business leader discovers how to embed (a) value information and (b) personal and organizational values that facilitate triple bottom-line performance into organizational decision processes.*

In keeping with the first part of Realization #3, the responsible executive will direct public affairs specialists and other employees who span the boundary between the organization and society to discern stakeholder expectations of triple bottom-line performance and find ways of establishing communications channels that transmit this value-defined information to decision-makers throughout the firm. The second part of Realization #3 highlights the need for the executive to discover how to embed the personal and organizational values that allow for the pursuit of triple bottom-line performance into a firm's culture. Candidates for such *personal values*, drawn from Milton Rokeach's (1973) classification of values, include *broadmindedness, capability, courage, helpfulness, honesty, imagination, logic,* and *responsibility*. To illustrate, public affairs specialists who operate on the boundary between a firm and its environment must be *broad-minded* and *imaginative* enough to discern the value-defined expectations of stakeholders, such as consumers' anticipation that they have a *right to know* product ingredients. By implication, executives striving for corporate responsibility will direct these specialists to be *accountable* and *truthful* in conveying these expectations to senior managers and other employees and, ideally, exhibit the *courage* to be *honest* when such information is not welcome. Moreover, *responsible* public affairs specialists will understand the need to engage in *helpful* and *honest* communication with stakeholders in the process of discovery.

The second part of Realization #3 signifies that the associative executive understands the need to discern the *organizational values* that facilitate responsible performance and embed them in decision processes as well. Examples of such collective values in an organization include *communication, community well-being, compliance, cooperation, efficiency, economic growth, ecological sustainability, employee cohesion, quality, innovation, learning, productivity, product quality, resource conservation, safety, teamwork, transparency*, and *trust*. Many of these values are interrelated as synergistic means to triple bottom-line goals. For example, *efficiency, productivity*, *teamwork, cooperation*, *employee cohesion,* and *innovation* are values that can be leveraged in support of *economic growth*, *community well-being*, and *resource conservation*. The associative executive understands the need to embed these values into organizational culture and leverage value synergies. This type of executive believes in the value of *learnin*g from this experience, which points to the fourth realization necessary for discovery leadership.

*Realization #4*: *The responsible business leader directs employees to learn continually about the firm's economic, social, and environmental impacts and stakeholders' expectations and assessments of them.*

According to this perspective on leadership, tracking a firm's triple bottom-line impacts and stakeholders' assessments of them allows for the value of *organizational learning* to be part of discovery. It follows that the validity of this information may be bolstered by reporting designed to measure it, such as that established by the Global Reporting Initiative (GRI 2012).

## Discovery Leadership and Scientific Investigation

Swanson (2018) proposes that two main meanings can be ascribed to discovery for corporate responsibility. The one described so far is that responsible executives must lead their firms to detect stakeholder expectations of triple bottom-line goals and find ways to respond to them on an ongoing basis. The second, less obvious, meaning of discovery stems from the nature of scientific investigation. Specifically, some of the values necessary for the scientific investigation on the one hand, and leading discovery cultures on the other, are the same, including *learning, broadmindedness, teamwork, quality, cooperation, truthfulness, imagination, logic, innovation, communication, accountability*, and *transparency.* These affinities imply that executive leaders must necessarily conduct themselves as do scientists who continually seek to comprehend cause and effect relationships and adjust their theories-in-use accordingly. For the discovery leader, understanding value relationships and their effects is key to pursuing corporate responsibility and learning from the experience.

A more indirect affinity to scientific inquiry pertains to the eclectic nature of cross-disciplinary research that spans decades in the business and society field. Thomas Kuhn (1970) refers to this state of investigation as the pre-paradigm stage of normal science during which scientists who have not reached consensus on a general theory seek to assimilate findings into a coherent framework that reflects a stockpile of knowledge. Similarly, discovery leadership represents a framework that assimilates business and society topics according to their coherence while, at the same time, it points to the possibility of a general theory of corporate responsibility leadership that has been lacking. Consistent with the nature of discovery in science, this perspective is poised to accommodate additional research.

## Some Areas for Additional Research

Discovery leadership for corporate responsibility has many implications for research that can inform practice. Of these, the role of boards of directors in hiring associative executives is especially significant. For instance, it is important to know how boards can determine if executive candidates realize that relationships with stakeholders are symbiotic. According to the discovery approach, if this perception if absent, then prospects for responsible leadership are slim. One possibility for determining if an executive candidate realizes symbiosis is to give him or her a personality survey designed to assess this perception. For example, one study suggests that the personality factor of agreeableness, which denotes the inclination to be cooperative, friendly, altruistic, tender-minded, and trusting (Goldberg 1993), is consistent with an other-regarding associative mindset (Orlitzky et al. 2006). This research, although preliminary, hints that it may be possible to develop a questionnaire that measures associative thinking as a way to augment other methods for screening executive candidates for responsible leadership potential.

It is also important to investigate ways to handle organizational value conflicts, as when the goal of improving *productivity* may compromise consumer product *safety.* This investigation should address the following questions: Who in the organization is best suited to detect and track such conflicts? Should this task be centralized in one office or decentralized throughout the organization? What kind of conflict risk analysis and reporting should the discovery leader require? Research should also address whether a flatter chain of command could speed the transmission of such information to the executive and other employees. If so, then it may be possible for value conflicts to be addressed in a timely manner before they risk a firm's reputation, as when *safety* concerns are ignored in favor of rushing a harmful product to market for short-term financial gain.

The discovery perspective would also benefit from a fuller accounting of the means by which an executive can embed those values that facilitate triple bottom-line outcomes into a firm's culture. Andrew Savitz (2013) suggests that hiring employees who share such values is a good place to start, which implies that valid screening techniques need to be developed for this purpose, along with commensurate job descriptions and reward and promotion criteria.

Comparing the triple bottom-line performance of firms that employ such practices to those that do not could further develop the theory and practice of discovery leadership. Likewise, studies that benchmark optimal triple bottom-line outcomes across industries could enhance society's understanding of conditions under which public policy and regulation should provide special oversight of firms that lag their peers in responsible performance. This kind of research could also be used to benchmark best practices established by discovery executives.

# Discretionary Behavior: An Islamic Perspective

Osama Hazzi[1] and Musab Hamod[2]

[1]FrontiersToday, Vienna, Austria

[2]Damascus University, Damascus, Syria

## Synonyms

Personal initiative; Proactive work behavior; Voluntary behavior

## Definition

From an organizational standpoint, discretionary behavior is defined as the behavior that is not prescribed as part of one's organizational role, and that contributes in the aggregate to enhancing the welfare of the organization and its members. From an Islamic standpoint, discretionary behavior is defined as the behavior that is originally innate, but it is learnable over the time.

## The Essence of Discretionary Behavior

Discretionary behavior has been studied in the organizational behavior field with a number of overlapping and related constructs such as helping behavior, organizational citizenship behavior (OCB), personal initiative, proactive work behavior, prosocial organizational behavior and volunteering behavior. Considerable attention was devoted to some of such behaviors by a number of behavioral and social scientists during the 1980s and later (e.g., Brief and Motowidlo 1986; Smith et al. 1983). Nowadays, the evolution of workplace demands organizations to pay more attention to discretionary behavior. Indeed, organizations cannot predict all contingencies in advance. Discretionary behavior, however, provides the organization the flexibility needed to work and better enhance the social machinery of the organization which, in turn, can enhance the workplace dynamics.

From an organizational standpoint, discretionary behavior is defined as the behavior that is not prescribed as part of one's organizational role, and that contributes in the aggregate to enhancing the welfare of the organization and its members. Substantively, discretionary behavior is important to foster the social and psychological environment in which task performance takes place, thereby, contributes to achieving favorable outcomes. As is commonly known, the organization is considered as a social construct and can flourish according to the quality of inter-employee relations and the employee-organization relations. In general, discretionary behavior tends to take on two forms: one directed at the individuals within the organization and one directed at the organization itself.

Theories such as Social Exchange Theory (SET), Social Network Theory (SNT) and Team Member Exchange Theory (TMX) can help us to some extent to ideate the working mechanism of the discretionary behaviors. For example, mutual bonds emerge in social interaction as people who incur obligations reciprocate but imbalance resulting from unilateral benefits engenders superior status (Blau 1964). In organizational settings, employees will only contribute their discretionary effort to problem-solving if they believe that their individual interests are aligned with those of the organization, and that the organization will make a reciprocal investment in their well-being (Macduffie 1995).

There are different perspectives showing different factors potentially affecting discretionary behavior. Research showed that individuals with high emotional intelligence may more tend engage in discretionary behavior (Turnipseed and VandeWaa 2012). On the other hand, discretionary behavior such as OCB is rooted in an individual's intrinsically motivated effort (Organ 1988) and does not represent expressive behavior owing to emotional states (Organ and Konovsky 1989). The style of organizational leadership also is another factor potentially affecting discretionary behavior such as OCB. Indeed, leadership behavior is one of the most predominant antecedents of such behavior (Hazzi 2018). Therefore, in practical terms, there are strong reasons why organization encourages the style of transformational leadership behaviors (e.g., transformational behaviors, articulating a vision, high performance expectations and intellectual stimulation), for example, may influence discretionary behavior such as OCB.

Within the context revealed above, discretionary behavior may be indirect or direct and one-way or reciprocal, and that might be stimulated by factors attributed to either what called the personal initiative or the quality of the organizational settings. The following question, however, may be raised: how could be discretionary behavior explained according to Islamic perspective? The next section provides some insights of how Islam considers discretionary behavior.

## Discretionary Behavior in Islamic Thinking

Islam gives a human the freedom of choice to take the road they want. *And a soul and Him who perfected it, And inspired it (with conscience of) what is wrong for it and (what is) right for it. He is indeed successful who causeth it to grow. And he is indeed a failure who stunteth it*. (Qur'an 91: 7–10). One of the messages these Qur'anic verses include shows that discretionary behavior can be either helpful or unhelpful. However, these verses are ostensibly opposed to the Qur'anic verse (39: 62): *Allah is Creator of all things, and He is Guardian over all things*. The phrase of *"all things"* stands for an absolute meaning including behavior. As a result of such ostensible contradiction, different schools showing different perspectives were originated.

One school finds that a human absolutely has the freedom of choice. That is, a human creates their actions as a result of their choices either because they themselves have the capacity to do so (the Qadariyyah's doctrine) or because of the capacity Allah created for them (the Mu'tazilah's doctrine). The Jahmiyyah's doctrine finds that a human has no capacity at all, rather that a human is considered as an inanimate object and is absolutely driven by Allah, thereby, a human has no option except to do what they are compelled to do. The Sunnah's doctrine, however, finds that a bondman has only the intent accompanied by action. An example of the latter, when one intends to help others, Allah creates the capacity and the conditions facilitating to take the benevolence-aimed intended action. Even the intent, which drove one to help others, is predestined by Allah as a reward for those who try to fix themselves and be good.

The mental logic accepts and supports the trend the Sunnah's doctrine believes since the intent sometimes may take place before the action and vise verse. Indeed, the experience shows that there are cases where one intends to do something, but they cannot do it because of some reason, while there are other cases where one embarks doing something even though they had no intent to do it. Within the context revealed above, one can argue that a human has neither the freedom of choice nor is driven, rather that a human was characterized by a facilitated dynamic. This facilitation is at most the true meaning of the Qur'anic verses (91: 7–10), aforementioned.

The word of "*inspired it*," for example, those verses include means that Allah inspired the soul, pointed it out that there are two ways: piety and debauchery and facilitated it to proceed. This facilitation is a kind of access to the reward and punishment domain, so the Qur'anic verse (91: 9) shows that the truly successful one is the one doing their best to fix the self. The expression of "facilitation" was clearly expressed in other Qur'anic verses (92: 5–10): *As for him who giveth and is dutiful (toward Allah); And believeth in goodness; Surely We will ease his way unto the state of ease. But as for him who hoardeth and deemeth himself independent, And disbelieveth in goodness; Surely We will ease his way unto adversity.* Also, the expression of "facilitation" was expressed in the Hadith, a saying, action, statement (including the tacit one), and an ethical or physical character of the Prophet Muhammad (peace be upon him). Narrated 'Alī (may Allāh be pleased with him): *While the Prophet (peace be upon him) was in a funeral procession, he picked up something and started scraping the ground with it and said, "There is none among you but has his place written for him either in the Hell-fire or in Paradise." They said, "0 Allāh's Messenger! Shall we not depend upon what has been written for us and give up doing (good) deeds?" He said, "Carry on doing (good) deeds, for everybody will find easy to do such deeds that will lead him to his destined place) for which he has been created. "So, he who is destined to be among the blessed (in the Hereafter), will find it easy to do the deeds characteristic of such people, while he who is destined to be among the wretched ones, will find it easy to do the deeds characteristic of such people." Then he recited: "As for him who gives (in charity) and keeps his duty to Allāh and fears Him, and believes in Al-Husna." (V. 92: 5, 6)* (Sahîh Al-Bukhâri, vol 6, Hadith Number. 4949).

Consequently, from Islamic standpoint, discretionary behavior is defined as the behavior that is originally innate, but it is learnable over the time. Within Islamic view, one should not overlook that the voluntary behavior is a sub-behavior of the discretionary behavior. Whereas the discretionary behavior is available for use at the discretion of the doer, whether or not the doer is obligated to do the intended task, the voluntary behavior has no binding status. For example, the prayer, which is one of the five pillars of Islam one must do every day, is a binding discretionary behavior. That is, one is free to pray or not, but they will be charged for neglecting it in the hereafter. However, the following behavior the Prophet Muhammad (peace be upon him) engaged is an example of a voluntary behavior. Narrated Anas bin Mālik (may Allāh be pleased with him): *I took 'Abdullāh bin Abū Ṭalḥa to Allāh's Messenger (peace be upon him) to perform Tahnik for him. (Taḥnīk was a custom among the Muslims that whenever a child was born they used to take it to the Prophet (peace be upon him) who would chew a piece of date and put a part of its juice in the child's mouth). I saw the Prophet (peace be upon him), and he had an instrument for branding in his hands and was branding the camels of Zakāt.* (Sahîh Al-Bukhâri, vol 2, Hadith Number. 1502). By way of explanation, the Prophet Muhammad (peace be upon him) volunteered to do a job he was not obligated to do, but he did it since the job is in the interest of others by branding the camels of Zakat.

The volunteering work, however, including a form of harm is forbidden even if the volunteer has a sense of benefit. The following Hadith is an example of just that. Narrated An-Nu'mān bin Bashīr (may Allāh be pleased with them): The Prophet (peace be upon him) said, *"The example of the person abiding by Allāh's Orders and Restrictions in comparison to those who violate them is like the example of those persons who drew lots for their seats in a ship, Some of them got seats in the upper part, and the others in the lower. When the latter needed water, they had to go up to bring water (and that troubled the others), so they said, 'Let us make a hole in our share of the ship (and get water) saving those who are above us from trouble. So, if the people in the upper part left the others do what they had intended, all of them would be perished, but if they prevented them (from doing so), both parties would be saved."* (Sahîh Al-Bukhâri, vol 3, Hadith Number. 2493).

Within the context revealed above, one can argue that the benevolence values-driven discretionary behavior is always actually or potentially profitable to all individuals concerned, and that the individuals engaging in such discretionary behavior and recipients are always environmentally, not genetically, differentiated by environmental situations.

## Concluding Thoughts

The Qur'an cannot be translated, and the translation can never take the place of the Qur'an in Arabic, nor is it meant to do so (Pickthall 1930). Indeed, the existing translations of the Qur'anic verses stand for the interpretations of those words existing in the Arabic version and stand neither accurately for the meanings of those words nor the rhetoric of the Qur'an. Therefore, the future contributions stemming from Islamic perspective must be referred back to Islamic law-specialized Muslim scholars in order to expand the true knowledge and avoid wrong employing of the Qur'anic verses and the Hadiths, thereby, contribute to providing a reader a better understanding of this behavior.

Even though some discretionary behaviors reflect a human concern for conditions of work and individual welfare, it is a mistake to consider that all discretionary behaviors are good, therefore, should be encouraged in work organizations. A right behavior in one culture may be considered wrong in other cultures. What is hoped from future studies for is to further debate about this behavior and its characteristics from different cultures and in different organizational settings.

In closing, discretionary behavior is one of the topics far more complex than are generally considered, so criticisms about it may still on. For this

reason, the future works should add value to the research community and provide constructive criticisms showing how organizations can efficiently benefit from discretionary behavior.

# Disparity and Policy in Neighborhood Access to Financial Service Providers

Sean Hubbard
The University of North Texas at Dallas, Dallas, TX, USA

## Synonyms

Alternative financial services; Bank deserts; Economic inequality; Loan sharks; Predatory lending

## Definitions

*Financial Services*: lending, bank accounts, check cashing, bill pay, and money transfer services.

*Financial Service Provider*: a person or institution providing financial services.

*Neighborhood Access*: the presence of financial service providers in a defined geographic area.

*Disparity*: differences between neighborhoods in access to financial service providers.

Urban communities are a collection of different, and many times disparate, housing, educational, economic, health, and financial landscapes. The disparities in these landscapes manifest in the lack of quality jobs, housing, schools, grocery stores, etc., found in lower-income neighborhoods with larger non-white populations. Policymakers and researchers often refer to the low supply areas as deserts, then formulate policy meant to increase the supply of higher quality options in these deserts.

A look at the urban financial landscape reveals racial and economic disparities that reflect those found in other areas of urban environments. The disparity in the financial landscape presents itself

most prominently in the relationship between the racial and economic makeup of a neighborhood and differences in the number of banks found in those neighborhoods. In the most extreme cases, these disparities create a bank desert, defined by an apparent lack of financial services in some communities.

Since the 1960s, the focus of federal, state, and local policy responses to disparities in financial landscapes has been on creating equity in neighborhood access to banks and credit unions. These policies seek to encourage, through incentivization and regulation, increasing the presence of good financial service providers and decreasing the number of higher-priced providers in disadvantaged neighborhoods.

The question is whether nearly 80 years of location focused policy have reduced or eliminated disparities in the urban financial landscape. This chapter provides an in-depth look at the problem of neighborhood financial disparities, the history of policies meant to address these disparities, and the effectiveness of current policy approaches.

## Neighborhood Financial Disparities

Concern over disparities in financial access is not new. In fact, policies addressing financial disparities, particularly around credit, extend back 4000 years to the Code of Hammurabi. These early attempts at policy focused on protecting vulnerable borrowers from harmful practices such as excessive interest rates or usury. As financial services matured and diversified, the focus began to shift to differences in access to "good" vs. "bad" lenders. The terms "good" and "bad" are somewhat subjective ways to describe financial service providers. Generally, "good" providers are those providing financial services for lower fees, interest rates, and now report to credit reporting agencies. "Bad" financial services are those who charge higher interest rates, higher fees, and have coercive, sometimes violent, collections practices. At least in policymakers' eyes, the key difference is that "good" providers are helpful to their customers, while "bad" providers are harmful. In the modern urban economy, the "good" vs. "bad" dichotomy has become banks vs. alternative financial service providers, such as payday lenders, pawnshops, and check-cashing outlets.

These different types of financial services providers serve specific types of customers. "Good" financial service providers typically serve higher income and better-resourced customers, while "bad" providers serve lower-income customers with fewer resources. This pairing of certain types of financial service providers with specific customers is most easily seen in provider locations' geographic distribution.

The geographic distribution of financial service providers mirrors the economic and racial segregation of modern urban neighborhoods. Neighborhoods with a greater number of high income and white households will also have a greater number of "good" providers. Conversely, neighborhoods with a greater number of low to moderate-income (LMI) and non-white households will have fewer, if any, "good" providers. This relationship between the racial and economic makeup of neighborhoods and the geographic distribution of financial services creates two types of financial disparities.

The first type of disparity creates what is called a bank desert. Bank desert is the phenomenon in which low income, non-white neighborhoods experience a complete absence of financial services. This may be a lack of physical locations (Kashian et al. 2018) or specific services, such as mortgage lending, in LMI and non-white neighborhoods. While bank deserts can be a product of demand based decisions on the part of banks, they are often created through redlining, which is the practice of banks identifying neighborhoods to avoid based on their economic and racial makeup. Whether driven by market decisions or intentional discrimination, bank deserts leave LMI and non-white neighborhoods without essential financial services that are readily available in majority white, higher-income neighborhoods.

The second type of disparity is a difference in the types of financial services available rather than a complete absence of supply. As with the first type of disparity, financial services demand in majority white and higher-income neighborhoods is met with a sufficient supply of bank and credit

union services. In LMI and non-white neighborhoods, however, demand for financial services is met with fewer banks and a greater number of alternative financial service providers (AFSP) such as payday lenders, pawnshops, and check cashers (Barth et al. 2015; Damar 2009; Fowler et al. 2014; Gallmeyer and Roberts 2009; Graves 2003; Kubrin and Hipp 2014; Lee et al. 2014; Negro et al. 2014; Prager 2009).

While geographic disparities in banks and alternative lenders' location may suggest that individuals living in those neighborhoods face financial disparities, that disparity only exists if people living in different neighborhoods are using the providers associated with their neighborhood. There is a robust field of research to provide evidence that the racial and economic disparities in neighborhood access to financial services are also seen in the use of financial services.

Just as neighborhoods with higher non-white populations are more likely to have a greater number of alternative financial service providers, Black, Hispanic, and Native American populations are more likely than whites to use alternative providers (Johnson and Johnson 1998; Lawrence and Elliehausen 2008; Stegman and Faris 2005). Low- to moderate-income individuals are also more likely to use alternative providers, while those with higher incomes are more likely to use banks (Johnson and Johnson 1998; Lawrence and Elliehausen 2008; Stegman and Faris 2005). This means that differences in the geographic distribution of provider locations represent disparities in the use of financial services.

Given the extensive body of empirical work, few debate whether these neighborhood disparities exist. There is, however, significant debate over whether these disparities are a policy problem. For these disparities to justify policy intervention, they must constitute a public problem. To be a public problem, these disparities must create negative internalities or externalities, affecting a significant portion of the population. There is evidence that neighborhood disparities in access to financial services do create both negative internalities and externalities necessary to justify policy intervention.

The negative internalities of financial access disparities are the most frequently cited case of policy intervention. Those with access to only alternative financial services pay a much higher price for financial services than those with access to banks. Those who lack access to bank accounts often turn to check-cashing outlets, which charge 1.25–2% to cash paychecks (Manning 1999). The fees for an alternative loan can range from 15% per 30 days for a pawn loan to 15% for 2 weeks for a payday loan. This means those without access to banks pay between 200 and 400% APR, which is significantly higher than those with access to banks pay (Johnson and Johnson 1998; Lawrence and Elliehausen 2008).

The higher price of alternative financial services puts an additional strain on vulnerable households' budgets and often leads to a debt trap. Unable to repay the loans when due, LMI borrowers pay the interest and extend the loan for another period (Carter 2015; Skiba and Tobacman 2007). The higher price of alternative services and the potential for being drawn into the debt trap both worsen the financial situation for those in neighborhoods lacking access to banks.

One long-term consequence of alternative finance usage is an increased reliance on credit. Those who use alternative financial service providers are borrowing more frequently and spend a greater percentage of their income on debt payment than those who do not (Bos et al. 2012; Carter 2015; Johnson and Johnson 1998; Lawrence and Elliehausen 2008; Skiba and Tobacman 2007). The use of alternative financial services is also associated with difficulty paying regular bills such as mortgage or rent (Melzer 2011). In the most extreme cases, the result of alternative financial services is a higher rate of Chapter 13 bankruptcy fillings (Johnson and Johnson 1998; Skiba and Tobacman 2007).

Beyond the harmful effects that may worsen individual finances, disparities in the financial landscape create negative externalities that may worsen neighborhoods and have consequences for those not using alternative financial services. Evidence suggests that the presence of payday lenders and pawnshops increases the neighborhood crime rate (Kubrin and Hipp 2014). Pawnshops, perhaps due to the requirement of physical collateral, have long been associated with

property theft. Authorities have long sought to combat the use of stolen goods in pawn transactions (Fass and Francis 2004). More recently, the question has arisen as to whether the presence of payday lenders and check-cashing outlets increases the neighborhood crime rate. While the research is limited, early results suggest that the presence of payday lenders and check cashers may be associated with increases in both property and violent crime (Kubrin and Hipp 2014; Lee et al. 2014). If the presence of alternative financial services providers is correlated with higher crime rates, this suggests that neighborhood financial disparities disadvantage the individuals who ultimately use those services and negatively impact others in the neighborhood who may become victims of crime.

It seems clear that there is some direct or indirect relationship between disparities in neighborhood financial access, and the well-being of those living within these neighborhoods.

The presence of these negative internalities and externalities resulting from disparities in neighborhood access to financial services makes a compelling case for public policy intervention. The question is then how to best either reduce these disparities or mitigate their effects.

## Policy

Throughout history, policy has focused on the terms of financial transactions. Most often, this meant regulating the terms of loans. Babylonian, Christian, Jewish, and Muslim societies have all had various restrictions on loan terms (Homer and Sylla 2005). These historical regulations range from limitations on what can be used as collateral to outright prohibition of charging interest (Homer and Sylla 2005). Behind all of these policies is the goal of protecting vulnerable consumers from harmful terms offered by "bad" providers.

While current policies addressing financial disparities are still about protecting vulnerable borrowers from harmful practices, the focus has expanded from regulating terms to addressing the geographic supply of financial services. Driven by evidence of disparities in the geographic distribution of financial service providers, modern policy's goal is to adjust the supply of financial services by reducing the number of "bad" providers and increasing the number of banks and credit unions in vulnerable neighborhoods.

Policymaking for adjusting the supply of financial services consists of three approaches. Ranging from paternalistic to somewhat libertarian, these policy approaches involve increasing regulation of practices, banning alternative financial service providers, and increasing the supply of banks.

First appearing in the Code of Hammurabi, regulating the practices of financial services providers is the oldest approach to addressing financial disparities (Homer and Sylla 2005). Behind the regulatory approach is the idea that some groups of consumers have limited access to financial services and are exploited by "bad" providers. Policymakers then put limitations on the terms of financial transactions involving these providers.

In a modern context, vulnerable populations live in neighborhoods where the only financial service providers are payday lenders, check cashing outlets, etc. Policymakers believe that these alternative providers use the lack of bank access to take advantage of consumers by charging excessively high rates and fees. The local or state government then uses regulatory or legislative authority to create interest rate caps, fee limits and requiring interest rates to be displayed in terms of APR. While this approach is not a physical readjustment of the geographic distribution of providers, it aims to reduce neighborhood disparities in the price of financial services.

However, this approach has had limited success at reducing the use of alternative financial services and improving vulnerable populations' financial well-being. Several, states including Oregon, Arkansas, and Ohio, have taken the regulatory approach, and their efforts have ranged from ineffective (Ohio) to harmful (Oregon). In the case of Ohio, voters passed a ballot measure limiting interest rates to 28% APR. After the law, there was no reduction in the number of alternative lenders as lenders were able to use a loophole

to apply for a different lending license. In both Oregon and Arkansas, interest rate caps reduced the number of lenders and payday borrowing, but evidence suggests that these reductions were harmful to those policymakers sought to protect (Lukongo and Miller 2017; Zinman 2010).

A step up from regulation on the paternalistic policy scale is banning certain types of financial service providers. Behind policies that ban certain types of financial service providers is the idea that vulnerable populations become dependent on these types of financial services, and breaking that dependency requires removing those providers as an option. This approach focuses on adjusting the geographic distribution of financial services by removing alternative financial service providers in the hope that banks will replace them.

Relying on Spatial Void Hypothesis, the idea that alternative financial services are filling spaces where banks could be, the ban approach has been tried by states such as North Carolina and Georgia and some municipal governments. Bans in North Carolina and Georgia have been effective in removing alternative financial service providers, but evidence suggests the bans may have worsened the financial well-being of those who previously relied on those services. After Georgia's ban, the state saw increases in bounced checks, complaints about debt collectors, and Chapter 7 bankruptcy filings (Morgan and Strain 2008). In Arkansas, where the interest rate cap is effectively a ban on alternative lenders, customers, rather than switching to banks, began traveling to neighboring states to fill their financial needs (Lukongo and Miller 2017). With the additional transportation cost of traveling out of state, eliminating alternative finance only increased the price of financial transactions.

The third policy approach aims to increase the supply of banks through regulation or incentivization. This approach is based on the idea that due to either discrimination or economics, LMI and non-white neighborhoods are bank deserts. The goal is to adjust the geographic distribution of financial services by increasing the supply of banks in these neighborhoods.

Perhaps the first examples of the supply increasing approach are seen beginning in the 1960s. Primarily due to racial discrimination, majority-black neighborhoods lacked bank locations and certain financial services such as mortgage lending. Policymakers, seeing that these deserts were created by racial discrimination, took a regulatory approach to addressing neighborhood financial disparities. With the Fair Housing Act of 1968 and the Equal Credit Opportunity Act of 1974, the federal government sought to eliminate discrimination in the supply of financial services. The goal of these policies was not necessarily to increase the physical supply of providers but to equalize the supply of financial services.

With racial discrimination in the provision of financial services addressed, the federal government sought to address the neighborhood disparities in provider locations. Policymakers turned to an incentive-based approach to address the disparity in provider locations. The Community Reinvestment Act (CRA) in 1977 provided incentives for lending in LMI neighborhoods and was later amended with the Riegle-Neal Act in 1994, which removed restrictions on bank branching to encourage banks to open locations in underserved neighborhoods.

Recently, state and local policymakers have sought to build on the incentive approach to solving neighborhood financial disparities by creating banking development districts. As with other supply increasing policies, banking development districts are based on the idea that LMI and non-white neighborhoods are bank deserts. With banking development districts, policymakers incentivize banks to open in underserved neighborhoods by offering to deposit state and local funds in the institution below the market interest rate. First adopted in New York, the banking development district approach has been adopted by New Jersey, Louisiana, and Texas. While the banking development district program has been somewhat successful in reducing neighborhood disparities in the supply of financial service locations in New York, it has been mostly unsuccessful in other states (Neiman et al. 2010).

In some way, all of these policy approaches are meant to address neighborhood disparities in access to financial services. However, the results of these efforts have been limited success and, in some cases worsening the situation for those in

disadvantaged neighborhoods. This array of approaches' apparent ineffectiveness raises the question of why disparities in the financial landscape persist.

## Ineffectiveness of Policy

Disparities in access to financial services continue to be a significant problem facing policymakers. Evidence of their persistence is seen in both spatial analyses of neighborhood financial landscapes and profiles of consumers of different financial services. The answer to why these disparities exist despite significant policy efforts may be found in the differences between these neighborhoods and between different types of financial services.

High-income and LMI neighborhoods are made up of very different types of consumers. These consumers are likely to have different financial needs that are driven by several factors, including financial security and job stability. Profiles of payday lending and pawn customers reveal that users of alternative financial services are likely to be lower-income, experience less stable income, and are less likely to have savings (Johnson and Johnson 1998; Lawrence and Elliehausen 2008). This indicates that LMI populations may be more susceptible to economic shocks and lack resources on which they can draw to cover their expenses.

If LMI consumers are more likely to experience shocks and are less likely to have savings, they are also likely to need short-term credit. LMI consumers are more credit constrained than high-income consumers meaning obtaining credit from "good" sources is more difficult (Agarwal and Bos 2014). LMI consumers may be so constrained that no incentive may entice banks to serve them (Stiglitz and Weiss 1981).

If a neighborhood is comprised of consumers who, whether due to need/product mismatch or are not target customers for banks, then perhaps incentivizing or coercing banks to locate in these neighborhoods is bound to fail. Economic theory suggests that banks may always be resistant to serving these neighborhoods if they believe that they cannot profit (Berry 1992; Quint and Einav 2005). This may partially explain the ineffectiveness of supply increasing policies.

The decisions of banks are not the only reason for the ineffectiveness of past policies. Banks are more tightly regulated, particularly on price, than are alternative financial service providers. In most cases, these regulations make it impossible for banks to provide the sorts of services offered by alternative providers. If consumers in LMI neighborhoods have a need for specific services such as short-term loans or check cashing that banks cannot provide, there will be higher demand for firms that can provide these services. Unmet demand in LMI neighborhoods may explain the presence of alternative financial service providers in these neighborhoods.

Whether the explanation is choices by banks, demand/product mismatch, or some combination of these factors, it seems unlikely that current approaches to balancing the geographic distribution of financial services will reduce neighborhood disparities in access to financial services. Efforts to increase the supply are likely to remain ineffective, and efforts to ban or restrict "bad" providers are likely to worsen the disparities because neither approach accounts for the community's needs.

Future policy for addressing neighborhood disparities in financial access should focus on meeting disadvantaged communities' needs while reducing the price. The first signs of this approach to policy are beginning to appear. Some nonprofits, such as Community Loan Centers, offer products similar to those offered by alternative financial service providers at a much lower price. Sen. Elizabeth Warren has proposed allowing the US Postal Service to provide certain banking services. Others have proposed relaxing regulations so that banks can offer products that fit the needs of LMI communities. Any of these approaches may be more effective at reducing neighborhood disparities in access to financial services than our current set of policy approaches.

## Conclusion

Urban neighborhoods face disparities in their financial landscape, similar to disparities in other

areas such as food, healthcare, and education. Disparities in the financial landscape mainly follow the racial and economic makeup of these neighborhoods. Neighborhoods with larger low to moderate-income and non-white populations are likely to have fewer "good" financial service providers such as banks and have a larger number of "bad" financial service providers such as payday lenders and check-cashing outlets.

These disparities create harm to residents of these neighborhoods who rely on more expensive alternative financial service providers by further straining their budgets and leading them into a cycle of indebtedness. These disparities also create more financial distress and increase crime in the neighborhood, creating negative externalities that harm other residents who may not use these services. These problems create an urgent issue for urban policymakers.

Policymakers have spent decades trying to solve this problem through various approaches aiming to adjust the geographic distribution of financial services. These policy efforts, including regulation, banning, and increasing supply, have been mostly ineffective in addressing disparities in access to financial services. This ineffectiveness may be due to their focus on supply with little consideration to the needs of these communities.

A new approach to addressing disparities in access to financial services has begun to enter policy conversations. This new approach focuses on demand by considering the difference in financial needs between different communities. Demand-centered approaches may provide a path for urban policymakers to address neighborhood financial disparities in a way that improves the well-being of the people who live in disadvantaged neighborhoods.

# Disparity in Government Procurement

Christopher L. Atkinson
Walden University, Minneapolis, MN, USA
School of Public Administration, Florida Atlantic University, Boca Raton, FL, USA
School of Public Administration, Florida Atlantic University, Fort Lauderdale, FL, USA

## Synonyms

Disadvantaged business enterprise; Diversity and inclusion programs; Level playing field; Minority-owned business enterprise; Women-owned business enterprise

The author has served as a local government project manager on a county-level disparity study project.

## Definition

Compelling interest: exists where "government's interest in the law and its purpose" is very strong when compared with "an individual's constitutional right that is affected by the law" (Garner 2006, p. 121).

Disparity: availability of firms, usually socially and economically disadvantaged business enterprises, minority-owned business enterprises (MBE), or women-owned business enterprises (WBE), does not equal utilization in the procurement operations of an entity, usually governmental.

Disparity study: a research product that evaluates "statistical and anecdotal evidence of discrimination against M/WBEs to allow state or local policy makers to determine whether there was a 'strong basis in evidence'. . .to adopt race-conscious remedies" (Wainwright and Holt 2010, p. 11).

Disparate impact: "A test or other tool used for selection that, though appearing neutral, actually has an adverse effect on a particular protected class of individuals" (Legal Information Institute 2016a).

Disparate treatment: intentional behavior that is discriminatory.

Narrow tailoring: means "no broader than absolutely necessary" (Garner 2006, p. 474).

## Introduction

In the American Bar Association's model procurement code (2000), support of and assistance to small and disadvantaged business enterprises is highlighted as one of two chapters (the other being ethical standards) serving as additions to basic procurement policy. The model code's inclusion of such language recognizes the place of socioeconomic policies in state and local government procurement, and the frequency that locales engage in addressing the need for inclusiveness in vendor selection and, possibly, are working to alleviate the effects of inequality in procurement. From the year 2000 when the model code was drafted to today, there has been a shift

D

from adoption of programs designed to alleviate procurement disparity, to programs giving preference, for example, to local businesses as part of an economic development program, with the intent to maintain or increase local employment and community investment. This is not to say that discrimination on the basis of race and gender has been alleviated society-wide – this is sadly not the case. However, such development programs have a lower standard of legal review, are easier for local governments to defend, and can potentially benefit small businesses, including minority and women-owned businesses, considerably. Nevertheless, race-conscious programs exist today, created and implemented to address the impacts of discrimination.

This entry considers the concept of parity in government procurement, the compelling interest of government in achieving parity, an overview of a disparity study, and concludes with considerations for the future of disparity studies in public procurement.

## Parity in Government Procurement

Ideally, government enacts policy because inequality has been experienced or market failure has occurred (Arshed and Carter 2012). It is thought that "Under a fair and equitable system of awarding subcontracts, the proportion of subcontractors and subcontract dollars awarded to M /WBEs should be relatively close to the proportion of available M/WBEs in the relevant market area" (Mason Tillman Associates 2012, p. 8–1). However, as the Supreme Court opined in the Adarand v. Mineta, 534 US 103 (2001) "Congress has found that many Americans, because 'of their identification as members of certain groups that have suffered the effects of discriminatory practices or similar invidious circumstances over which they have no control,' lack equal 'opportunity for full participation in our free enterprise system', and thus are 'socially and economically disadvantaged' on account of race or ethnicity."

The United States Federal government has instituted programs for minority contracting since 1977, with the Public Works Employment Act of 1977 (Fullilove v. Klutznick, 448 US 448 1980). Scrutiny at the time for such programs was closer to an intermediate standard – the program was determined to serve an *important objective of government* and the program itself was *related to the objective* of increasing minority participation in government contracting. A current program with particularly wide use, given its interaction with state and local entities, is the US Department of Transportation disadvantaged business enterprise (DBE) program (49 CFR 26). The DBE program, in place in various forms since the 1983 (USDOT 2015), has been a periodic legal flashpoint for argument and increased understanding of how programs intended to address disparity are instituted and how they work in practice.

The central notion of affirmative contracting programs is that previous discrimination likely lessened the ability of minority contractors to compete effectively against other contractors and that as minority contractors gain work and are awarded contracts, they gain capacity that allows them not only growth in the short run but the ability to compete more effectively over the longer term. This is, through affirmative action, a form of recompense of previous discrimination, through the amelioration of present competitive standing in public procurement (Martin et al. 2007). State and local programs are in many ways fashioned on Federal programs designed to address prior discrimination, either on the part of government as a passive participant or through studies that identify government itself as discriminating against disadvantaged businesses.

## Compelling Interest, Strict Scrutiny, and Narrow Tailoring

City of Richmond v. J.A. Croson Co., 488 U.S. 469 (1989) required the establishment of a "compelling interest" in "apportioning public contracting opportunities on the basis of race"; the majority opinion utilized a standard of strict scrutiny given the presence of race in directing government policy. In *Croson*, the Court wrote

that "It is beyond dispute that any public entity, state or federal, has a compelling interest in assuring that public dollars, drawn from the tax contributions of all citizens, do not serve to finance the evil of private prejudice." However, the mere statement of the need for governments to avoid becoming a "passive participant" in private sector discrimination does not allow for passage and implementation of overarching programs for minority contractors, society-wide. The Supreme Court more firmly established the need for strict scrutiny in the *Adarand* case in 1995, after some hesitance in the form of an intermediate standard for *benign* use of race in the case of Metro Broadcasting, Inc. v. Federal Communications Commission, 497 U.S. 547 (1990). In doing so, they rejected arbitrariness in the establishment of minority contracting goals within public procurement programs. From that point forward, the identification of specific disparity was required to institute affirmative programs that considered race/gender in contracting. Resultant goals for minority and women-owned business contracting must therefore be narrowly tailored to address specific disparity.

## Disparity Studies

A disparity study intends to show whether or not past discrimination has occurred in a government's procurement operations; assuming that it has, the study identifies areas where underutilization has occurred and makes recommendations for how the commissioning entity can enact policy or change practices to help resolve the identified disparity. The purpose is to provide an evidentiary basis and documentation of "how well an organization has involved small and minority owned businesses and to what extent, remedial programs for racial or gender discrimination are appropriate" (MGT of America 2012). The studies' "statistical analyses, combined with anecdotal and other evidence of discrimination, have been used almost universally as the legal support for minority contracting programs at the state and local levels" (Martin et al. 2007, p. 513). Disparity studies are commissioned to answer a variety of questions: Can discrimination be documented? Did government participate in this discrimination? Were race-neutral measures used successfully? Can solutions be formulated that portend to resolve the problem(s), narrowly defined? (Martin et al. 2007). A disparity study is typically conducted by a third-party consultant or educational institution.

A disparity study typically includes a review of relevant case law, a calculation of the entity's relevant market area (where the entity buys most of its products and services), the sorts of products and services most relevant to identifying purchasing patterns, estimates of potential availability of MBE and/or WBE firms, comparison of dollars spent in total with dollars spent with MBE and WBE firms as prime contractors/consultants and subcontractors/subconsultants, the calculation of *disparity ratios*; comparison with private sector buying behaviors, analysis of "access to capital and credit" for disadvantaged businesses (Wainwright and Holt 2010, p. 12), qualitative analysis of "anecdotal evidence" (p. 12), consideration of policy measures that do not include race and gender factors (what are called "race-neutral" approaches), and inquiry into existing programs and recommendations for how those programs might be improved (Wainwright and Holt 2010).

Disparity studies are not without concerns; their use and basis can be subject to disagreement. Studies may be conducted differently by a variety of providers. In the directing of a study, a number of problems may occur: The data needed for the study may not be available; information may not be sufficiently centered on the locale in question; sources of information might be inconsistent; and definitions of "minority-owned business" might not be consistently used. Even when disparity is found in public procurement, this does not necessarily mean that discrimination has occurred (Martin et al. 2007).

Disparity studies tend to recommend a fairly typical list of "remedies" to address disparity, once identified. These include goal-setting programs to apportion a specific part of contracts to minority or women-owned firms; these may be fashioned as percentage goals and are tied to disparity as identified in the study document. Studies

recommend race-neutral measures, including enhanced opportunity for small businesses generally to compete for and be awarded contracts, outside the open market, in what may be referred to as sheltered market opportunities. Studies might recommend the creation of mentor-protégé programs, to assist small and minority/women-owned businesses in increasing their knowledge and capacity to compete, with the counsel and guidance of a larger business with established capacity in a related industry. Disparity studies usually recommend governments collect contracting data with consistency and purpose; study consultants are able to work more effectively with a locale's data when all the data points are available, including full lists of subcontractors, whether certified in a locale's small business program or not. When data collection is not supported, costs associated with disparity studies, which are considerable, can increase markedly (Martin et al. 2007).

As race-conscious programs are challenged, study consultants may opt to recommend race-neutral programs. These programs seek to encourage the development of small businesses generally; as a result, they do not present issues of equal protection (Legal Information Institute 2016b). There has been a marked advance of programs requiring a lower "rational basis" standard of legal review, in the form of development programs, over programs designed to address disparity. These programs avoid the strict scrutiny standard and do not require narrow tailoring to address identified discrimination.

## Conclusion

As a normative consideration, the inclusion of all businesses in public procurement remains an important belief. The principle of an equal opportunity to compete for and be awarded contracts is an important aspect of governmental contracting, given the use of taxpayer resources. As long as discrimination exists in the public marketplace, including where government purchasing is touched by discrimination in the surrounding community, government has a compelling interest in addressing it or at the very least not contributing to further discrimination. Parity in public procurement, therefore, remains a consideration for governments at all levels, particularly where a history of discrimination exists.

## Diversity and Its Management in Organizations

Lotte Holck and Sara Louise Muhr
Department of Organization, Copenhagen Business School, Copenhagen, Denmark

### Synonyms

Heterogeneity in organizations

### Definition

Diversity refers to understanding uniqueness of individuals within organizations.

### Introduction

Due to increased workforce mobility, migration, and internationalization of education curricula, diversity in the workforce in terms of social identity categories such as gender, race, ethnicity, age, and sexual orientation has become a prime concern for today's organizations in both the public and private sector. In today's globalized world, organizations need to attract and maintain a diverse workforce to make use of its differentiated knowledge, skills, and capabilities (Ortlieb and Sieben 2014; Romani et al. 2016; Janssens and Zanoni 2014). Diversity in the workforce can be defined in terms of social identity categories such as gender, race, ethnicity, age, and class and has become a prime concern for organizations in both the public and private sector because today's globalized organizations need a diverse workforce in terms of knowledge, skills, and abilities (Benschop et al. 2015). Diversity as a term has assumed preeminence over recent decades as a way of representing populations that diverge through a wide variety of age related, cultural, ethnic, racial, national, linguistic, religious, physical and mental strengths or weaknesses, gender, and sexual identifications or positionings. Diversity at the organizational level is often neutrally referred to as "the composition of work units (work group, organization, occupation, establishment, or firm) in terms of the cultural or demographic characteristics that are salient and symbolically meaningful in the relationships among group members" (DiTomaso et al. 2007, 474). However, critical diversity scholars question this presumable straightforward, unproblematic, and power-void definition of diversity advocated especially among mainstream diversity scholars. On the contrary, critical scholars highlight how diversity is a "slippery and equivocal term, which scholars and practitioners use in different ways" (Just and Remke 2012, p. 138). In a more critical perspective, diversity can also be interpreted as the "salient and symbolically meaningful" in relation to dynamics of power. This is what Mamman et al. (2012) refer to as a "low status minority" that can apply to any category of employee, irrespective of such elements as gender, ethnicity, nation, sexuality, physical ability, and other factors deemed relevant. Critical scholars furthermore emphasize how the salience or relevance of the *status* of any category of employees depends on the historical and societal setting (Mamman et al. 2012). Diversity *management* can therefore be defined as the part of the diversity literature explicitly concerned with the practical application of how differences are and should be managed in organizations and to what ends (e.g., Holvino and Kamp 2009; Tatli and Özbilgin 2012).

To give an overview over the way issues of diversity management are theorized and analyzed in an organizational setting, this entry is structured as follows: First the historical backdrop of the development of the concept of diversity management is drawn up. Then the two prevailing discourses of diversity management – the discourse on social justice and the discourse on the business case – are explicated. Finally the management of

workforce diversity in a corporate context is discussed as a part of human resource management practices in the organization.

## Historical Backdrop of the Development of Diversity Management

Diversity management originates from North America. It is rooted in the anti-discrimination movement of the 1960s but coined as an independent concept in the 1980s. For decades the diversity debate in USA was focused on legislative issues such as affirmative action (AA) or equal employment opportunities (EEO). Affirmative action refers to hiring quotas designed to increase the proportion of employees from minority groups typically to make up for past discriminative hiring practices. Equal employment opportunities cover how policies are made to guarantee access to job interview and more broad development and qualifications initiatives. Fuelled by the Workforce 2000 report on changing demography of the US labor force, however, diversity management literature – as well as practice – took a new turn and began to investigate the "business case" of successfully integrating an increasingly diverse labor force (Jonsen et al. 2011). The business case approach to diversity management entered the management discourse with a critical distance to its predecessors' affirmative action and equal employment opportunities advocating a legal focus (cf. Holvino and Kamp 2009). While AA and EEO activities were seen to reduce the negative effect of exclusion and social stratification (on the labor market and in the corporations), diversity management in a business case perspective was meant to pave the way for managing differences proactively by promoting the positive effects of inclusion within the organization (Jonsen et al. 2011). While AA/EEO represented a legal and moral social justice imperative, diversity management employed the rationale of competitive advantage, human resource utilization, and the business imperative to enhance organizational productivity and profitability with a focus on discretion and voluntary action on behalf of the corporations (Cox 1993; Herring and Henderson 2012; Kalev 2009; Noon 2007; Oswick and Noon 2014; Thomas and Ely 1996). In other words, the arguments for diversity shifted from being around whether it was the right/fair thing to do to the fact that organizations could benefit economically from having diverse teams – at shop floor as well as management level.

AA and EEO programs of the 1960s, 1970s, and early 1980s had according to several scholars proved insufficient (Kalev et al. 2006; Kelly and Dobbin 1998; Muttarak et al. 2013; Oswick and Noon 2014; Shore et al. 2009), and it has been argued that their failure to achieve enhanced organizational inclusion of hitherto disadvantaged minorities presumably was due to insufficient involvement and commitment by managers (Janssens and Zanoni 2014; Tomlinson and Schwabenland 2010). The business case perspective on diversity management was therefore also formulated as a response to this and thus as a way to commit senior management. Diversity management was then to provide a powerful set of arguments by means of the "business case" for diversity with which to persuade and mobilize management interests in the needs of the marginalized minority labor (Kandola and Fullerton 1998). The business case is based on the idea that a diverse workforce can be a valuable asset for organizations if correctly managed, presenting diversity management as a way to value unique competences of a diverse workforce and to create a win-win situation for employer and employees (Thomas and Ely 1996; Zanoni 2011).

## Two Competing Discourses: Business Case or Social Justice

The managerial diversity management proponents of the "business case" and the critical diversity scholars advocating social justice have hitherto polarized the field of diversity research and created two strong – but competing – discourses on diversity management. The shift from AA and EEO to the business case perspective implied a move from legislative commitment to voluntary company initiatives – a way for companies to be proactive and take control instead of reactively

applying to a legal framework (Özbilgin and Tatli 2011). The business case fuelled a more voluntary and discretionary approach to diversity making it easier to link employee diversity to business strategies and innovation in firms. The shift also implied a move beyond the discrimination and equality debate and away from group-based differences and intergroup inequalities to a focus on the attribute of individuals – and adopted because it made business sense in an increasingly ethnocultural and globalized economy (Jonsen et al. 2011; Klarsfeld et al. 2012; Kelly and Dobbin 1998; Noon 2007; Tatli et al. 2012).

The frontier then polarized along on the one side, functionalistic diversity management scholars promoting a broad set of individualized differences including all conceivable elements like personality traits, physical characteristics, and cognitive capacities in addition to the traditional "big five" (ethnicity, gender, age, physical ability, religion, and later on sexual orientation (cf. Ashcraft 2011; Thomas and Ely 1996)). On the other, the business case keeps critical diversity scholars busy deconstructing the very same as managerial rhetoric serving to conceal the widespread realities of unequal power relations along sociodemographic identity axes manifest in, i.e., enduring wage and promotion inequality in organizations (Ahonen et al. 2014; Embrick 2011; Kalev 2009; Kalev et al. 2006; Oswick and Noon 2014). They perceive the showcasing of the business case as corporate efforts to push the question of power aside (Ghorashi and Sabelis 2013).

This individualization of differences is combined with a focus on explicit and measurable aspects of diversity backing up the business case rhetoric of how diversity pays off (Embrick 2011: 545). According to Embrick, the increasing vagueness of the definition of diversity with the broadening of the term also becomes a minimization or neglect of issues pertaining to racial/ethnic or gender diversity:

> By increasing the number of categories of people that fall under the umbrella of diversity, companies are able to effectively escape close examination of racial and gender inequalities that might occur in their workplace. As long as no one brings it up, it can be ignored. . .The diversity ideology emerged in the late 1960s that has helped corporations become increasingly sophisticated in their ability to portray themselves as supporters of racial and gender equality, while simultaneously they make no real substantial changes in their policies and practices to create real changes in the racial and gender composition of their workplace. (Embrick 2011: 544–5).

The business case aims at demonstrating diversity as a strategic asset of the business focusing on the uniqueness potential of different members while sidestepping the inequality and power dimension of the organization. However, the minority groups are still predominantly perceived as *different* from those representing the norm and "classified and categorized" according to race, ethnicity, gender, and age and to a lesser degree class, sexual preferences, education, and disabilities (Muhr and Salem 2013; Risberg and Søderberg 2008: 427).

The difficulties of grappling with the issue of "valuing difference" and the tendency to combine "difference" with otherwise marginalized groups on the labor market have led to a critique of diversity management as reinforcing stereotypes of especially ethnic minorities and women in a corporate setting (Syed and Özbilgin 2009; Tatli and Özbilgin 2012; Zanoni et al. 2010). The calculative dimension of the diversity business case also brings along a representative logic of "counting" difference, which again can lead to stereotypical categorizations of employees and essentializing of difference. Others again criticize diversity management as a means to gloss over and "dissolve differences" in pursuit of harmonious corporate integration and profitability by integrating a wider variety of categories (Holvino and Kamp 2009; Muhr 2008; Noon 2007; Tatli and Özbilgin 2012; Tomlinson and Schwabenland 2010).

The coexistence of inclinations to simultaneously dissolve and highlight, and to individualize and essentialize differences along social identity groups, brings together two conflicting logics when dealing with diversity both underpinning mainstream diversity management and the critical diversity research. The critical line of diversity literature has in particular focused on deconstructing and de-essentializing the notion
